Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Getting the Most from the Index

THIS is essentially a subject index, not an index of titles, and articles treating a number of different subjects are listed under each of them. In addition, a geographical reference is published wherever the article relates to any particular railway company, city, state or nation. Entries about an electric railway are under the name of the city in which the main office of the company is located.

In the subject index, the alphabetical method is followed. If there is a choice of two or three keywords the one most generally used has been selected, cross references being supplied. The headings which appear in the index itself are in small type under the general classifications. The main headings in capitals below do not appear in the index.

As an example of how to use the index, if a reader wishes to locate an article on special trackwork he obviously would look in the list below at the general subject "Track." Under this caption, only "Special trackwork" could apply to the article in question.

The large number of articles brought out on the monthly maintenance data sheets, together with the increasing number of maintenance notes in other issues has resulted in the substitution of three keywords, for indexing items formerly appearing under "Repair shop practice": (1) Maintenance data, under which all articles appearing on the monthly maintenance data sheets are grouped; (2) Maintenance equipment, with classified subheads, under which all articles in the weekly department "New Equipment" are included, and (3) Maintenance practice, also with classified subheads, under which all articles in the weekly department "Maintenance Notes," as well as the articles on the data sheets, are inserted. The heading "Repair Shops and Equipment" has been reserved for general articles on the design of repair shops and their equipment. Otherwise the plan used for many years in the preparation of this index has been followed.

In addition to the groups of articles covered by these headings, papers and reports from railway associations are grouped under the names of the various organizations. Proceedings of other associations and societies are indexed in general only in accordance with the subject discussed.

Signed articles also are indexed by the name of the author. When the name of the author is known to the reader this provides the simplest method of locating any article.

CLASSIFIED LIST OF KEYWORDS

ACCIDENTS AND ACCIDENT PREVENTION
Accident claim department
Accident prevention
Accidents (including wrecks)
Insurance, Fire
Safety work
Storm and fire damage

ELECTRIC CARS AND SERVICE CARS
Cars (including car design)
Locomotives
Service and tower trucks
Trackless trolley

CAR EQUIPMENT
Bearings
Brakes and compressors
Doors, car
Electrical equipment for cars (except motors)
Gears and pinions
Heaters, electric
Lighting and lighting fixtures
Motors, Electric
Resistors
Seats
Trolley wheels
Trucks
Wheels and axles

EMPLOYEES
Education
Employees
Insurance and pensions
Labor
Strikes and arbitrations
Wage decreases
Wage increases
Wages and working agreements

FARES
Fare collection (including apparatus)
Fare decreases
Fare increases
Fares
Traffic investigations
Traffic stimulation

FINANCIAL, LEGAL AND STATISTICS
Accounting
Appraisal of railway property
Blanks and forms
Discontinuance of lines
Financial (methods of financing)
Financial reports
Franchises
Insurance, Fire
Insurance and pensions

Taxes

HEAVY ELECTRIC TRACTION
Heavy electric traction (general)
Locomotives

MAINTENANCE OF EQUIPMENT
Car cleaning
Lubrication
Maintenance data
Maintenance equipment
Maintenance practice
Motor buses, Practice with
Painting
Repair shop practice; cars and car equipment
Repair shop practice; shop methods and equipment
Repair shops and equipment
Stores
Tests of materials and equipment
Welding

MOTOR BUSES
Motor buses, design
Motor buses, gas-electric
Motor buses, installations
Motor buses, jitney competition
Motor buses, Operating practice
Motor buses, regulation

POWER
Energy checking devices
Energy consumption
Fuels

POWER—Continued
Overhead contact system
Power distribution
Power generation
Power stations and equipment
Power transmission
Substations and equipment

STRUCTURES
Bridges
Carhouses and storage yards
Loading platforms
Power stations and equipment
Repair shops and equipment
Substations and equipment
Terminals and waiting stations

TRACK
Pavements
Rail joints and bonds
Rails
Special trackwork
Ties
Track construction
Track maintenance

TRAFFIC AND TRANSPORTATION
Advertising
Customer ownership
Dispatching
Freight and express
Interurban railways
Merchandising transportation
Parking of cars
Publicity
Public, Relations with
Rapid transit (elevated and subway)
Schedules and timetables
Signals
Street traffic congestion
Traffic investigations
Traffic regulation
Traffic stimulation
Transportation, Metropolitan (general studies)

MISCELLANEOUS
European practice
Management
Noise reduction
Railway construction proposed
Railways (general)
Snow and ice removal
Standardization
Wood preservation

—Pueblo, Colo., Methods, Details, *231.
—Richmond, Va.:
Award for, 332.
Stock sale advertised, *404.
—Salt Lake City freight service advertised [Needham], *196.
—Utilities Advertising Association to study stockholder contact, 329.
—Youngstown, Ohio, Utility service advertised, 298.

Africa:
—Buses installed in Beira, 416.
—Electrification in Natal, South Africa, 416.

Airplanes:
—Chicago, Ill., Airport service, 1007.
—Cleveland, Ohio; Rail-air service connections established ,914.
—Detroit, Mich., Railway cooperation with, 836.
—Louisville, Ky., Services planned, 1082.
—New York-Los Angeles train-airplane service, Comments on, 845.

Akron, Ohio:
—Northern Ohio Power & Light Co.:
Bus line purchased, 136.
Bus service increased, 375, 516.
Canton abandonment sought, 219.
Detroit-Pittsburgh bus service, 516.
Fare increase, 131, 513.
Financial report, 716.
Personnel changes, 920.

Alabama Power Co. (See Birmingham, Ala.)

Albany, N. Y.:
—Capitol District Transportation Co.:
Financial report, 639.
—United Traction Co.:
Financial report, 639.
Paving relief bill requested, 133.

Allentown, Pa.:
—Lehigh Valley Transit Co.:
Billboards used to prevent accidents, *774.

Alliance, Ohio:
Stark Electric Ry.:
Bus competition curbed, 594.
Electrical equipment sold, 258.
Financial report, 380.
Improvement program, 306.
Refinancing plans, 98.
Weekly pass increases business, 174, 872.

Altoona, Pa.:
—Altoona & Logan Valley Electric Ry.:
Modernization program, Details, *498.

American Electric Railway Accountants' Association:
—Committee activities:
Stores accounting, *629, 868.
—Committee appointments, 249.

American Electric Railway Association:
—Advertising section distributes posters, *208.
—Annual convention:
Executive committee resolutions, 223.
Exhibitographs, 343, 485, 683, 759, 925, 1095.
Exhibit space, *718; Assignments, 882; Comments on, 845.
Records of, 1916-27 [MacMurray], * 73.
Space applications for exhibits, *603, 643.

American Electric Railway Association:—Annual Convention (Continued)
—Better Copy Contest entered, 292.
—Bureau of information:
Bulletins, 1001.
—Committee activities:
Current collecting devices, 1001.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review
Published by McGraw-Hill Publishing Company, Inc.
CHARLES GORDON, *Editor*

Volume 71 New York, Saturday, January 7, 1928 *Number 1*

ELECTRIC RAILWAY JOURNAL is a consolidation of *Street Railway Journal* and *Electric Railway Review*, effected in 1908.

In November, 1884, *Street Railway Journal* began publication, having been started a few months earlier as the street railway department of the *Journal of Railway Appliances*. The new paper was edited during various periods by Robert Grimshaw, George L. Fowler, Emerson P. Harris, C. B. Fairchild and Edward E. Higgins.

In May, 1908, *Electric Railway Review* was purchased and consolidated with *Street Railway Journal* to form ELECTRIC RAILWAY JOURNAL. Henry W. Blake, who joined the staff of *Street Railway Journal* in 1891 and in 1894 became its editor, continued as the editor of ELECTRIC RAILWAY JOURNAL until 1925, when he was made senior editor. Harold V. Bozell was co-editor from 1920 to 1922 and Harry L. Brown was co-editor from 1923 to January, 1925. Charles Gordon became editor in February, 1926.

The present staff is as follows: Editor, Charles Gordon; managing editor, Morris Buck; senior editor, Henry W. Blake; editorial staff, John A. Miller, Jr., Clarence W. Squier, George J. MacMurray, G. W. James, Jr., C. A. Faust and L. H. Church (Chicago). Paul Wooton is Washington correspondent and Alex. McCallum is London editorial representative.

A Demonstration of the Good Business of Good Service

AN ANALYSIS of the progressive program followed by the Georgia Power Company in its effort to give Atlanta "The Best in the Nation" in transportation service was published in last week's issue of the JOURNAL on page 1180. The opening paragraph of that article said:

> Confident that new cars and, therefore, better service are the real answer to increased revenue and the ultimate support of the public, the Georgia Power Company, Atlanta, Ga., and its predecessor company, the Georgia Railway & Power Company, have been buying cars steadily since 1921, in the face of a declining curve of earnings on the investment. Some idea of the extent to which the present company believes in better service is gained from the knowledge that it has spent over five million dollars in service improvements since 1921, and the budget for 1927 adds more than a million and a quarter dollars to that already invested.

It is an unusual coincidence that in the same issue of the JOURNAL, on page 1201, there is published an abstract of the opinion and order by the Georgia Public Service Commission granting the Atlanta company a fare schedule of 10 cents cash, four tickets for 30 cents, or twenty for $1.50. In support of this fare order the commission points out that the company is rendering the best railway service in its history. There was little organized opposition to the fare increase in the hearings before the commission.

Here, then, briefly is the history of what has been happening recently in Atlanta. It represents one of the brightest pages in the record of the march of electric railways toward better days. It is of more than passing interest, therefore, to look behind the record itself for the policy which has guided this company's management during the past several years. One does not need to look far. In the introduction to its brief filed last year in the Coffin competition the company sets down this policy under the heading, "Our Story at a Glance":

> A determined effort to give Atlanta the "Best in the Nation" in transportation service, in the confidence that this would win public patronage and support.
>
> Continuation of this policy for several years in spite of the fact that losses not only continued but increased—and then in 1926 an upturn in the curve of return on the investment!

That was Atlanta's creed. The management expressed and demonstrated its confidence that the public would patronize and support its service if the service was of sufficiently high quality to deserve patronage and support. It hung to this policy and continued to make large investments in new facilities over a period of several years, while losses not only continued but actually increased. It drew comfort at last from the fact that there was finally shown a slight increase in the return on the investment. But the recent commission order now demonstrates the soundness of the company's policy to the owners of its securities and to the industry in so convincing a manner that even the most skeptical and faint hearted must be convinced.

The JOURNAL extends its sincere congratulations to the Georgia Power Company. Atlanta enjoys no special advantages in comparison with other cities. What has been done there can be duplicated on many other properties. The Atlanta story portrays a brand of management courage and vision of which the electric railway industry can well use a large portion. Here is faith in the transportation business that serves as a shining beacon to those who have looked on the future with doubts and misgivings. Here is a demonstration of the good business of good service.

A $40,000,000 Program for the Boston Elevated

IF THE program of the Division of Metropolitan Planning of the Metropolitan District Commission at Boston is approved by the Legislature the status of the Boston Elevated Railway will be changed greatly. In the first place the division favors the expenditure of $40,000,000 for two new rapid transit lines and for the extension of the Washington Street rapid transit route. This is all presaged, of course, on the extension of the public control act. The division would extend the period of public control for fifteen years, but it would modify the terms.

Both of these matters were before the state legislative body in 1927. No disposition was made of them then, but enabling legislation has since been secured which is

Digitized by Google

deemed advantageous under the present conditions. Moreover, the Supreme Court has decided that betterments may be assessed against property benefited by rapid transit line extensions.

Under the plan now advanced the name of the company would be changed to the Boston Transit Company so as to be more nearly indicative of the real status of the enterprise. The financial set-up of the company would be changed, with certain bonds carrying the guarantee of the state. Not the least interesting of these proposals is the suggestion that the three classes of preferred stock now outstanding be exchanged for 4 per cent income bonds, it being felt that a 4 per cent tax-free income bond with a guarantee of the commonwealth can be sold at par and offers a suitable medium of exchange for the holders of the various classes of preferred stocks. The investment plane to which the securities of the company have risen under the plan of operation by the trustees is attested by the market quotations, particularly of the first preferred stock, which is selling at 113.

So far as the company is concerned the changes suggested would save $1,175,000 a year on the basis of its present capitalization and earnings. The plan also provides for the liquidation of the $2,200,000 now owed by the Elevated to the cities and towns served by it and advanced through the commonwealth to the company to meet the guarantees of the public control act when its earnings were insufficient.

The plan, of course, is tentative. It may or may not be modified in its essentials. One thing it does do, however. It makes distinctly articulate the demand from some quarters that the essentials of the plan of operation which has been in effect for the last ten years be perpetuated.

But these ideas merely reflect the thought of one group of partisans. As a matter of fact, with regard to the control of the Boston Elevated property, three schools of opinion are coming to the front: (1) A group advocating the return of the property to private management under the commission regulation imposed upon other utilities; (2) a group seeking immediate public ownership of the road through purchase from the stockholders, and (3) an extension of the public control period under a plan which would probably require the stockholders to accept a lower dividend return than that guaranteed by the act of 1918.

Only a few days ago Eliot Wadsworth, formerly of Stone & Webster and latterly Assistant Secretary of the U. S. Treasury, issued a pamphlet in which he made out a strong case against the continuance of state trusteeship and vigorously advocated a return to private management. He pointed out that the property has been self-supporting for seven years; that it can and should be run in the future on the principle of service-at-cost, and that this can be done without further commitment of the state treasury to making up operating deficits, which amounts to giving the trustees an unlimited expense account through their right to levy taxes on the metropolitan district.

Mr. Wadsworth maintains that the need of the public control act of 1918, passed under war conditions, has long since vanished; that the trustee plan has failed as a method of money raising, and that much-needed extensions of the Boston subway system are practically impossible under existing conditions. The improvement of service under public trusteeship has been largely due to the establishment of adequate rates, and it is held that under private management and state regulation progress will be even greater. It is declared that a continuance of trusteeship threatens private management of utilities and is obnoxious to the broad principles of businesslike administration which are associated with utility development in this country.

His is a point of view that it is not easy to dismiss. After all, belief in the policy of private development under commission regulation is general. There is little doubt that the administration of the Boston electric and bus transportation system under the act of 1918 has been unusually high-minded and public spirited; that without a radical increase in rates, and perhaps also without the use of the public credit, financial disaster would have overtaken the property. Fundamentally, of course, public management is open to objections of the gravest character from the standpoint of American institutions. One thing Mr. Wadsworth has done. He has made articulate the demand of those who seek the restoration of a program designed to give the fullest scope to private enterprise accompanied by the long-established safeguards of commission regulation in the field of public utility development.

Mercury-Arc Rectifier Gives a Good Account of Itself

DATA on operation of a mercury-arc rectifier installed on the Chicago, North Shore & Milwaukee Railroad have now been obtained over a period of several months. In general they indicate that in several respects this device is superior to the synchronous converter. The data, which were obtained by Caesar Antoniono, electrical engineer of the company, are included in an article by him appearing in this issue.

The advantages given by the author include high efficiency, simplicity of operation, low maintenance cost, reliability of service, high capacity to absorb momentary overloads, freedom from noise and vibration in operation, insensibility to short circuits and absence of synchronizing. The statements made in the article are based on actual experience over a period of five months of automatic operation following about a year while the station was operated manually. The conditions imposed on the rectifier were similar to those imposed on the five synchronous converters with which it has been compared.

The high efficiency obtained is particularly important in view of the low load factor. For the five synchronous converters the grand average efficiency was 73.4 per cent, while for the rectifier it was 81.7 per cent, a gain of 8.3 per cent. The author believes the comparison is fair, even though it was not exactly correct on account of exclusion of power consumed by the automatic devices.

More auxiliary devices are used with the rectifier than with the converter. Even so, the experience on the North Shore Line is that the rectifier is simpler to operate and has required less attention than the converters. Brushes, commutators and slip rings, which usually require attention, are absent, and the ventilation is simpler. No maintenance cost data are available for the installation, but it is the belief of the operators that this item will be less than for the converter. The only maintenance so far has been the regular weekly inspection and oiling.

As to reliability, Mr. Antoniono stated that the automatic rectifier station is as reliable as the average 60-cycle converter station of like capacity, or more so. This is supported by records of shut-downs over a period of

Digitized by Google

twelve months while the rectifier was attended and five months since it was made automatic. During this period the rectifier was out of service for trouble inherent to itself only 0.435 per cent of the total time. It is quite a commentary on reliability that failures of auxiliaries caused a loss of 0.674 per cent of the total time. Many of these, such as a chain break or a motor burnout, might have been avoided. Of course, the auxiliaries were neglected during the period of the test, for the operator's attention was directed principally to the rectifier itself. A study of the records obtained with a synchronous converter of similar rating indicates that the troubles with the rectifier itself probably will be less serious than those of a modern converter. Flashovers, which are likely to cause extensive repairs in the converter, are entirely absent.

It is significant to note that the author has great confidence in the converter. He predicts that it is here to stay and in ten or fifteen years will have a large use supplementing the converter. This prediction will bear watching by every power engineer.

Lighter Overhead Favored in Europe

BUILDERS of heavy current collection systems in the United States will find much to interest them in a study of light overhead, supporting structures and pantographs employing low pressures. The extensive use of light overhead in Europe, as described in an article appearing elsewhere in this issue, has been prompted by the many advantages the operators there find for it.

Lower original cost and lower maintenance cost effected by the lighter construction are the two main advantages held. Since from 25 to 35 per cent of the total cost of electrifying a railroad is in building the overhead system, any reduction in the cost of this important element would be a substantial saving.

Maintenance costs of both the overhead and the pantograph, at least under European conditions, has been found less with the use of a lighter system. The lower pressures necessary reduce the wear of the contact shoe materially. Likewise, the wear on the overhead conductors is reduced.

Use of an auxiliary bow on the pantograph to support the contact shoe is another European practice that has proved a success. The bow, being flexible and swinging through a short arc, easily follows minor irregularities of elevation in the contact wire. In turn, this permits the use of lower pressures in the main pantograph. In America the type of pantograph generally used has a heavy framework, with the collecting shoe hinged directly to it. Heavy pressure is essential, as the entire weight must follow even the slightest irregularities in order to maintain contact. Because of the high inertia of the heavy framework, where there is any irregularity in the contact wire the proponents of the European system believe that collection is not as uniform as with the lighter pantograph using an auxiliary bow.

With high pressures harder contact shoes are needed to prevent excessive wear, and in turn these hard shoes and the high pressures jointly cause excessive wear on the contact wire. Heavy pantographs also must have sturdy pin joints. If these are loosely fitted to reduce friction, there is side swaying and a consequent reduction in the effective width of the shoe. If they are tightly fitted, there is a considerable added load and reduced flexibility.

Even without auxiliary bows the lighter pantographs have proved more satisfactory in Europe than the heavy ones. The use of roller bearings makes the whole structure very flexible and permits good collection. Operators in Germany, Austria and Switzerland even find it unnecessary to use intermediate trolley wires to give flexibility. Just as the heavier overhead for the collection of high-voltage alternating current is favored in America, so is the lighter construction favored in Europe.

Novel Advertising Ways Attract Business

MANY years ago a railway manager said he did not see any reason for advertising street railway service. He considered that as street cars are very conspicuous objects on the street, they are their own best advertisements and need no other. This remark was made when the need of the utilities for publicity was not as well understood as at present. Now, with more competition than ever before, railways realize the necessity not only of advertising the advantages of car riding over other means of transit but also of explaining to the public at large some of the special problems of the electric railway business. Hence, notes on advertising campaigns which have gained results are worth while.

Such a campaign has been conducted for several years by the Birmingham, Ala., electric railway system, a feature of whose advertising is the extent to which it is carried on the cars themselves. Other mediums are used, of course, such as the daily papers, moving pictures, signboards and even, to some extent at least, direct solicitation. But the railway takes its own medicine by advertising extensively on the cars themselves. In the opinion of the company this is the most effective of all.

As explained in an article elsewhere in this issue, the spaces thus taken are not those which are utilized for the usual commercial car cards. In fact, the cards are in space which ordinarily would not be so used, such as the deck windows.

These window and dash signs might appear obtrusive if employed for commercial advertising. But when they are used to carry some good will or safety message or traffic announcement of the company no one can object. This plan also permits all of the usual spaces for commercial cards to be used for that purpose. It does not cut down the revenue of the company. It also separates the advertising done by the company from that done for its clients, the car card advertisers.

The practice of direct solicitation for car riding followed in Birmingham is even more rare. It is employed, of course, by the central station light and power companies, but is usually considered not worth while in railway work as the amount charged for a car ride is very small compared to that paid for an electrical installation. This objection may hold for regular solicitation. It does not apply where the business of an entire family can be won by a single call. With several members in the family, its carfares for a month might easily be greater than its electric light bill for the same period.

This is the warrant for a personal call in railway solicitation when a new line or service is begun. It is also sufficiently novel to attract attention. Strange, indeed would it be if the interest of the railway in the transportation business of the family visited did not result in comment favorable to the management.

Two-car express train approaching station on Jefferson Avenue surface rapid transit line in Detroit

Surface Rapid Transit Line

Operated in Detroit

Street cars on Jefferson Avenue give 18 m.p.h. service by running express with stops nearly mile apart. Local service provided with supplementary buses. All traffic on street expedited by elimination of frequent car stops

MORE than three months of experience with an experimental line on Jefferson Avenue, Detroit, indicates interesting possibilities in the idea of combination express and local transportation service with cars and buses on city streets as a means of providing rapid transit without the heavy investment required for subway or elevated line construction. The Detroit experiment is an attempt to increase the speed and efficiency of surface transportation on a heavy traffic artery by running street cars on an express schedule of more than 18 m.p.h., making only five stops in a distance of 4.15 miles. Buses handle the passenger traffic originating and terminating at intermediate street intersections. Free transfers between the two vehicles enable passengers to use the combined service of cars and buses from their point of origin to destination, much as they would use the express-local service on a four-track rapid transit line.

Jefferson Avenue in Detroit is a main traffic artery running in a north and east direction from the business district. It is approximately 7 miles in length from its downtown terminal to the outer end of the car line. The average width of the street in the express zone is about 90 ft. from curb to curb. Repair work and other obstructions, however, narrow this pavement in some sections to 60 ft. Prior to the introduction of the present express service, the cars running on Jefferson Avenue made about six stops to the mile outside the business district. The average schedule speed on the line was less than 12 m.p.h.

Speed Over 18 M.P.H.

Express operation commenced on Sept. 18 with the inauguration of a schedule which calls for an average speed of 18.4 m.p.h. in the express zone. Beginning at the city's limit, the end of the line, the street cars are operated on a local schedule for the first 1.89 miles, with actual stops averaging about three blocks apart. Inbound toward the business district the express zone following this local section is 4.15 miles long and is covered by the cars in 13½ minutes. The former running time for this section of the line was 20½ minutes. The remaining 0.7 miles of the one-way mileage is half of a loop in the downtown congested section and requires about seven minutes running time on the base schedule.

Car stops in the express area are spaced from 0.53 miles to 1.16 miles apart. This gives five runs with an average length of run of about 0.83 miles between express stops. The express zone speed of more than 18 m.p.h. is maintained easily even during the rush hours of the day. The average all-day speed for the entire line, including the local running beyond the express zone and in the congested business district, is approximately 14 m.p.h. This is being accomplished with two-car, motor-

trailer trains, using old equipment not designed for this class of service. The time saved by the introduction of the express service is between seven and eight minutes for the trip each way.

Jefferson Avenue is treated as a preferred traffic street. At the present time traffic signals at intersections are operated by hand. The signal for cross traffic is given just as a train comes into an express stop, and the clear signal is thrown when the train is ready to proceed. At intermediate intersections, between express stations, the crossing signals are operated so as to permit the express trains to move through without interruption. Experience has shown that this plan, while seeming to favor the movement of cars without regard to other traffic, actually expedites the movement of all traffic on the street. It is recognized, of course, that the plan of operating signals by hand is merely temporary, and studies are now being made to determine the best system of automatic signals for use with this express operation. It is probable that a "wave-control" system will be ultimately installed.

Buses Give Local Service

Dodge-Graham 21-passenger buses give a local service on the same street with the car line between the downtown business district and the last outbound express stop at Lillibridge Street. This makes the outer terminus of the local bus line approximately 1.8 miles from the extreme end of the car line, as shown on the accompanying map of the route. The local buses pick up passengers between express stops, or carry them to local stops after they have transferred from express cars.

Experience on the line gives several interesting facts regarding the preferences and riding characteristics of the passengers carried. Approximately 10 per cent of the total car passengers use the combined service. This indicates, therefore, that the number of buses required to provide the supplemental local service is only a small proportion of the number required if all car passengers transferred to a bus to reach their destination. Approximately 50 per cent of the total passengers picked up by the local buses transfer to the express cars. The other 50 per cent of those carried by the buses either originate so close to the business district that they complete their journey on the local bus without bothering to transfer to the express cars, or both their origin and destination points are at local stops and the time saving offered by the express cars is not sufficient to offset the inconvenience of transferring from bus to car and from car back to bus.

Passenger volume on the Jefferson Avenue line on Monday, the peak day of the week, checked over a period of seven weeks, is approximately 37,200 revenue passengers per day. This gives an approximate idea of the density of the line. The base car service is supplied with fifteen single cars operating on four-minute headway. Running time in the base from the end of the line to the downtown terminal is 30 minutes inbound and 28 minutes outbound, with a two-minute layover. During the rush hours express service is provided with two-car trains operating on two-minute headways. Twenty-seven such two-car units are operated during the rush period. The express service is given between 5 a.m. and 9 p.m. Outside of these hours the coaches are taken off and the entire service on the street is supplied with street cars, making all local stops.

Makes Large Reduction in Cars Required

In comparison with the former local service on this line before the express experiment was started six trains have been taken off in the rush hours and four cars less are operated during the base period, to give the same headway as was formerly provided. The supplementary local bus service, during the period of express operation,

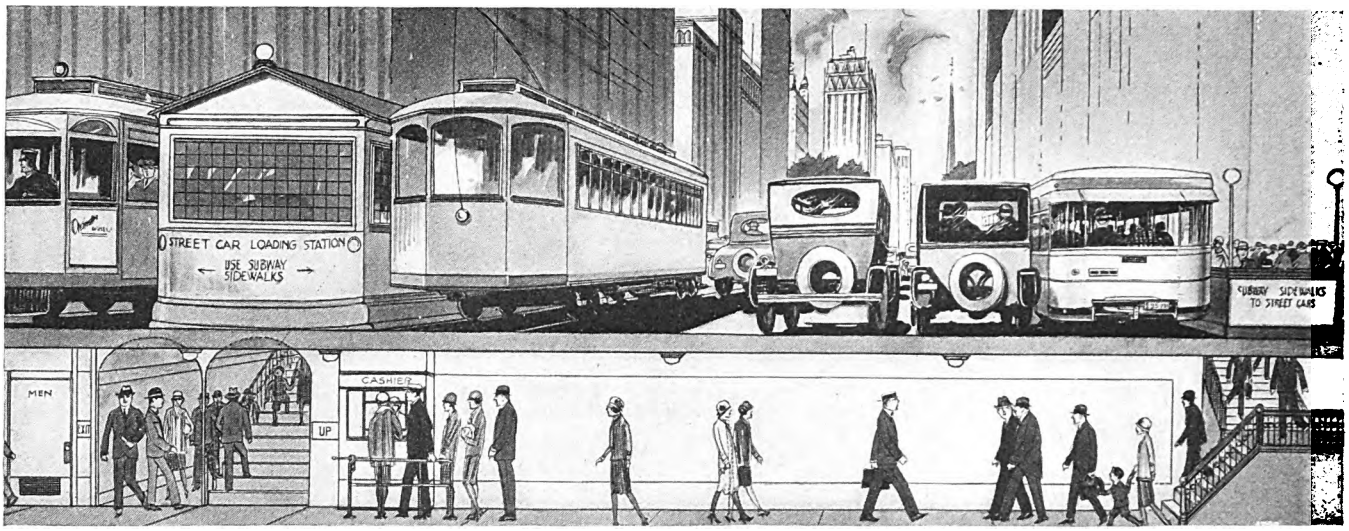
Digitized by Google



Sketch showing proposed arrangement of street for Miller-Schorn plan, with center loading platforms and sub-surface cross passages

is given with 34 21-passenger Dodge-Graham buses. These buses operate from the outer express terminal and loop down through the congested business district, as shown on the accompanying map of the route. The average schedule speed on the local buses is approximately 9.94 m.p.h. A total of 3,204 coach-miles per day, or 388 coach-hours per day, are operated to provide the supplementary local service.

Protected Safety Zones at Express Stops

Safety zones at the express stops are of the type previously standard in Detroit, using protecting pipe railings. The zones are 88 ft. long, with upright stanchions erected 6½ ft. from the track and spaced about 8 ft. apart. To afford shelter for passengers transferring between local buses and express cars, canvas awnings over the safety zones and splash guards around the sides have been erected.

Local buses pick up and discharge passengers at the curb. When arriving at an express stop, these buses run inside the safety zone either ahead or behind an express train, so as to avoid the necessity for transfer passengers to cross the traffic stream on foot between the curb and the loading platform. This arrangement was adopted temporarily as a means of trying out the express scheme without undertaking costly construction work to provide more permanent loading facilities at express stops. If the plan is ultimately declared entirely successful, adoption of the Miller-Schorn arrangement of express loading stations between the tracks in the middle of the street connected to the curb with pedestrian under-passes is contemplated. This, it is claimed, would take up less street area than the present outside loading platforms on each side of the double-track line, but would require cars to be arranged for left-hand loading. If the Miller-Schorn plan is adopted, local buses would then discharge and pick up passengers at the curb line at express stations just as they do at local stops, the transfer to the loading platforms being made through pedestrian under-passes, as illustrated in an accompanying cross-section sketch of the proposed arrangement.

Unfortunately, for purposes of analysis, a number of variable and special conditions on the Jefferson Avenue line make it impossible to determine from study of the present service the feasibility of this express-local scheme for use on other heavy traffic streets in Detroit or other cities. Before the express plan was put into operation the Jefferson Avenue line was part of a through route extending through the business district and out on Grand River Avenue, northwest from the center of the city. Simultaneously with the inauguration of the new service, the through route was cut in the business district, and through passengers are required to transfer at that point. This made a considerable difference in the travel habits on the line, and as a result it is almost impossible to get a direct comparison of costs and riding, to determine comparative operating costs and revenues in relation to

Digitized by Google

the old service. A further complication is produced by the fact that the Department of Street Railways formerly operated on Jefferson Avenue a double-deck 10-cent bus service, which has now been replaced with the small single-deck buses providing the local service for the express line and carrying passengers at 6 cents, the regular car fare, with transfers to and from the express cars.

Independent Buses and Jitneys Compete With Line

Two independent competing transportation services are also operating on Jefferson Avenue. Double-deck buses of the Detroit Motor Bus Company on this street give a 10-cent service similar to that formerly provided by the Department of Street Railways. In addition, the street is infested with jitneys operated by private individuals. The combination of these two competitive services hopelessly complicates the problem of determining just how much the faster car service may be expected to attract automobile owners to use the lines in preference to their personal cars.

During the experimental period normal traffic conditions have been considerably disturbed by extensive repair work on the street. Furthermore, the car equipment used for express operation includes some of the older equipment owned by the Department of Street Railways. Two-car trains consist of motor cars and trailers. This equipment does not develop the full possibilities of this service from the standpoint of speed, frequency or attractiveness to passengers.

Still another special condition, the nature and location of Jefferson Avenue as a traffic artery, interposes a difficulty in determining the feasibility of the express idea on typical surface trunk line streets. This street adjoins and parallels the Detroit River throughout the greater portion of the express zone. Very few intersecting streets cut through to the river and the problem of cross traffic is thereby largely eliminated.

Offers Attractive Possibilities for Faster Transportation

Despite the several special conditions found on this line, which make the Detroit experiment far from conclusive, and which also make it difficult to determine the possibility of applying this express-local idea to other heavy traffic arteries either in Detroit or other cities, the idea seems to offer attractive possibilities. To obtain full advantage of the express-local system in the way of expediting service, a system of subway dips in the heart of the business district is considered a logical ultimate step.

One of the principal difficulties which attended the inauguration of the new service was the handling of crowds from several factories along the line. This situation was met by placing a number of "stand-by" buses at strategic points along the line to be used for the accommodation of these industrial employees during the peak period.

When the service was inaugurated guards were stationed at all of the express stops to expedite the interchange of passengers to and from the express and local units and to explain the details of the plan. Men in scout cars patrolled the express area to inform passengers of the boarding points for the new service. A number of the station guards are still retained during the rush hours.

Service Popular With Public

On the whole, the service has proved popular with the riding public The operation is at present carried on with little confusion. Comment by the press and the public has recognized the experimental nature of the present installation and has, on the whole, been quite favorable. There has been a notable reduction in traffic congestion on Jefferson Avenue resulting from the elimination of car stops. Although the total volume of vehicular traffic has increased considerably due to the speed with which the traffic stream moves on this street, there is little congestion, due to the fact that the express cars move along at the same rate as other traffic.

Canvas awnings furnish protection for waiting passengers at express stops

Signal Experiments Being Conducted on Street

In an effort to work out a plan of signal control which will avoid interference with the movement of express cars, while at the same time eliminating hand operation of crossing signals, experiments are being conducted with an automatic signal at Burns Street, in which the customary time-controlled signal is wired to a trolley contactor so that it will be thrown to clear the express line on the approach of a train and will return to automatic time-controlled operation when the train has passed the crossing. The conditions obtaining on the Jefferson Avenue line, however, are special, as it has comparatively little cross traffic. For this reason it will be difficult to determine the applicability of any control scheme adopted here to lines on other thoroughfares having heavy cross traffic.

One tendency which has been observed as a result of the expedited car service is that of passengers who drive private automobiles to express stops and leave them parked near by while they continue their journey to the business district by street car.

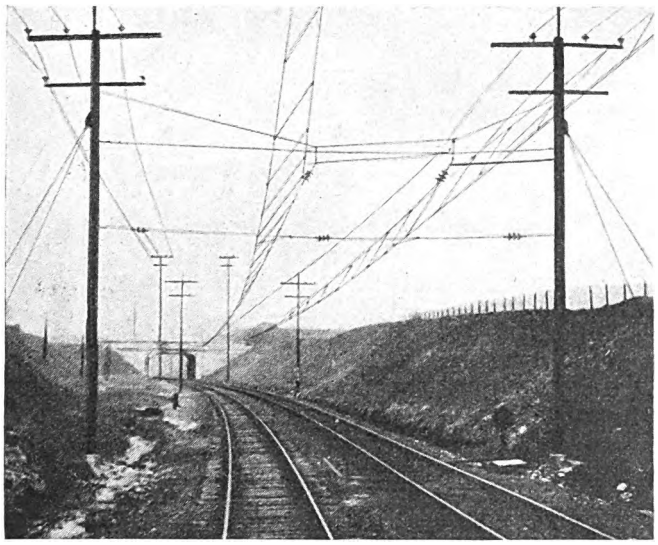
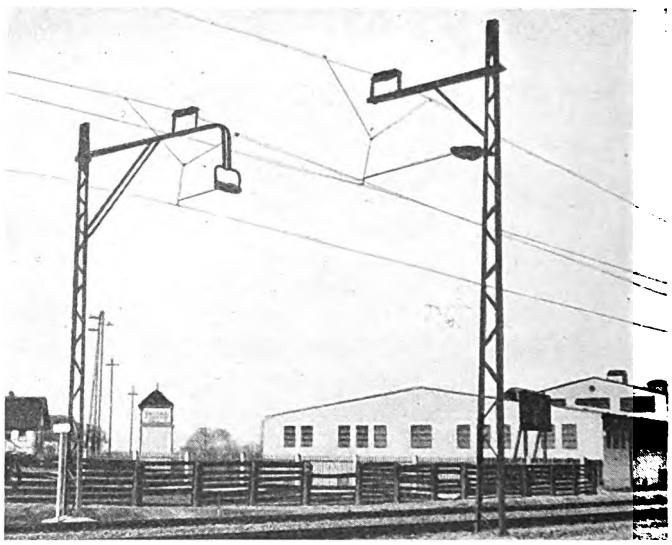
Light Construction
Features European Overhead

By use of pantographs of light weight and low inertia with hinged shoes a much cheaper type of overhead and supporting structures is used than is practicable with heavy pantographs

By Kent T. Healy
Consulting Engineer, Natick, Mass.



Two-track main line catenary and supports on the New York Connecting Railroad



Old style insulators are used on this German overhead system

CATENARY and pantographs in use on the various high-voltage alternating-current railroad electrifications of the world are of two very distinct types. These differ not only in the design but also in the cost of construction and maintenance. The first uses a heavy pantograph requiring a high pressure on the contact wire with resulting heavy catenary construction and heavy structures to support the overhead. The second type employs a light pantograph with an arrangement to give the contact shoe low inertia so the pressure against the contact wire will not have to be very heavy. This permits the use of a light flexible catenary system and lighter supporting structures.

The high-pressure pantograph design for high-voltage alternating-current distribution is found alone in America. Usually the pantograph for this system has a pipe frame with two pieces for each lower leg, a single upper leg and side cross braces for the upper section. Until recently all the joints were of the pin type, but now roller bearings have been introduced at the base joints. The sliding shoe is an integral part of the structure so that any movement of the shoe to follow irregularities in the elevation of the contact system causes a corresponding movement of the whole pantograph structure. This gives the contact shoe a high effective inertia and makes it slow to follow trolley irregularities unless the pressure pushing it up is high. The high pressures demand a hard shoe to prevent excessive shoe wear, but this causes considerable wear on the contact wire. The pin type of joint requires a certain amount of play to keep the friction down and side swaying of the pantograph results. This, in turn, reduces the effective width of the contact shoe for safe use and necessitates accurate alignment of the catenary or else more trouble from the pantograph leaving the contact system will result. The pin joint is inefficient and the resulting friction may add as much as 6 lb. to the pressure of the raising springs.

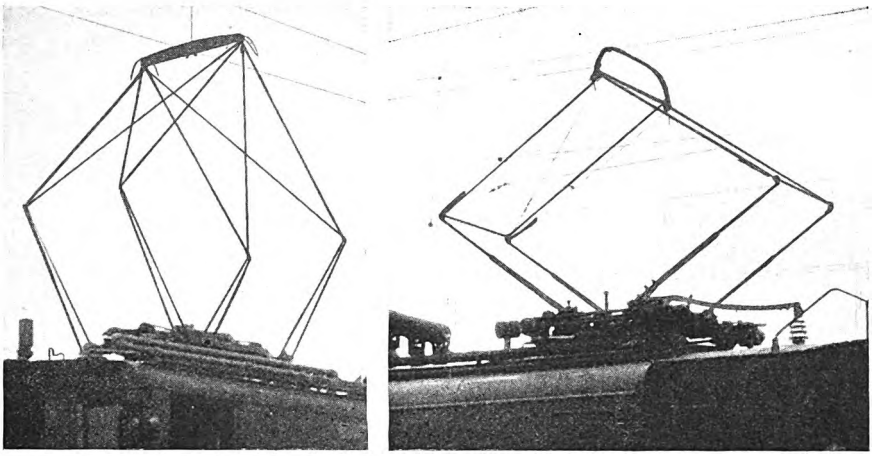
Lighter Pantographs Have Independent Shoe Supports

A much lighter pantograph is used on the European high-voltage alternating-current electrifications. Both its lower and upper legs are made of pipe with a cross bracing either of wire or pipe. A feature of the European type is the independent support for the contact shoe. This support is in the shape of a bow and extends approximately 1 ft. above the main body of the pantograph. It is free to rotate about the axis of the upper cross rod and normally is held in a vertical position by small springs. When in motion, mechanical resistance against the trolley tends to make the shoe move about its axis so that the bow is not vertical, but on a slant. In this

Digitized by Google

position any minor irregularity in the height of the trolley is taken up by the rotation of the shoe and its bow about the axis. The resulting inertia is almost negligible as far as movements are concerned, since the inertia is dependent only on the weight of the bow and shoe and the resistance of a single joint. Consequently, constant contact with the trolley at high speed can be maintained without sparking. Also, a high pressure to overcome the high inertia of the whole pantograph in following small changes in trolley height is not required.

Wear on the trolley with the lower pantograph pressure is negligible and trolley renewals are infrequent. Larger variations in trolley height are taken care of, as usual, with the main body of the pantograph, in which movement is made freer by use of roller bearings and lighter weight.

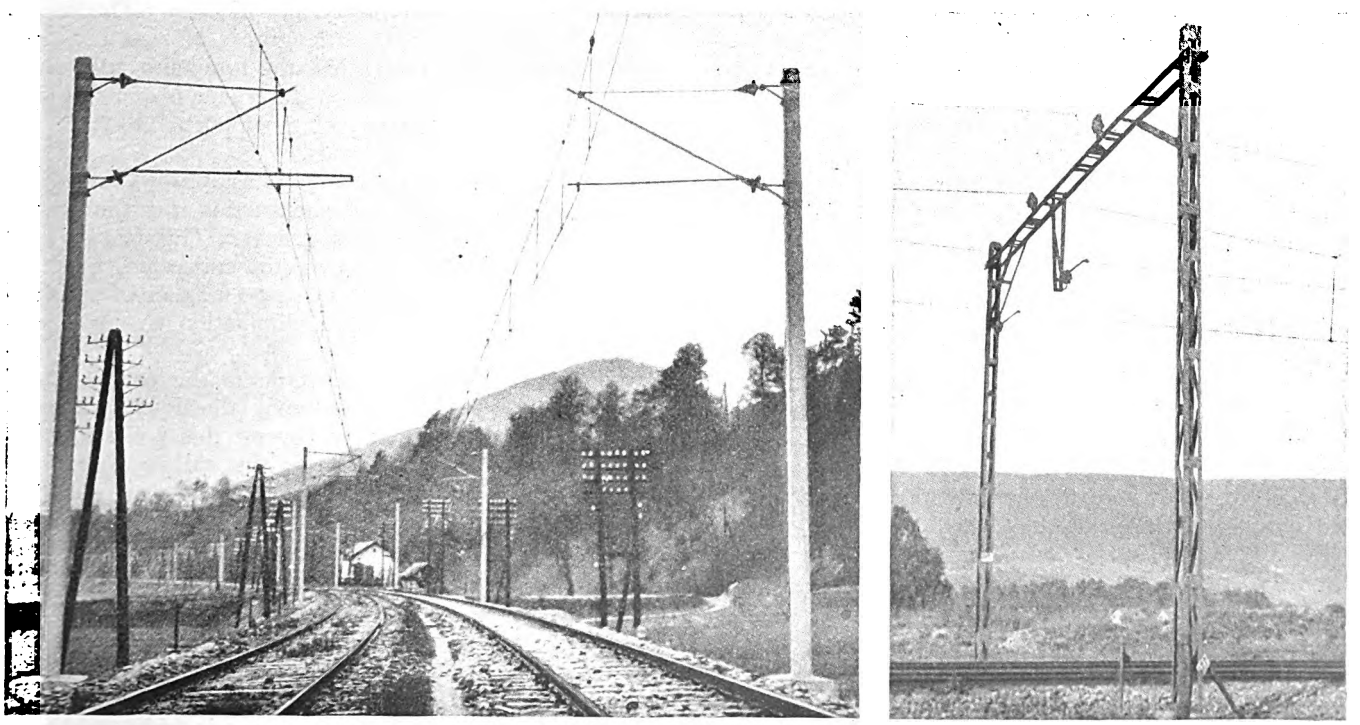


At left, high-pressure pantographs of this type are in use in America. At right, a typical European high-voltage pantograph with low pressure on the trolley. Note the bow supporting the contact shoe

Operators in Switzerland have succeeded in collecting 180 amp. at 55 m.p.h. with one aluminum shoe and without sparking. At 27 m.p.h. they have collected 250 amp. The contact pressures vary between 6 and 9 lb. Tests have shown that using two pantographs not only insures sparkless collection but also that the life of the shoes is nearly doubled. With a single shoe the life is about 3,100 miles and with a double shoe 5,600 miles on an average. This indicates that the reduced current density and sparking decrease the wear on the shoe and the contact wire as well. In Switzerland the wear on the trolley wire has been found to be negligible. This experience seems to be typical of all the other systems of this type in Germany, Austria and Sweden.

The main advantage in the use of lighter pantograph pressure is not that of decreasing wear on the contact line and shoe, but the reduction in weight of the entire overhead system. Because the distribution system may cost from 25 per cent to 35 per cent of the total cost of the electrification, the reduction effected by using lighter overhead is substantial. Designers of the high-pressure pantograph system are tending to make the catenary heavier with the addition of intermediate trolley wires, demanding larger supporting stretches. Additional wires may be needed for a direct-current overhead system, but not for a normal high-voltage alternating-current system. Designers of the low-pressure pantograph system are abandoning the complex forms of catenary and adopting simple, flexible suspension with a messenger and a single contact wire. Operators in Germany, Austria and Switzerland have tried an intermediate trolley wire to give flexibility and have decided that it is unnecessary with their type of collecting apparatus. In Sweden also the simpler types of catenary are used. Detailed characteristics of the design described are shown in the accompanying table.

Other characteristics of the lighter catenary design are of interest. All contact wires are given a zigzag



At left, standard catenary construction on an Austrian main line. The steel I-beam supports are set in concrete. At right, simplicity and sturdiness characterize this Swiss overhead

alignment from pole to pole instead of being in a straight line, to distribute the wear on the pantograph. This requires a steady brace at each pole. Since these are also necessary for wind bracing in tangent sections no additional expense is involved. The effect of wind forces has been considered more by European operators and it is the determining factor in the spacing of poles for horizontal support in tangent sections. For instance, the Germans in determining the general standards for catenary construction on all their lines determined the maximum distance between supports to be about 250 ft. for a wind velocity of 69 m.p.h. and an allowable variation of 2¼ ft. from the center line of the track. In curved sections the tangent construction is continued as a series of chords within the limits of the alignment used for the zigzag arrangement, which varies from 17 to 24 in. In both Switzerland and Germany some longer spans of 330 ft. and 480 ft. are in use with intermediate horizontal bracing poles.

Pico Street Viaduct Dedicated

DEDICATED with fitting ceremonies last month, the new 1,007-ft. Pico Street viaduct in Los Angeles, Cal., erected at a cost of $306,000, embodies the latest engineering developments and does away with a hazardous grade crossing. The event, sponsored by the city, the county and the Pacific Electric Railway, was presided over by Vice-President and General Manager D. W. Pontius. Brief addresses were made by Mayor Cryer, County Supervisor Graves and David R. Faries, chairman Los Angeles County grade crossing committee. Mr. Pontius introduced the speakers, gave a brief history of the project and cited facts and figures in connection with the structure.

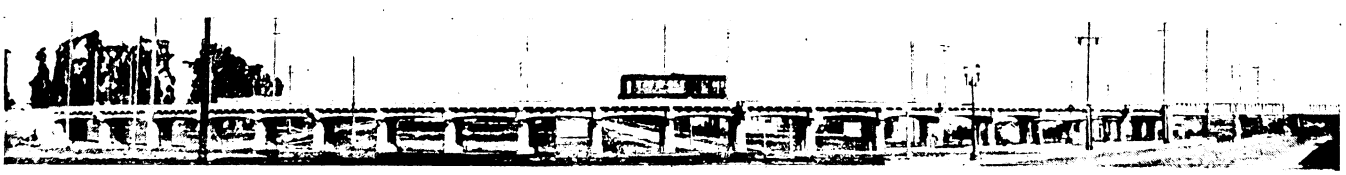
The Mayor called attention to the speed of erection, the massive girders and concrete piers having been placed so expeditiously that traffic on Pico Boulevard was delayed less than eight hours. The Mayor, Messrs. McClellan and Faries then participated in the ceremony of driving three golden spikes at the point where the final work marking the official completion of the structure was staged, after which the large number of persons who had witnessed the exercises were conducted on a tour of inspection under the structure. To demonstrate the lack of noise and absence of rumbling, a train traveling at high speed was operated over the viaduct with the visitors immediately below the structure. It was generally conceded that less noise developed than that which arises from a train passing over the surface streets.

The Pico Street project just completed is the outgrowth of the activities of the Los Angeles County grade crossing committee, organized in 1923 to make a comprehensive study of the problem in southern California. The committee is composed of city, county, state and railway representatives. The Pico crossing was found to need relief most quickly, owing to the tremendous amount of vehicular traffic and a daily average of 123 trains of the Pacific Electric Railway across Pico Street.

Originally intended to separate traffic only at Pico Street, the plans were broadened so as to extend the structure over both Tremaine and Longwood Avenues. Involving an expenditure of $306,000, the Pico Street structure is 1,007 ft. in length, being the longest by several hundred feet of any of the 65 grade separations now located on the lines of the Pacific Electric. The section over Pico Street, 291 ft. in length, is of steel construction, so designed as to utilize the minimum amount of road space. The approach on either side is of reinforced concrete, the entire unit being supported by concrete piers spaced at 32-ft. intervals.

The noise reduction has been accomplished largely by the use of mass concrete construction for the trough decks supporting the railway tracks. This feature permits standard rock ballast over the entire length of the viaduct. The massiveness and large number of supporting piers also contribute to elimination of noise and rumbling.

The expense of this project up to the north side of Pico Street was borne jointly by the Pacific Electric Railway and the city, while beyond this point the cost was shared one-third each by the railway, city and county. Work was started on May 27 last and was completed within six months.



The new Pico Street viaduct in Los Angeles eliminates a hazardous grade crossing

Installation of the 1,000-kw. mercury-arc rectifier set consisting of two six-anode, 600-volt tanks

Rectifier Superior to Converters

on North Shore Line

Operating results of mercury-arc rectifier show higher efficiency, simpler operation, less maintenance cost and other advantages. Five months actual figures indicate that reliability in service has been attained

By Caesar Antoniono

Electrical Engineer Chicago, North Shore & Milwaukee Railroad

Mercury-arc rectifiers in America have been perfected along lines similar to those followed in Europe. The present article, which is abstracted from a paper presented at the regional meeting of the Great Lakes Section, American Institute of Electrical Engineers, held at Chicago, Ill., Nov. 28-30, 1927, is of particular interest as giving details of operating results with rectifiers over an extended period.—EDITOR.

DEVELOPMENT of the mercury-arc rectifier in this country in commercial form is very much in its infancy. It appears to be used more extensively in Europe, and the extent to which it will be applied here is limited only by the economical and operating results which can be obtained.

In considering its adoption to any property we naturally compare it with the synchronous converter and motor-generator set designed to serve the same class of service, with which we are familiar. The advantages of the mercury-arc rectifier over the synchronous converter and motor-generator, according to previous articles, are: (1) High efficiency over the whole working range; (2) very high capacity to absorb momentary loads; (3) insensibility to short circuits; (4) no synchronizing; (5) simple operation and minimum attention; (6) noiseless operation and no vibration; (7) low maintenance cost; (8) reliability of service.

This article discusses each of these points in connection with the experience we have had with the operation of a rectifier on the Chicago, North Shore & Milwaukee Railroad. The rectifier is rated at 1,000 kw., 600 volts direct current and is located on the section of the road as shown in an accompanying diagram. This section is fed also by synchronous converters of 1,000-kw. and 1,500-kw. rating, as shown. The rectifier, made by the

Digitized by Google

General Electric Company, is said to be the first 600-volt machine made in this country which has been installed in actual service.

The efficiency of the rectifier was compared with that of five converter installations by taking measurements on each substation for five months. The results are shown in Table I. The efficiency is taken as the d.c. output divided by the a.c. input. The figures include the efficiency of power transformers and converter or rectifier. They do not include the power used for the operation of automatic devices in auxiliaries such as vacuum pump, motor-generator set, heaters in the rectifier station, nor the power used by auxiliaries and a.c. contactors in the converter stations. I believe this comparison is fair. Although not exactly correct, it shows a pronounced difference in the efficiencies of the two types of equipment under nearly similar load conditions and very low load factor.

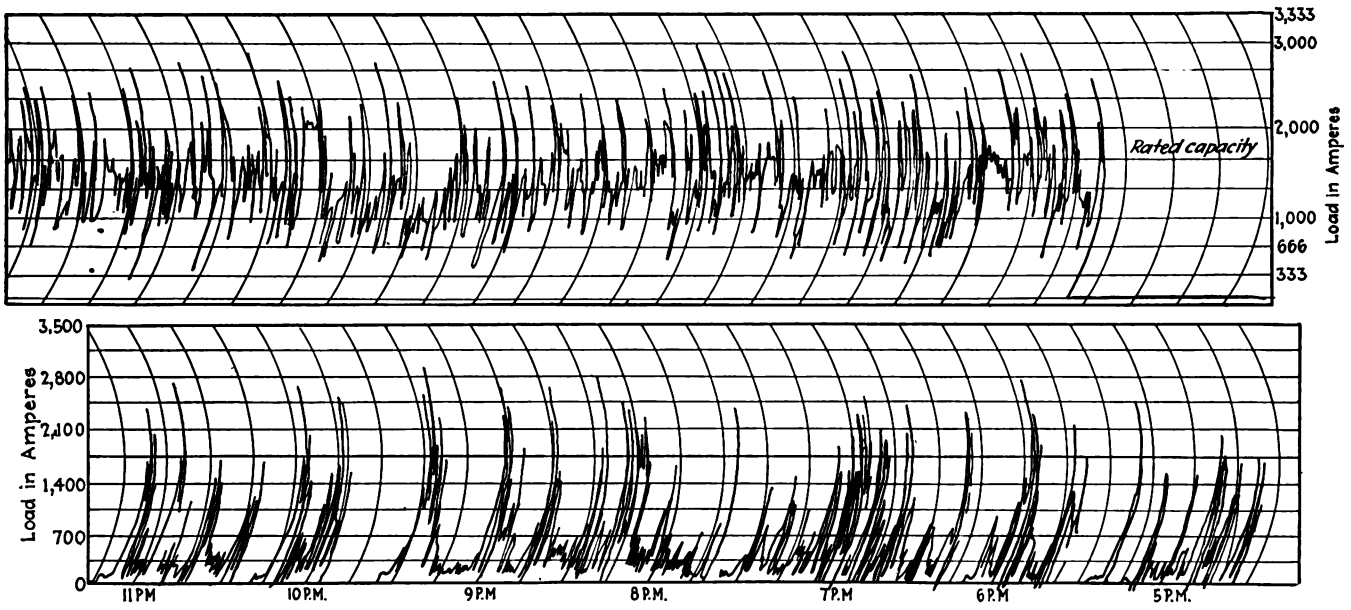
The ability of the rectifier to carry high momentary overloads is seen from the graphic ammeter chart showing current delivered on a day of extremely heavy load. The chart was taken twelve hours after the unit was put in operation. It shows load peaks much above the rating of the rectifier. There were no signs of its being overloaded, and an occasional opening of the high-speed circuit breaker, which would reclose immediately, was the only trouble experienced in carrying this load. The other graphic ammeter chart shows a typical load on the station. There are many very high load demands of short duration, some of them well above the rated capacity of the rectifier.

On sustained overloads we are not in position to give much information. Usually the load demand above the rectifier rating is of short duration, but there are unusual conditions on the railroad when a load of 175 or 185 per cent of the substation capacity may be carried by any of these stations. The duration of this load is controlled by thermostats on the load-limiting resistors set to release this load in about six or seven minutes.

It is, however, possible to have a load above the rating of the equipment and below the 175 per cent overload relay, setting for a much longer time than seven minutes. A load of this kind would be without thermostatic control and might last indefinitely. It could be caused by traffic schedule disarrangement on account of trouble, extra passenger or freight service or a trolley wire on the ground at such a distance that the resistance of the feeders would limit the current.

Happenings of this nature are not unusual on a railroad, and I believe that we have more than one time imposed on the rectifier an overload of much longer duration than we know. There are no recording instruments to show when this occurs. The rectifier does not show any signs of having been abused; momentary opening of the high-speed circuit breakers is the only indication that there must have been excessive load.

Our experience shows that the rectifier is not sensitive to short circuits. Repeated reclosing on a short circuit does not affect the rectifier. Under the same treatment a synchronous converter of the same capacity would be likely to flash over regardless of the protective devices, and in an automatic substation it would lock itself up and the station would be shut down until an inspector could put it back in service.



Above—Current delivered by mercury-arc rectifier on day of extremely heavy load
Below—Another graphic ammeter chart showing typical load on the rectifier substation

Operation Is Simple; No Synchronizing Necessary

The fact that synchronizing is not necessary with the rectifier is quite important. In the automatic substations on our system only four to six seconds is required to connect a rectifier to the line. From 20 to 35 seconds is required to put a converter on the line. Therefore, we can deliver a higher voltage to the train and trolley 16 to 29 seconds sooner with a rectifier.

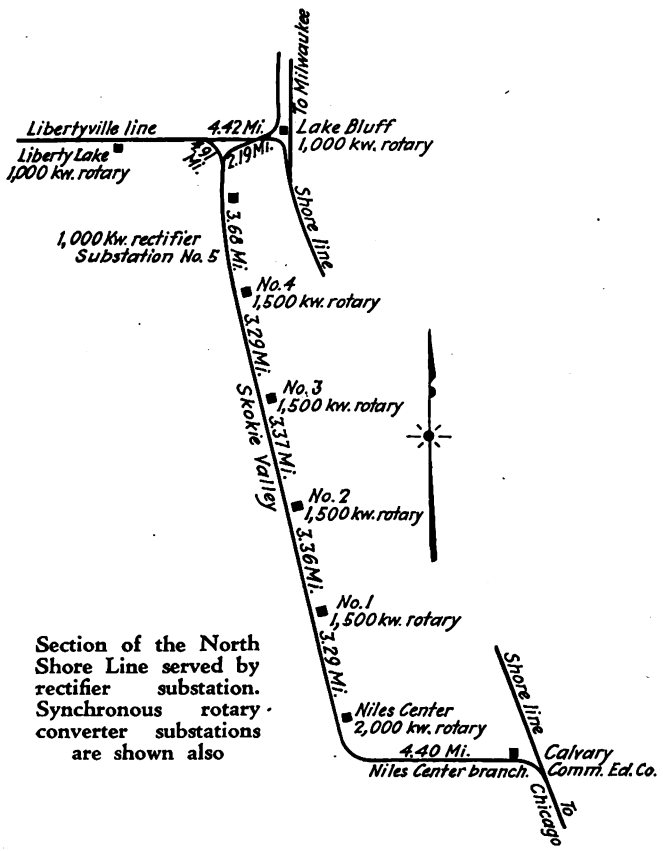
We must agree that the mercury-arc rectifier requires less attention than the synchronous converter and its operation is much simpler. There are no brushes, commutator and slip rings to take care of. There is no dust spreading over the equipment. This advantage is very much appreciated in automatic stations without attendants. The ventilation of the equipment and buildings is also simplified as compared with converters, especially in unattended stations.

I do not want to create the impression that there are

Digitized by Google

less devices involved in the mercury-arc rectifier than there are in the converter station. On the contrary, with the rectifier more auxiliaries are used, such as arc-starting exciters, vacuum pump, water supply, temperature regulators, tank heaters, etc. While with us some of these devices have caused a large number of shutdowns, the troubles were in the individual pieces of apparatus and they have been corrected. Those devices should not require much attention.

The absence of vibration and noise in the mercury-arc equipment makes it possible to install it in locations where the synchronous converter would not be allowed. In one converter installation it cost about $8,000 for soundproofing and ventilating the substation building, eliminating the noise to comply with the wishes of the surrounding residents. Such expense would not have been necessary with mercury-arc equipment. Incidentally, in addition to the first cost we have added ventilating equipment and extra building maintenance. Obviously with the absence of vibration it is not necessary to install special foundations for the rectifier; it may be set on an ordinary floor. Ventilation becomes of minor or no importance, and in general a less expensive building is required.



Section of the North Shore Line served by rectifier substation. Synchronous rotary converter substations are shown also

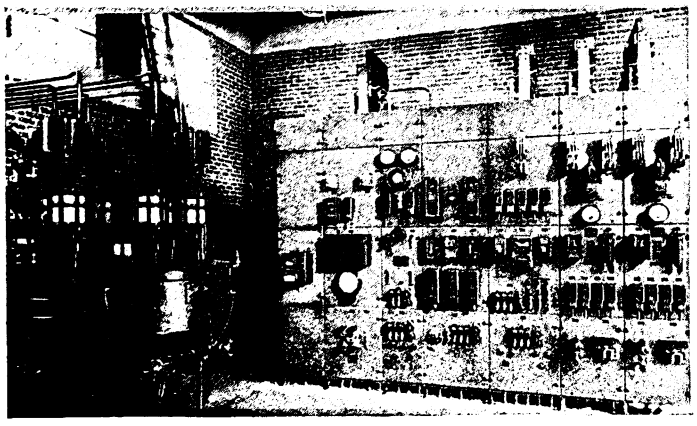
Reliability and Lower Maintenance Costs Important Considerations

We do not know at this time just what maintenance will be necessary on the rectifier. From May, 1926, to May, 1927, this station was attended by an operator and the manufacturers of the rectifiers kept a close watch on its performance. Being in a development or trial stage, they took care of necessary maintenance. In addition, new developments which they made in other installations were applicable to this equipment and minor changes were made accordingly. Since May of this year this equipment has been in automatic operation without an operator. The maintenance required is very little; outside of the regular weekly inspections it has amounted only to supplying a little oil. Like others, we are watching this item with a great deal of interest. Our impression is that the maintenance will be very much less than that required for a converter.

The automatic rectifier station is as reliable as the average 60-cycle synchronous converter station of the same capacity, if not more so.

The record for this rectifier substation commencing with May, 1926, when it was first put in service, all through a trial and adjusting stage until May, 1927, when it was made automatic, is given in Table II. Commenting on the data in this table it is of interest to note that the time the rectifier was out of service on account of trouble with the rectifier itself was 0.435 per cent of the total time. The time lost on account of the auxiliary failures was 0.674 per cent of the total time.

The nature of the trouble with the auxiliaries is rather interesting. It would be expected to have a larger amount of trouble with the rectifier on account of its newness in the field, but to have a small motor-generator set or a chain on a water pump and motor cause this bad record is out of place in our days. Engineers have been building and operating motor-generator sets and water pumps for years, but in this case we were after the big things and let the little things cause the most trouble. Fundamentally the record is good; the nature of the troubles is not serious. The record as an automatic substation, since May, 1927, is given in Table III.



The rectifier and complete automatic switchboard, including high-speed circuit breakers in positive and negative machine circuits and feeders

Average kilowatt-hours per hour	167.4	131	191.5	209.2	166	181.4
Grand average, efficiency, per cent			73.4			81.7

Of all these shut-downs, the five lock-outs after the third closure of the oil switch could be questioned and possibly may have been caused by arc-back in the rectifier, or by other troubles in the control which we have not detected. None of the remaining troubles were inherent with the rectifier, but were caused by auxiliary devices.

Our confidence in its reliability is such that we have established a weekly inspection for this rectifier station, but we do not consider it advisable at present to leave a converter so long without inspection.

Rectifier Compared With Synchronous Converter of Same Capacity

The record of the rectifier was compared with that of a synchronous converter of modern design and of the same capacity. This converter is located on another section of the railroad where the load conditions are about the same. It is protected from excessive loads by load-limiting resistors without high-speed circuit breakers. In this comparison I did not use any of the converters shown in the accompanying illustration, because these converters are of larger capacity than the rectifier and naturally they are more stable and would take a larger shock and carry more load without flashing over. Neither have I used the converter at Liberty Lake, as the mo-

TABLE II—RECORD OF SHUT-DOWNS OF RECTIFIER FROM MAY, 1926, TO MAY, 1927

Cause of Shut-down	No.	Total Time Minutes
High temperature of tanks	2	48
Exciter trouble	39	536
Driving chain and motor on water pump	13	315
Loose connection and bad control circuit	3	50
Vacuum-pump trouble, motor and oil pump	3	260
Flashover of anodes	6	819
Starting anodes sticking	5	602
Miscellaneous unknown	12	1,109
Total shut-downs	83	3,739

Total time rectifier operated 337,140 minutes.

Shut-down by failure of	No. of Times	Average Time Minutes	Per cent of Time of Operation
Rectifier	25	58	0.435
Auxiliaries	58	39	0.674
All	83	45	1.109

mentary load demands on this station are less than they are on the rectifier.

The converter which I compared had 45,434 hours of run on its record on May, 1927, and had 34 flashovers causing as many shut-downs, representing 276 hours out of service on account of flashovers. There was an average of 8.1 hours out of service per shut-down, as the majority of these flashovers damaged commutator flash barriers, brushes, brush rigging and the insulation in other parts of the machine.

Since May, 1927, to date, this same converter flashed over eight times, and due to the many flashovers which this machine has had extensive repairs had to be made on the commutator, rings and other insulation involving 150 hours in one shut-down. This record seems to indicate that the troubles with the rectifier itself probably will not be as serious as with the converter of the same capacity under similar load conditions.

The writer has great confidence that the mercury-arc rectifier is here to stay and predicts in ten or fifteen

TABLE III—RECORD OF FAILURES SINCE MAY, 1927, WHEN SUBSTATION WAS MADE AUTOMATIC

Failure in auxiliary	No. of Shut-downs
Motor on one vacuum-pump burned out	1
Locked out after third reclosing of the oil circuit breaker within a definite time during storms	3
Locked out on account of broken spring on oil-switch mechanical latch	3
Locked out after third reclosing of the oil circuit breaker within a definite time, cause unknown	5
Fuse blown on operating transformer supplying power for the operation of devices	1
Total shut-downs	13

years from now a large application supplementing the converter. The converter had its days, the rectifier's days are coming. It is true that the rectifier at present costs more than a converter of the same capacity and there is some misunderstanding as to its rating. But with an increasing number of installations and our co-operation as operators with the manufacturers the development process will be speeded up and the production cost will naturally be reduced to a figure comparable with that of the converter.

Birmingham Believes in
Advertising Its Service

Coffin brief of Alabama company shows that it uses a great variety of means for bringing the merits of car riding to the attention of its public

EXTENSIVE advertising of its railway and electric light and power service is believed in by the Birmingham Electric Company, Birmingham, Ala., as a paying proposition. It uses all the recognized mediums, such as newspapers, billboards, car cards and the backs of its electric light bills. A typical message appearing on a lightbill one month was as follows:

"Let the street cars pay your gas and electric bills. By using the street car instead of your automobile in going to and from town every day you will save enough each month to more than pay your gas and electric bills."

In using the inside of its cars the company not only "takes its own medicine," but says in its brief for the 1927 Coffin Prize: "In our opinion, this is the most effective advertising that our company has used."

The inside car advertising is not in the usual position of a car card, but in signs 8x30 in., fitting into metal frames, which are fastened in the deck windows, so the signs can be seen from both the inside and the outside. There are seven of these signs on each side of the car. Viewed from the outside, each window contains one word, or perhaps two short words, the seven signs forming a sentence. On the reverse side of each of these cards is other wording which is visible to passengers inside the car.

These inside signs are illustrated in colors and each contains a separate sentence or statement, usually information about the street railway service, or what might be termed good-will copy. These signs are printed in smaller type than those on the outside because they are read at a comparatively short distance by passengers in the car, whereas the outside signs may be read 40 or more feet away.

These window signs are changed once a month. Some of the copy used for the outside lettering follows: "Use the street car, safe, economical, dependable." "Use the street car, avoid accident liability." "Street cars are the best means of going to and from town."

The following have been used on the inside of cars. "One of the ways to relieve traffic congestion is to use the street car." "A good street car railway system is essential to a city's progress." "One hundred extra cars are used to carry the rush-hour crowd every afternoon." "If you have any commendation or criticism for our service, write to us about it."

These cards are painted by colored stencil process and the reverse side is printed on a press. They are relatively inexpensive when used in large quantities.

Dash Posters Also Carried

In addition, dash posters of heavy cardboard are carried on both ends of the car and are changed weekly. Approximately 90 per cent of these spaces are used for posters carrying messages and slogans similar to those used on billboards and other advertising of the company. The other 10 per cent is used for carrying posters for local organizations, advertising amateur performances, religious and educational meetings, etc. This space is also used for advertising baseball and football games, circuses, theaters, etc., all of which help to increase street car traffic. On occasions when large conventions are being held in the city special dash posters are used,

Attractive window signs in colors amuse the car riders and teach a lesson

reading, "Welcome, Visitors! Let us serve you!" or some similar message.

Other wording that has been used is: We try to avoid accidents, do you?" "Let us solve your parking problem."

Views are published of typical attractive window signs, a typical dash sign and a drawing showing the method of making the frames for the signs.

Moving Pictures Found Effective

Moving pictures have also been used very advantageously in the publicity program. A short movie reel was made entitled "Mrs. Birmingham Goes Shopping." The rôles were taken by members of the transportation department and the narrative of the scenario included a satire on the difficulties of finding a parking place and getting through congested traffic. The reel was run for a week in a leading downtown theater and then made a tour of the suburban theaters. As the picture contained several excellent comedy situations and

Digitized by Google

Dash signs are changed once a week and are held in a frame for their protection

made no direct mention of the company, the theaters showed it free of charge.

A series of ten short films, or trailers, have also been used during the year. Several of these dealt with the parking problem; others suggested using the street cars for going home to noonday lunch, while still others depicted the various operations incident to maintenance, such as car washers in operation.

Display advertising has been used each week in each of the three daily newspapers. After trying several different sizes and styles of ads, the company decided to use one large advertisement each week in each of the three papers, rather than running a small advertisement more frequently. These advertisements are as a rule approximately a quarter of a page and are such that they will dominate the page and will force their attention upon the reader.

All copy for newspaper advertisements is prepared by members of the company's staff, but a commercial artist is employed from time to time to prepare illustrations. The cuts are usually such that they can be used a number of times by changing the copy. An old cut run with new copy, after an interval of a month or more since its last publication, is considered as effective as an entirely new illustration. All newspaper copy has been limited to short statements about the service and is designed to tie in with the other mediums of advertising which are used.

One subject about which much of the advertising in newspapers has been built is that "the street car is the most convenient and satisfactory means of going to and from the crowded business area."

In addition to the advertising in the daily papers, four ads are carried in practically every weekly paper published in the country, including two negro papers and two papers published in Italian. Programs and papers published by schools and churches and fraternal and labor organizations are patronized to a limited extent.

Direct Solicitation

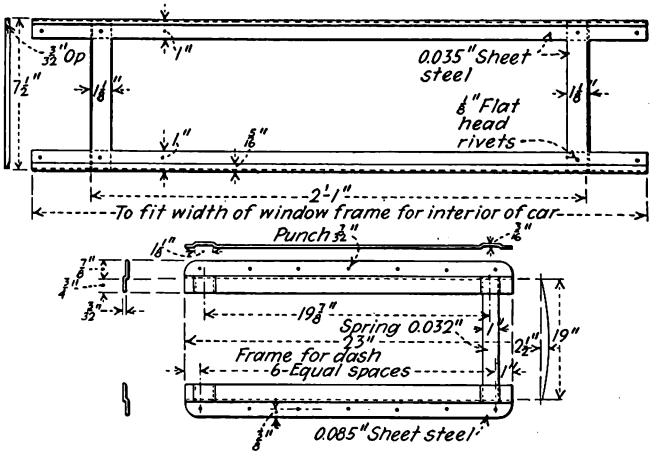
Occasionally direct solicitation for business has been undertaken. One case was in a district which formerly had been served by a shuttle line, but where it was decided to install through service. The neighborhood concerned was a fashionable one where many of the residents had more than one automobile per family, but the line never had enough revenue even to pay operating expenses.

The week before the new through service was put in effect five trainmen were selected to make a house-to-house canvass of the territory served by the line. They were coached to deliver a short talk concerning the through service and the new schedule. Small cards announcing the plan and containing the detailed schedule on the back were printed for distribution. The various canvassers, under the supervision of the efficient chief inspector, called at every house in the territory served, explained the new service and left one of the cards containing the schedule. Schedule cards were also placed in the various drug stores in the distirct and distributed by the car crews during the week prior to the opening of the new line.

When the new service was inaugurated a noticeable increase in traffic was felt, and motor car owners who never patronized the line before became regular patrons. The results were so satisfactory that a similar canvas and distribution were made when another line began through service several months later.

That the company's broad program of selling its service has been successful is shown by the steady increase in patronage which has resulted. The total number of passengers transported during the past three years is as follows:

1924	67,345,838
1925	69,235,321
1926	70,775,375



These are working drawings of the frames used for dash and interior signs at Birmingham, Ala.

Earnings for the first four months of 1927 exceeded the earnings during the same period last year by $5,562.49.

This increase is doubly remarkable because it was obtained during a period in which the number of automobiles per inhabitant was increasing at an unprecedentedly rapid rate.

Brooklyn-Manhattan Transit Corporation articulated subway unit with three bodies and four trucks

Articulated Cars

Meet Unusual Requirements

This type of car is suitable for heavy loads on subway and surface lines, but is not flexible where small units are needed at certain periods

By W. J. Clardy

General Engineer Westinghouse Electric & Manufacturing Company

CONSIDERABLE study has been given the articulated car, both in the United States and in foreign countries. Permanently coupled cars, which are closely allied with articulated units, have also received some attention. Both types appear to have advantages for meeting certain unusual requirements, but their field is more or less limited.

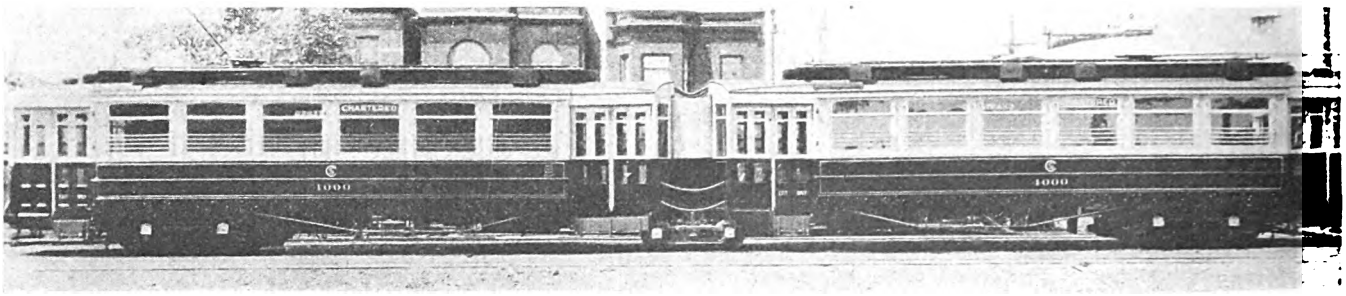
Of the important articulated cars illustrated, the most popular consists of two bodies mounted on three trucks. Longer units are practicable from a construction standpoint, as that of the Great Northern Railway of England, which is made up of five car bodies on six trucks.

The permanently coupled units consist of two complete cars connected in a manner which precludes their separation while in normal service. Such units can be split up easily when they are shopped and little special construction is involved. Not more than two car bodies have been joined in a unit.

The field for articulated and permanently coupled cars is restricted because such units are much less flexible than single cars. The most extensive use of articulated units has been in subway service where relatively long trains are required, even during non-rush hours. One principal advantage is the practical elimination of nosing. This results in better riding qualities and a material reduction in track maintenance. Permanently coupled cars are also used in subway service, but the advantages are not as great with respect to track maintenance and riding qualities as for articulated cars.

Surface operation of articulated and permanently coupled units is likewise restricted. Two-car units are frequently useful in rush hours, but traffic rarely demands

Digitized by Google



Chicago Surface Lines articulated city car

more than single cars for the non-rush. Investment in equipment that can only be economically used during heavy traffic periods is difficult to justify. Where traffic demands two or more cars in trains in all-day service, the articulated car can be used. In fact, it offers an excellent opportunity to secure lower operating costs by reducing expenditures for maintenance, power and platform labor. A recent adoption by a high-speed, heavy-traffic interurban illustrates the utility of articulated cars.

Brooklyn Subway Cars Have Three Bodies

Articulated cars are being generally used by the Brooklyn-Manhattan Transit Corporation in subway service. In 1925 four trial articulated cars were introduced. Their success led to the purchase of 67 additional units in 1926 and 50 more in 1927.

These articulated cars consist of three car bodies mounted on four trucks with 200-hp. motors on the front and rear trucks in the first four triplex cars. In the later cars one motor is placed on each truck. The electrical apparatus really comprises two complete subway equipments with a total of four motors and two sets of control per unit. The complete weight of one articulated unit is 106 tons.

Articulated car subway operation in Brooklyn demonstrated several operating advantages as follows: (1) Reduced track maintenance incident to elimination of nosing; (2) improved riding qualities; (3) less train friction, resulting in energy economy; (4) passage between car bodies of a unit giving better distribution of load.

The units are suitable for both express and local service. A non-rush-hour train consists of two triplex cars, while three are used during the rush. Variations in headways, together with the relatively large capacity that must be provided even in non-rush-hour trains, make the triplex car sufficiently flexible to meet Brooklyn subway requirements.

An articulated unit known as a "duplex car," placed in service on the Brooklyn surface lines in 1924, was constructed from old equipment. It consists of two car bodies mounted on three trucks. This is entirely experimental and no further use has been made of equipment of this type on surface lines in Brooklyn.

Boston Elevated Railway Uses Permanently Coupled Cars

The Boston Elevated Railway operates a number of permanently coupled cars in subway service and has experimented with articulated cars on surface lines. A definite program for the retirement of old equipment is in effect and developments that promise more economical operation are carefully investigated.

The permanently coupled cars are used in the East

Boston Elevated Railway permanently coupled subway cars

Boston Tunnel. On account of clearance limitations it was necessary to build small, light-weight, double-truck subway cars. There are 40 of these, weighing 44,000 lb. complete with all equipment excluding load. They are equipped with four 40-hp. motors mounted on 26-in. wheels. There are three sliding doors on each side of the cars and end doors which permit passage between cars. The equipment is arranged for operation in units of two cars permanently connected. It is possible to separate the cars of a unit, but it is necessary to do it in the shop. Trains are made up of one or more two-car units. The new equipment has proved very satisfactory in this service. Permanently coupled cars do not have all of the advantages of articulated units with respect to "nosing," but the riding qualities are good and operation here is efficient.

The articulated units experimented with on surface lines were constructed from two old single-truck cars. Operation was not particularly successful and no service is maintained at present with this type of equipment.

W., B. & A. Runs Articulated Cars in Interurban Service

The Washington, Baltimore & Annapolis Electric Railroad placed ten articulated cars in service last spring. Each unit consists of two car bodies mounted on three trucks, both the front and rear trucks being equipped with two 125-hp. motors. The total weight of a complete unit is 58 tons.

The cars are used in half-hour limited service on the main line between Washington and Baltimore. The distance is 40 miles and the running time 85 minutes, a schedule speed in excess of 28 m.p.h. Normally one articulated car is run, but electro-pneumatic unit switch train control is provided, as two units are required to handle heavy travel. Comfortable, spring-cushioned, mohair-upholstered seats arranged to revolve in pairs are a feature of the cars. Savings in maintenance, power and platform labor promise an attractive return on the investment in the equipment.

The Milwaukee Electric Railway and Light Company has used on the surface lines for several years articulated units consisting of two car bodies mounted on three trucks. These were constructed in the railway company's shops from old equipment. The vestibules were removed from one end of each car and the cars joined together through a swivel link, supported on a new truck. The complete weight is 75,000 lb. There are four 65-hp. motors, two on the front truck and two on the rear truck. Drum control is used, since there is no necessity for operating more than one unit.

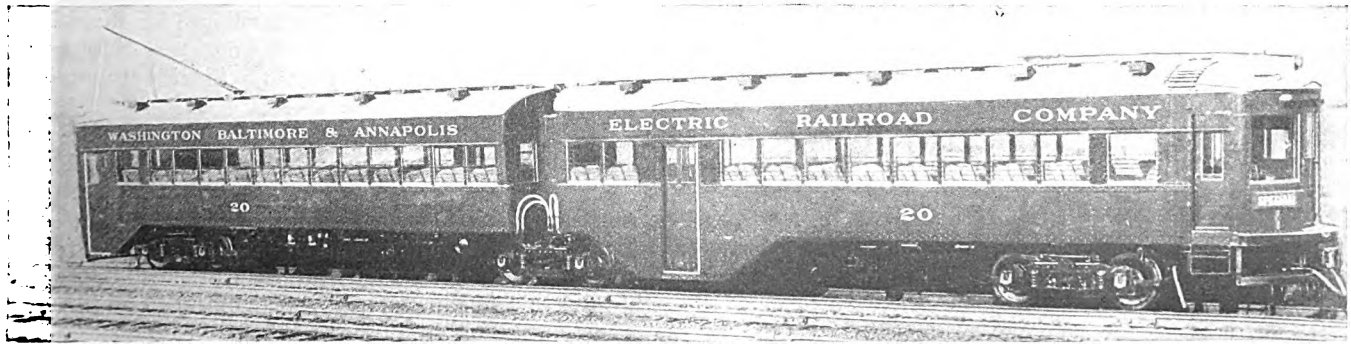
These three-truck articulated cars were built primarily for rush-hour, heavy-load trips. The units are economical during periods of heavy travel, since only two platform men are required. The conductor is located in the vestibule between the car bodies. Operation is center-entrance, pay-as-you-enter, front or center exit. They have proved satisfactory after several years service.

United Railways & Electric Company Has Both Types

The United Railways & Electric Company of Baltimore is making extensive use both of articulated and permanently coupled cars. Experience has indicated that the articulated cars are the most satisfactory. All units now being built and planned for the future are articulated. There are 28 of the articulated cars in Baltimore. They weigh 66,000 lb. complete. Each unit consists of two car bodies mounted on three trucks with two 65-hp. motors on each end truck. Double-end electro-pneumatic unit switch control is used. Two old cars are rebuilt to form each articulated car, but new electrical equipment is applied.

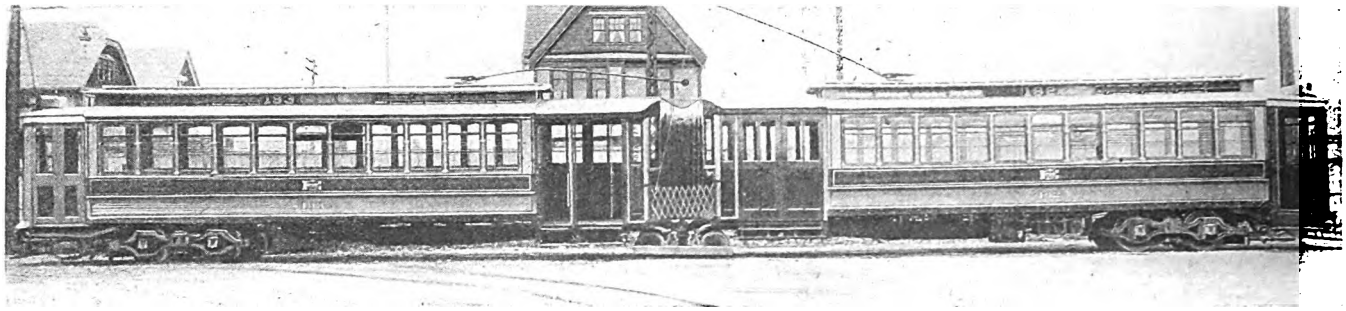
The articulated cars are operated front-entrance center-exit with only two platform men. Normal running is single end and the controller at the rear is used only in emergency. The cars were constructed primarily for rush-hour service. While used mostly during the heavy traffic periods, they sometimes are run throughout the day. The articulated units have proved successful in Baltimore and some attractive operating economies are being realized.

The Department of Street Railways of the City of Detroit purchased a special four-truck, three-car body



Washington, Baltimore & Annapolis Electric Railroad articulated interurban car

Digitized by Google



The Milwaukee Electric Railway & Light Company articulated city car

articulated car some time ago for trial in heavy city service. The unit has four 60-hp. motors, two on each of the end trucks, with drum control for single-end operation. The complete weight is 75,000 lb.

No additional articulated cars have been purchased for Detroit, though their use on heavy traffic lines has been contemplated. A few routes require two-car trains in all-day service and offer opportunity for economical service with articulated units. The Woodward Avenue line has such heavy traffic that it is difficult to provide sufficient service with two-car trains. Three-car trains could be used to advantage and possibly the articulated triplex unit would offer a means of effecting an economy.

Chicago Surface Lines Tries Articulated Unit

The Chicago Surface Lines built an articulated unit consisting of two car bodies mounted on three trucks. It was constructed from old cars early in 1927 and has been in service since that time. It is equipped with four 50-hp. motors, two on each end truck, and double-end drum control. The complete weight is 72,000 lb. and seats are provided for 91 passengers.

It is not planned to construct and operate additional articulated cars in Chicago. The performance of the present unit has indicated that economies are not sufficient under existing operating conditions to justify extensive use of rolling stock of this type.

Readers' Forum

The Off-Peak Load Can Be Built Up

Mount Vernon, N. Y., Jan. 4, 1928.

To the Editor:

Henry W. Blake's article in the Dec. 10 issue on "Fares and Fare Collection in Europe" and his Dec. 24 article on "Answering Questions Before They Are Asked" should be read and reread by every American operator interested in the sale of the ride.

The last two or three years have seen a thorough overturn of ideas on car appearance and upholstery. That is all to the good. Yet it is not enough to provide better goods; we must also know how to price them and how to suggest objectives for riding. It is astonishing how the same management which spends hundreds of thousands of dollars for new cars will hesitate to plunge for a fraction of that amount in trying to sell rides.

We have been hearing much lately about increased rush-hour business going hand in hand with decreased off-peak business. Should this condition be taken for granted? What claim can we lay to salesmanship and sales effort if we are going to assume that all our patronage is compulsory?

European roads offer helpful suggestions here. You do not have to follow their copper zones, but you can have 5-cent short-haul fares rather than no fares at all. Look over the variety of fares in London alone, and ask yourselves if you have no opportunity to do something with lower rates in the shopping hours. Why the slogan of "Shop more from 10 to 4" unless you put some inducement back of it? Don't let the bugaboo of non-registered fare prevent you from trying plans that make the ride more agreeable through elimination of change-making and transfers. Bear in mind that the healthiest group of electric railways in America—those of Canada—manage to get along with half our fare—checking labor. Don't let the accounting tail wag the transportation dog where more revenue from more riders is concerned.

To return to the lament about loss of off-peak traffic, it is a loss to be expected on a flat-fare system because the off-peak rider is not under the same urge to use the trolley service. But it is not unavoidable. More off-peak and short-haul fares supply the natural answers. The less the prospect needs us, the more we should seek his business.

A beginning in this direction has been made by the Pittsburgh Railways, which shows a condition directly opposite to the usual American complaint. On this property the peak or necessity riding has decreased in proportion, probably, to decreased employment. On the other hand, the off-peak or voluntary riding has increased. Better off-peak service through one-man cars and more attractive, more reliable equipment have helped to produce this result. However, the basic reason is the adoption of at least three fare plans that encourage off-peak patronage.

One of these is the 5-cent short-haul fare in use on more than a dozen routes. It encourages neighborhood shopping between the business peaks and neighborhood theater travel at night.

The second and most important of these plans is the weekly pass, of which some 60,000 are sold. As the pass rider cannot take more than two peak rides a day, it is obvious that his additional two or even four rides must be off-peak. They also tend naturally to be short-haul.

The third plan is the Sunday-holiday pass, which has proved that people in Pittsburgh will ride the trolley without compulsion.

These three schemes are far from exhausting the possibilities in pricing the ride according to quantity, length and time purchased. They do prove, however, that there can be no talk about ride salesmanship without differentiation in the rate of fare. Let more railways follow Pittsburgh's example and then we can have hopes for still greater refinements, more particularly in adding off-peak passes, as urged by the writer for years past.

Walter Jackson.

C.E.R.M.M.A. Inspection Rules and Uniform Charges

IN THE rules covering the condition and repair of freight cars for interchange service as adopted by the Central Electric Railway Master Mechanics Association May 11, 1927, and made effective Jan. 1, 1928, and as published in ELECTRIC RAILWAY JOURNAL for May 28, 1927, the following changes should be made:

In Standard No. 3, paragraph 1, last line should read: "The Central Electric Railway Master Mechanics Association. The words Master Mechanics have been added.

In the various inspection forms shown on standard sheets Nos. 7 and 8 the letters C.E.R.M.M.A. should be added so that they will read Form C.E.R.M.M.A. 1, 2, 3, 4, and 5. The same addition is to be made in the text wherever these forms are mentioned as in rules 2, 5, 6, 10, 12, 26 and 27.

Fig. No. 2 has been given to the standard axle shown on standard sheet No. 7.

On standard sheet No. 8 the repair card should have a heading "Central Electric Railway Master Mechanics Association instead of Master Car Builders Association.

On standard sheet No. 4 Fig. 2 should be changed to Fig. 3.

On standard sheet No. 5, rule 15, fourth line from the last, the word flat should be inserted before spot.

After rule 18 (c) the following should be added:

(d) No welding of axles is permissible except at the button which may be built up.

In rule 21 Fig. 2 should be changed to Fig. 3.

In paragraph (b) of the rule, third line, the words "in Fig. 3" should be inserted after B.

The following paragraphs (d) to (p) inclusive should be added to rule 21 and be made effective as of date Jan. 1, 1929.

(d) Periodic repacking of journal boxes, after the expiration of twelve months, as indicated by the stenciling on car, regardless of the responsibility of handling company for change of wheels or other repairs.

(e) All journal boxes shall be jacked; all journal wedges and bearings removed for examination, and renewed where necessary; all boxes cleaned and repacked with properly prepared packing (new or renovated) in accordance with C.E.R.M.M.A. recommended practice, and car stenciled. Dust guards shall be renewed, when necessary, only where wheels or journal boxes are changed.

(f) The place (railroad and station), month, day and year of repacking shall be stenciled on car body near the body bolster at diagonal corners with not less than 1 in. figures and letters, using the same station initial as is used for air-brake stencil. This provision also applies to new cars.

(g) No change shall be made in the stenciling unless all boxes are repacked and the work complete, in all details, has been performed.

(h) If car bears no stenciling showing date of previous repacking, all boxes may, if necessary, be repacked in accordance with paragraphs (e) and (f).

(i) This work shall be done only when cars are on repair track for other repairs.

(j) No charge shall be made for repacking, etc., if performed within twelve months from date stenciled on car.

(k) No charge shall be made for repacking, etc., unless all boxes are repacked and the work complete, in all details, has been performed.

(l) Work performed, in accordance with the foregoing, may be charged to car owner at prices specified in Rules.....

(m) Journal bearings having back or lug broken or cracked, or length reduced ⅛ in. or more, or lining loose, cracked, broken, spread over side or worn through to brass, shall be considered as requiring renewal.

(n) Journal bearing wedges cracked, broken, or top radius worn flat lengthwise of wedge, shall be considered as requiring renewal. Care must be taken to see that wedges are not scrapped for wear unless top radius is actually worn flat.

(o) The periodic repacking, etc., does not contemplate any change in the ordinary attention as to oiling and packing when necessary.

(p) At time of periodic repacking inspection must be made of all axles for defects and limits of wear. If defects are found axles should be changed or owner notified on Form C.E.R.M.M.A.-1.

In rule 29 the last sentence should be omitted.

In rule 37 the following should be added to the last sentence so that it will read "Standard safety appliances as applied to electric railways must be completely applied.

The following rules 38, 39 and 40 should be added:

"Rule 38. Bills for repairs made under these rules and for material and labor furnished shall be in conformity with schedule of prices and credits for the articles enumerated plus 15 per cent. Bills shall not be rendered for less than $1 but charges for a less sum than $1 may be held till they amount to that sum."

"Rule 39. All worn out and defective

APPENDIX (E)
Car Body

86 No credit to be allowed for scrap lumber when renewing doors, floors, or other parts constructed in whole or in part of work.
95 Altering height of car body to keep couplers at proper height to be charged at cost.
106 Any car requiring general repairs due to owners defects on which the estimated cost of repairs exceeds $150 shall be inspected by the handling line and a careful estimate made of the cost of necessary repairs and forwarded to car owner, who will then inspect the car if he so desires, shall within thirty (30) days authorize repairs or further disposition of the car, shipping to handling line such material as he may see fit for use in repairing car. In case repairs are to be made by handling line.
107 In no case shall the total charge for actual repairs exceed the estimate by more than $50.00 unless authorized.
108 If the owner authorizes destruction of car, handling line shall allow credit for all material at scrap prices less labor required for destruction.

Association Activities

International Association to Meet in Rome, May 6-12

THE Union Internationale de Tramways, de Chemins de Fer d'Intérêt Local et de Transports Publics Automobiles has set the days of May 6-12 for its meeting in Rome, Italy, this year. A feature of this meeting is that it will mark the consolidation of this association with the former Internationaler Strassen- und Kleinbahnverein. This means a return to the conditions existing before the war, when there was only one association representing the street railway, interurban railway and bus interests in Europe.

The detailed program of the Rome meeting will soon be made public.

A recent letter from the secretary of the association says the association would be very glad to have any members of the American Electric Railway Association participate in the Rome convention, and they are cordially invited to do so.

A preliminary program of the Rome meeting was published on page 278 of the issue of this paper for Aug. 13, 1927.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Jan. 16-17—Midwest Electric Railway Association, Arlington Hotel, Hot Springs, Ark.

Jan. 18-19—Kentucky Association of Public Utilities, annual meeting Brown Hotel, Louisville, Ky.

Jan. 18-19—Central Electric Traffic Association, Hotel Gibson, Cincinnati, Ohio.

Jan. 25—Central Electric Railway Master Mechanics' Association, Hotel Gibson, Cincinnati, Ohio.

Jan. 25-26—American Railway Association, Motor Transport Division, organization meeting, Palmer House, Chicago, Ill.

Jan. 25-27—Electric Railway Association of Equipment Men, Southern Properties, Roosevelt Hotel, New Orleans, La.

Jan. 26-27—Central Electric Railway Association, Hotel Gibson, Cincinnati, Ohio.

Jan. 31—New York Electric Railway Association, annual meeting, Hotel Commodore, New York, N. Y.

Feb. 13-17—American Institute of Electrical Engineers, winter convention, New York, N. Y.

Feb. 17-18—Central Electric Railway Accountants' Association, Hotel Gibson, Cincinnati, Ohio.

May 2-5—Southwestern Public Service Association, Dallas, Texas.

July 8-12—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention, Cleveland, Ohio.

A.R.A. Motor Transport Men to Organize

PERMANENT organization of a Motor Transport Division of the American Railway Association will be effected at a meeting called for Jan. 25 and 26. It will be held at the Palmer House, Chicago. This meeting, which has been called by President R. H. Aishton of the A.R.A., will also give an opportunity for discussion of the scope of the work to be covered by the new division. The organization is in the hands of a general committee, of which A. P. Russell, vice-president New York, New Haven & Hartford Railroad, is chairman. G. M. Campbell, assistant to the secretary of the A.R.A., has been appointed secretary of the Motor Transport Division.

It is planned to distribute the activities of the Motor Transport Division of the American Railway Association among three sections, to study the application to steam railway service of the motor coach, the motor truck and the rail motor car respectively. The purpose of the organization wil be to bring together the railways interested in the development of motor transportation, freight and passenger, in order that they may study the problems arising therefrom, and, through co-operation, devise the most effective means possible for the development of such transportation. The membership in the division will be confined entirely to representatives of railways or their subsidiary operating companies.

American Association News

Engineers' Response Increasing on Letter Ballots

RETURNS on the letter ballots sent out by the American Electric Railway Engineering Association show increased response and indicate that as the new method of voting on engineering standards becomes better understood it promises to give far better results in the adoption of new engineering standards than did the old method of voting on the convention floor.

The first letter ballot, dated Sept. 17, included six standards that were submitted for approval. Three items were included in the second group of proposed standards in the letter ballot dated Nov. 2. The ballots received have all been counted. The returns on the second group were more than twice those received on the first group. The vote showed a large majority in favor of the adoption of the three recommendations submitted.

A third group of questionnaires is now before the engineers of the industry. These questionnaires are dated Nov. 25 and include rolling stock ballot R.S. 13, covering limits of wear at points affecting the maintenance of proper gear centers; way and structures ballot W.S. 2, covering minimum dimensions for center plates on single and middle frogs, and way and structures ballot W.S. 6, covering rules for arc welding and specifications for welding rods. Returns on this third group of ballots are coming in strongly and promise to exceed the returns received on the second group.

G. C. Hecker, special engineer of the association, who has charge of the compilation of these returns, reports that the response to this method of voting, as the use of the letter ballot becomes better understood, indicates that the new plan is working out successfully and promises to give a far more representative vote of the industry in the adoption of new standards than was formerly obtained in the old plan of voting on the convention floor.

Bulletin to Give Committee Lists

PUBLICATION of the membership lists of the various association committees will be in the form of a separate bulletin this year. This was decided on at a recent meeting of the publications committee of the American Association. This list will be accompanied by a general index of all committee members, giving their complete addresses and business connections. The committee lists will not be published in *Aera* each quarter as heretofore.

It is not expected that copies of the bulletin will be sent generally to *Aera* subscribers, but a copy will be sent to each committee member as well as to each company member. Additional copies will be sent to any other association member on request to J. W. Welsh, general secretary, 292 Madison Avenue, New York City

News of the Industry

New York's Governor Discusses Home Rule and Buses

In his message to the Legislature of New York Governor Smith said:

This decade has seen several changes in our administrative policy toward public utilities. There is no need to rehearse the past. We have wavered from unified control to separation of functions. At present we have the Department of Public Service for state-wide regulation with the Transit Commission as a part of it having local jurisdiction in the city of New York. Construction of transit facilities in New York City is now entirely removed from state control and lodged in a local Board of Transportation. This is at least a partial recognition of the home rule principle.

All along I have stood for the right of a locality to regulate a public utility operating wholly within its borders upon the theory that the service is being rendered to the people of a single city and the elected officials of the city are held responsible in the first instance. The people look to them and not to the state. There is also no reason why the state should not delegate its police power for the regulation of public utilities to the properly elected officials of a municipality.

Transportation is so vital to the needs of every community that there is no reason why a municipality should not be permitted to supply it to its citizens. If that be true there is no reason why a city should not be permitted to operate public buses for the convenience and comfort of its citizens. There is nothing new or revolutionary about the theory of municipal ownership. New York City owns and operates ferry boats. Four cities of the state own and operate their electrical plants. A large number of villages either generate their own electricity or own a distributing system. Some villages operate gas plants. I simply recommend that the principle now in practice in New York City and in other parts of the state be extended to all forms of utilities and be made applicable to all cities wherever there is an expressed desire on the part of the majority of the citizens for the exercise of such a right.

Traction Not Included in Illinois Session

In calling a special session of the Illinois General Assembly to meet on Jan. 10, Gov. Len Small failed to include traction as one of the subjects to be considered. This makes it impossible to proceed with the proposed settlement of the Chicago railway problem prior to the regular session of the Legislature in 1929 unless another special session is called. It is being proposed that after the subjects in the present call are disposed of by the Legislature, another call should be issued by the Governor including all subjects relating to Chicago traction. There is considerable support of this plan in the city administration and the City Council has adopted a resolution urging the Governor to make such a call.

One of the subjects relating to traction may not be included. This is the proposed provision giving the city authority to spread special assessments for subway construction over a longer period than five years. Corporation Counsel Samuel A. Ettleson has found a provision in existing law which he believes gives the city this authority. For terminable permits, repeal of the existing 20-year franchise limitation and authority permitting the elevated and surface lines to consolidate, legislation is necessary under the plan being considered.

If another call is agreed upon including these subjects it can be issued before the end of the present special session, making consideration of transit really a continuation of this session. Decision on this matter rests entirely with the Governor, who has frequently stated that he would not call a special session unless both the utilities and the city were in agreement on the bills that are presented.

Continuation of Public Control Urged

Division of Metropolitan Planning would change name of Elevated to Boston Transit Company, realign financial structure and carry out plans for $40,000,000 expenditure

WITH more certainty of its facts and the legal status of its plans the Division of Metropolitan Planning of the Metropolitan District Commission has submitted to the Massachusetts Legislature for 1928 new plans for the expansion of the Boston Elevated, to cost about $40,000,000. Henry I. Harriman is chairman of the division, and associated with him are A. C. Ratshesky, Ralph S. Bauer, Richard K. Hale, Everett E. Stone, Frank H. Hall and James B. Noyes, and they are unanimous in their recommendations.

Two problems relating to the Boston Elevated Railway confront the Legislature. First, such legislation as is required to insure the immediate construction of much-needed additional rapid transit facilities, and, second, a determination of the policy of the Commonwealth as to continued public control of the road. Both of these problems were before the Legislature in 1927. The Supreme Court has said that the Legislature has the right to provide for the re-arrangement of the securities of the elevated road in the manner agreed upon last year in the joint legislative committee on metropolitan affairs and street railways. The Supreme Court has decided also that betterments may be assessed in connection with the rapid transit line extensions. This clears the way for legislation this year which could not be acted upon last year

The division reports that it cannot recommend the return of the road to the stockholders and the resumption of private management, cannot advocate the cancellation of a state option to purchase the road at millions less than its reproduction value and "cannot favor a policy which might foist increased fares upon the car riders of the Metropolitan District."

Accordingly, the division again reports in favor of a continuation of public control under somewhat new conditions which it deems equitable to both the public and to the company.

The bill which the division reports for the re-organization of the elevated railway contains the following important provisions:

1. A change of the name of the corporation to the Boston Transit Company.

2. An extension of the period of public control for a period of fifteen years, public control thereafter to be continued in force until repealed by legislative enactment.

3. The division feels that with an extension of public control for a period of 25 years or longer it would be reasonable to reduce the guaranteed dividend rate on the common stock to say 5½ per cent, thus effecting a saving of $125,000 per annum, but that with a shorter period of public control a reduction of the dividend rate is not warranted. While the saving resulting from a lower dividend rate on the common stock would be desirable, the division feels that the gain thus effected would not equal the advantage to the Commonwealth of being able to review the whole Elevated situation at the end of a fifteen-year period. Accordingly the division recommends a fifteen-year extension without a reduction in the dividend rate on the common stock.

4. The transfer of the three classes of preferred stocks now outstanding into income bonds, this being accomplished either by voluntary exchange or by eminent domain proceedings. The income bonds would bear interest at 4 per cent per annum, would be guaranteed by the Commonwealth as to both principal and interest, would be tax free in Massachusetts, would run for a period of 40 years and would carry a sinking fund that would retire them before maturity.

If 4 per cent income bonds are issued in exchange for outstanding preferred stocks on the basis hereinafter outlined the savings in dividends and in state and federal taxes will be about $1,175,000. This sum should be set up as a fund to be used for the following purposes:

(a) To create a sinking fund which will retire the income bonds at maturity.

(b) To retire the debt of $2,200,000

Digitized by Google

which the Elevated now owes the cities and towns served by it.

(c) Any balance to be used for the payment of interest and sinking fund on additional rapid transit facilities.

5. In order that the income bonds to be issued under the proposed reorganization act shall sell at par it will be necessary that they carry the guarantee of the Commonwealth and that they be made tax free in Massachusetts.

6. Rotation in the term of service of the public trustees, one trustee being appointed every two years.

7. Acceptance by the elevated road of a bill calling for additional rapid transit facilities substantially as provided in the second bill accompanying this report.

8. Acceptance of this act by a majority of all the stockholders entitled to vote at a meeting held for that purpose, stockholders voting as a whole and not by classes.

The elevated road now has outstanding approximately $24,000,000 of common stock upon which 6 per cent dividends are paid and three classes of preferred stock, as follows:

First preferred 8 per cent stock	$6,400,000
Second preferred 7 per cent stock	13,650,000
Preferred stock 7 per cent	3,000,000
Total	$23,050,000

The dividends on these preferred stocks amount to about $1,675,000 a year. The $3,000,000 of 7 per cent stock is callable at 105. The first and second preferred stocks are not, however, callable and must therefore be acquired either by voluntary exchange or by eminent domain proceedings, and the bill accompanying this report provides for voluntary exchange, so far as the stockholders are willing to exchange, and for the condemnation of the balance of the stock.

The division suggests that the preferred stock be exchanged into 4 per cent income bonds, the bonds running for a period of 40 years, carrying a sinking fund which will retire them in that period, and having the guarantee of the commonwealth of both principal and interest. Last year the recommendation was for a 4½ per cent bond, but money rates are now easier. The division says it cannot be denied that thus far the state has treated the stockholders of the elevated both fairly and generously and it believes that fair dealing warrants the continuation of that policy.

Accordingly the division suggests that the owners of the three classes of preferred stock be permitted to exchange their securities into 4 per cent income bonds at the following share prices:

8 per cent first preferred stock	130
7 per cent second preferred stock	115
7 per cent preferred stock, its call price of	105

These prices are substantially higher than present market quotations and in the opinion of the division should be attractive to the stockholders of the road.

As the division sees it, an exchange of the preferred stocks on the above basis would call for the issuing of a little less than $27,200,000 of bonds, upon which the maximum interest charge would be about $1,100,000, thus effecting a saving of $575,000 over the present dividends on the preferred stocks.

The division estimates the savings as follows:

Dividends on preferred stocks	$575,000
Federal taxes	260,000
State corporate franchise tax	340,000
Total	$1,175,000

Of the above savings $300,000 a year should be set aside as a sinking fund to retire the new income bonds of the road. An annual sinking fund of that size invested in the income bonds, which should be callable for the sinking fund, will retire them by the end of the 40-year term for which they are to be issued. The division says:

The elevated road now owes the cities and towns served by it approximately $2,200,000. This represents moneys which the cities and towns advanced through the Commonwealth to the elevated to meet the guarantees of the public control act when its earnings were insufficient. This money should be promptly repaid. We accordingly recommend that, after setting aside the sinking fund of $300,000 as above provided, the balance of the savings effected be first used to repay this debt to the cities and towns. When that debt has been repaid, we recommend that the savings thereafter be set up in a reserve fund which shall be used to pay the interest and sinking fund on additional rapid transit extensions. Any rapid transit extensions will necessarily take several years for construction and during the construction period, the interest and sinking fund on such expenditures are carried as a part of the construction cost. Accordingly the debt to the cities and towns can be repaid before any lease by the elevated of new rapid transit facilities goes into effect.

The total annual savings to be effected by the plan outlined in this report are estimated at $1,175,000. From this saving must be taken the $300,000 required for the sinking fund for the income bonds. There will thus be left $875,000 which can be applied to the payment of interest and sinking fund charges on new subways and rapid transit facilities. This means the carrying charges on approximately $20,000,000 of such expenditure and makes possible the immediate construction of new subways.

Turning to the question of extension of lines the division finds that a comprehensive rapid transit plan can now be authorized with every prospect that it will not add any burden to the car riders of the Metropolitan area. It accordingly recommends the immediate construction of two new through rapid transit routes which can be built at an estimated cost of from $35,000,000 to $40,000,000, and also an extension of the Washington Street rapid transit route from its present northerly terminus in Everett to Malden and Saugus.

The total length of the two lines is approximately 14 miles, of which about 27,500 ft. will be existing subways or viaducts, 25,000 ft. new subways or viaducts and 20,500 ft. on private rights-of-way adjacent to railroads.

Chicago Parking Ordinance Effective Jan. 10

To enforce the prohibition of parking in the loop district in Chicago will require the service of at least 400 traffic policemen, according to Frank J. Matchett, head of the police traffic division. The ordinance prohibiting parking was intended to become effective on Jan. 2, but because of time required for publication it will not go into effect until Jan. 10. Under the terms of the ordinance, parking will be barred from practically the entire central business district. It is the intention of city authorities to apply the law strictly to all persons and not to permit anyone to park on the streets affected during the time specified, from 7 a.m. to 6:30 p.m. on weekdays, except Saturday.

A Magazine in St. Louis Seeks a Name

A new monthly magazine will be published in the interest of employees of the St. Louis Public Service Company, St. Louis, Mo., in lieu of the United Railways *Bulletin*, which was withdrawn from publication at the end of the receivership on Nov. 30. Suggestions for a name must be in the hands of the editor of the magazine not later than Jan. 15 in time to publish the first issue of the book under its new title in February. The best choice of name will win $25 in cash and there will be a second and a third prize of $15 and $10. Only street railway employees not holding official positions and members of their families or especially foremen, supervisors, inspectors, motormen and conductors and other employees are eligible to compete for the prizes. Meanwhile the space for the title on the cover page was vacant in the December issue and will be also in the January issue.

Carols from a Houston Car at Christmas

During the week preceding Christmas, residents of Houston, Tex., were treated nightly to Christmas carols provided by the Houston Electric Company, working in conjunction with the musical section of the recreation department of the city. A specially decorated flat car, with a different band each night, was routed over various lines so that the entire city was covered during the week. This unusual way of lending atmosphere to the Christmas season attracted much attention and many families in the residential sections of the city waited up to greet the carolers while in their neighborhood.

Three days before Christmas all the cars and buses of the Houston Electric Company were decorated inside with paper bells and wreaths, while appropriate dash posters were run on the outside of the cars.

Paving and Fare Orders in Mobile

The Alabama Public Service Commission has issued an order allowing the Mobile Light & Railroad Company to take up the track and abandon service on the 2,331 ft. of route of the Charleston-Beauregard line on Texas Street, Mobile, Ala. It is the intention of the city to pave Texas Street and as the Charleston-Beauregard line is an unprofitable one the commission issued the order to give the company relief from paving.

The commission also increased the token rate from four tokens for 28 cents to four tokens for 30 cents. Rates of fare now are: Cash fare, 8 cents; token fare four for 30 cents, 7½ cents; school tickets, books of 30, 3½ cents; second zone, cash fare, 6 cents, and transfers, each 1 cent.

Twin City Lines Extends Xmas Greetings

An unusual Christmas greeting in the form of a newspaper advertisement, entitled "What He Left Behind Him," was extended by the Twin City Lines to all of its patrons. The message printed the last will and testament of a patient in a Chicago poorhouse which was found in his ragged coat pocket. Close investigation disclosed that the writer had been a lawyer and because of its unusual content, the will was probated and made part of the record of Cook County, Illinois. The old patient, Charles Lounsberry, made no disposition of his worldly goods as he had none to leave, but he left something to good fathers and mothers in trust for their children; he left wonderful things to children but only for the term of their childhood, also to lovers and young men, and to those who were no longer children or youths or lovers, he left memory. The message is worth reading and the spirit of the Twin City Lines in offering this as its Christmas greeting is worth emulating.

Who Is a Nominee in Louisville?

Each employee of the Louisville Railway, Louisville, Ky., has been urged to bring to the attention of the award committee, on a form which may be obtained from his foreman, the record of any fellow employee whom he feels is entitled to the Anthony F. Connelly award for the designation "Best Public Servant." All employees are urged to state as fully as possible the reason for their belief that the nominee has rendered the greatest public service during the past year. Nominations can be made any time up to Jan. 10 and the award committee will make its selection and announce the award as early as it is possible to do so. This award carries an annual cash prize of $75 and a medal known as the Connelly award, to be given to that employee of the Louisville Railway or one of its subsidiaries who has during the calendar year rendered, in his individual capacity, the most useful or efficient service to the public which the railway serves.

An Ingenious Plan to Return to the Five-Cent Fare in Seattle

Return of the 5-cent fare on the Seattle Municipal Railway, Seattle, Wash., again becomes a possibility. First steps have been taken to place before the voters of the city a definite proposal for assistance for the municipal railway from the general fund. A "plan or system" ordinance authorizing a tax levy up to 3 mills has been prepared by Corporation Counsel T. J. L. Kennedy and turned over to Councilman Oliver T. Erickson, sponsor of the idea, for introduction in the City Council. It is proposed to place this plan before the voters at the March 13 election. If the ordinance is ratified by a three-fifths vote, it will enable the Council to proceed with the new plan. Under the proposed plan, the Council would be empowered to aid the railway annually with money from the general fund to make up deficits anticipated during the year, provided the appropriations did not exceed 3 mills of the tax levy.

Educational Films Supplied by South Shore Line

Establishment of a motion picture library and free lecture service—available without charge to any individual or organization that applies—has recently been announced by the Chicago, South Shore & South Bend Railroad, Michigan City, Ind. The service includes the furnishing of a trained speaker and operator, projector, screen and a representative selection of films telling the story of cities, recreational opportunities and industries along the South Shore Line.

Titles of the films now available are as follows:

Chicago, the Metropolis of the Midwest (2 reels).
Gary, the Steel City.
Michigan City, the Summer Resort Capital of Indiana.
South Bend, in the Beautiful St. Joseph Valley.
Vacationland Along the South Shore Line.

Two stereopticon films, furnished with the same accompanying service as the motion pictures are ready for release to persons interested: "Our Silent Guardians," a non-technical series describing the operation of South Shore Line automatic block signals; and "Riding on Lightning," a description of the electrical equipment of South Shore Line cars, also presented so as to be readily comprehended by the layman. Bookings for films and lectures are made through the newly organized Public Speakers' Bureau of the South Shore Line.

Transit Policy in Philadelphia Outlined

Upon his induction into office as Mayor of Philadelphia, Pa., Mr. Mackey promised the negotiation of a transit agreement in harmony with the Philadelphia Rapid Transit Company and in co-operation with the Council and the Public Service Commission. He said that of all the problems confronting the administration local transportation was the most important. He believed that Philadelphia to become a greater commercial center must improve and enlarge its transportation facilities. The task had already been simplified by the work done by the present management of the Philadelphia Rapid Transit System, which during its period of incumbency has converted the system from the poorest to one of the best and most efficient. He said he would be guided in the matter of transit by the facts in the case, but that he was convinced that he could rely upon the co-operation of the railway management in furthering any program which had for its object the greatest good for the greatest number.

Specifically speaking, he said that the Broad Street subway should be put in operation as a part of the Philadelphia Rapid Transit System with free transfers. Early completion of feeder lines and adequate downtown terminals were necessary, and in order that the time of the administration spent in negotiation with the company might not be nullified by subsequent disapproval by the Public Service Commission he proposed to invite the commission and the company to collaborate in bringing forth a plan fair to both the city and the company, and to this end he bespoke the co-operation of the City Council.

Turkeys and Hams Awarded in Jacksonville

Another successful safety contest for trainmen of the Jacksonville Traction Company, Jacksonville, Fla., has closed. John P. Ingle, manager of the railway, said the contest revealed that accidents are on the decrease and that the contest was the most successful in the history of the company. As an appreciation for the records made during the 100-day contest, 114 trainmen were presented turkeys for Christmas and 32 conductors received hams.

The contest developed two star operators, R. T. Chism and L. Lammons, who operated more than 9,000 miles each without a single chargeable accident. Winners operated for approximately 275,000 miles during the drive, which opened Sept. 10, at the close of a successful mid-summer campaign. The present drive closed Dec. 18. While more than half of the men who participated in the company's latest drive won first honors, seventeen men were eliminated because they did not work the required number of days, and 23 lost because of chargeable accidents.

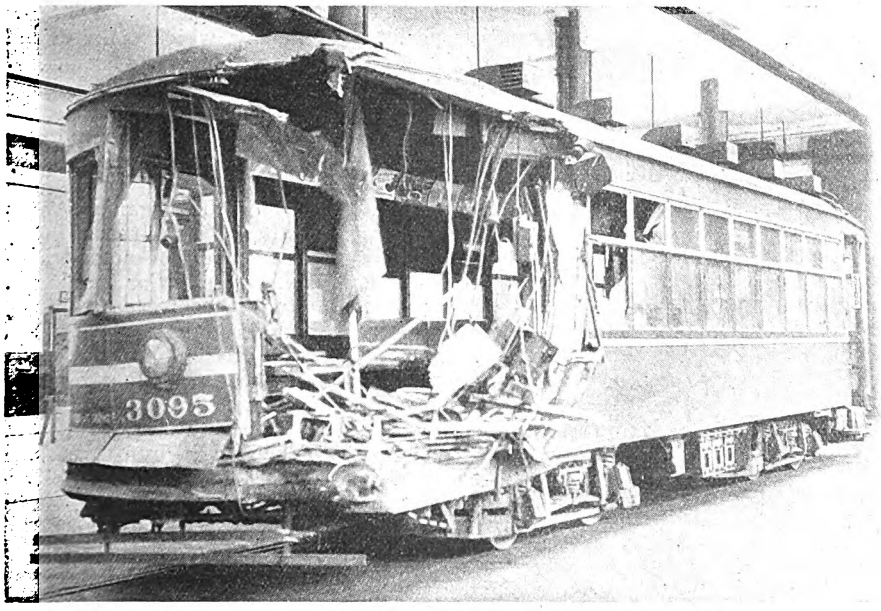
More Records in Chicago

29,576,412 rode Chicago Surface Lines in six days preceding Christmas. 100 per cent operation

WHEN the Chicago Surface Lines attained 100 per cent operation in the Christmas shopping peak of 1926 the feat was recognized as an unusual achievement for a large electric railway system. During the week before Christmas in 1927, however, the company not only duplicated its previous record but succeeded in maintaining 100 per cent operation of all passenger equipment on three days.

On Wednesday, Thursday and Friday, Dec. 21, 22 and 23, every one of the 3,639 passenger cars owned by the company was in service on the streets during the heaviest peak-load periods. On Monday, Dec. 19, all but eight of the cars were in service and on Dec. 20, only one car was laid up for repairs.

During the six days preceding Christmas 29,576,412 rode on the system, an increase of 2,663,049 over the corresponding days in 1926. Adverse weather conditions tended to delay Christmas shopping in Chicago and the huge increase in riding during the week before Christmas is attributed largely to this fact.



In perfect condition four days after, for Christmas rush

The greatest effort and co-operation by the transportation, shops and equipment, track and emergency departments were required to accomplish this.

New records were made by the shops and equipment department in repairing damaged cars. For instance, car No. 3,095 was struck by a skidding cement truck on Dec. 17 and the entire front vestibule was demolished. The accompanying illustration shows the seriousness of the damage done to this car. It was put into the shops at once and a crew of men started working on it. On Wednesday, Dec. 21, it was returned to service in good condition as the result of 735 hours of labor.

Another instance of quick repair work is reported in the case of car No. 5779. At 2:55 p.m. on Dec. 21 an axle on this car was broken in an accident. Instead of hauling the car to the shops an emergency crew took it off the rails and placed it against the curbing, leaving the tracks clear for traffic. New axle and wheels were rushed to the place with a repair crew and at 4:20 p.m.—in one hour and 25 minutes—the car was put back and sent on its way.

In all, there were six cases of heavy damage to cars requiring the repair or replacing of front ends. In each instance repairs were made quickly and the cars returned to service.

Equal efficiency was shown by the employees of other departments. Trainmen were alert to avoid accidents which might disable cars and to make such minor adjustments and repairs as were necessary to keep them running. Emergency crews did splendid work in preventing serious delays.

The 100 per cent operation of equipment on three days enabled the system to handle this enormous load with minimum congestion and maximum speed.

Officials estimate that by being able to use all equipment in the Christmas peak they saved the investment necessary for 200 additional cars the number usually going through the shops. The cost for car and car storage would average about $20,000, making a total saved in capital investment of approximately $4,000,000.

Use of One-Man Cars Extended in Springfield

The Springfield Street Railway, Springfield, Mass., made a further extension of the one-man car system when its Forest Park line was put on that basis recently.

Improved Service in St. Louis

The St. Louis Public Service Company, St. Louis, Mo., which promised the car riders better service when it took over the street car system on Dec. 1, has already taken several steps toward making good the pledge. As a result of a survey into street car traffic 30 additional cars will be placed in service on the Olive, Hodiamont Southampton and Grand lines. A study of the transportation needs of other divisions is now under way.

A new form of transfer was also put in use at midnight Dec. 31 to facilitate the handling of traffic during rush hours and at all other periods. This transfer differs from the old in that when a double transfer is needed the second conductor simply will tear off a stub instead of issuing a new transfer as formerly. The colors of the new transfer are white and red, as under the old system, but contain the words "down" and "up" on their face. The "down" transfer is used for passengers going downtown and on southbound crosstown cars, while "up" transfers are used for trips away from the downtown district and on northbound cars.

Another innovation which is being tried out by the St. Louis company is a stop light for street cars similar to those used by automobiles. The stop light is now being used on only one car, but if it is sufficiently advantageous similar lights will be installed on all cars.

Appeal Filed in Seattle-Von Herberg Tangle

An appeal from the decision of Circuit Judge Frank S. Dietrich who dismissed the Seattle Municipal Railway litigation in the federal courts has been filed by attorneys for John G. Von Herberg, despite the request of the City Council and numerous business men of the city to Mr. Von Herberg to drop the case. The suit was instigated against the city to test the legality of the purchase and bond ordinances giving the bondholders prior lien against the gross revenues of the street railway system. Judge Dietrich, sitting as district judge, heard the arguments in the suit brought by Mr. Von Herberg and also the suit brought by the Puget Sound Power & Light Company, involving the railway system, and sustained a motion to dismiss.

Eight Cents Sought in Joplin

The Southwest Missouri Railroad through its receivers F. C. Wallover and H. C. Rogers has applied to the Missouri Public Service Commission for authority to increase the fares in Joplin, Mo., from 5 cents to 8 cents or two tickets for 15 cents. During the past year under a 5-cent fare the deficit was more than $20,000 it is claimed. Federal Judge Merrill Otis authorized the receivers to ask for a higher fare.

Recent Bus Developments

Bus Operation Planned on Plymouth & Brockton

The Plymouth & Brockton Street Railway, operating a line between these two points in Massachusetts, is planning to abandon service. Parts of the line have been served by buses and it is now the plan to conduct the business in its entirety as a bus proposition. Just as soon as the necessary licenses demanded by bus laws can be secured from the various towns through which the line passes, the change to bus operation will be made.

When the line was built in 1889 it operated a distance of 4½ miles and was known as the Plymouth & Kingston line. Later the name was changed to the Brockton & Plymouth Street Railway and still later became known as the Plymouth & Brockton Street Railway. The line was in financial distress about ten years ago and patrons were called upon to lend their aid.

Bus Permit Denied Olympia Traction Property

The Department of Public Works has denied the application of the Pacific Northwest Traction Company for a certificate to operate motor passenger and express service between Seattle and Everett over the much-coveted new Pacific highway route, and has granted a permit to B. Krakenberger for the service. In refusing the traction company's application, the department said:

> The deduction seems warranted that it has operated its bus service, not for the convenience of the public, but for the convenience and protection of its electric railway.

Both electric railway and motor service, the latter over the old Seattle-Everett Highway, are supplied by the traction company. Citing as proof that the applicant discriminated in favor of the railway, the department said that the train fare between Beverly Park and Everett, a distance of 3 miles, was 10 cents, and the stage fare 20 cents. The company immediately appealed from the order of the department and writ of review and supersedes bond order in the sum of $5,000 were issued by Judge John M. Wilson of the Thurston County Superior Court. The writ is made returnable on Jan. 23.

No Relief for Ohio Commission on Bus Cases

An opinion just handed down by Attorney-General E. C. Turner of Ohio has dealt a blow to the plan to relieve the Public Utilities Commission of Ohio of a vast amount of work in connection with the motor bus franchise and rate cases. The plan had been to use attorney examiners to handle these cases for the Utilities Commission. The Attorney-General in a ruling to the commission says that no money can be authorized for paying for transcribing records in cases investigated by the attorney examiners. There are two possible cures for this situation. There could be action by the emergency board, or by a special session of the State Legislature. Gov. A. V. Donahey has indicated that for the present, at least, he has no intention of calling a special session. Officials are inclined to believe, however, that the emergency board may act.

Emergency Bus Ordinance Authorized in Portland

An emergency ordinance was granted to the Southern Pacific Company by the City Council of Portland, Ore., to operate certain buses which have been substituted for eleven Red Electric trains, formerly used to serve suburban districts. The new ordinance gives the company permission to operate its buses at the Fourth and Stark Street station in the center of the city and to make stops with these buses for picking up and discharging passengers at any other Southern Pacific station in Portland.

Passenger Traffic Gain on New York Suburban Line

Lower commutation rates, the installation of new trains and the establishment of "feeder" motor coach lines contributed to a 12.6 per cent increase in passenger traffic over the New York, Westchester and Boston during the first six months of 1927, as compared with the period in 1926.

Between Jan. 1 and June 30 this year the railway carried 6,301,045 passengers. This represented a gain of 705,090 or 12.6 per cent over the figures reported for the first half of 1926 and marked a new record business for the road. The greatest percentage of gain, 14.29, was registered in the 60-trip commutation class of traffic.

June also set a new record. In carrying 1,106,807 passengers the railroad not only exceeded the million-a-month quota for 1927, but also exceeded by 81,040, or 7.9 per cent, the June, 1926 figure. During June, however, the greatest percentage of increase, 9.84, was in the single-trip class of riders, indicating the growing popularity of the railroad among intracity travelers.

The squadrons of motor coaches recently put into service by the County Transportation Company, a subsidiary of the New York, Westchester & Boston, to replace, in Connecticut and in various sections of Westchester bordering Long Island Sound, the trolleys of the New York & Stamford Railway, another subsidiary, are proving so popular that additional coaches have been ordered for this "feeder" system.

Motor Transport Division for Steam Railroads

Due to the growth and increasing importance of the bus and truck as an adjunct of railroad transportation, a new division of the American Railway Association, known as the Motor Transport Division has been created. Membership in the division will be confined entirely to representatives of the railroads or subsidiaries in the United States, Canada, Mexico and Cuba. Headquarters of the division will be at the offices of the American Railway Association, 30 Vesey Street, New York. A. P. Russell, Boston, vice-president of the New York, New Haven & Hartford Railroad and president of the New England Transportation Company, which operates the buses of the New Haven system, has been appointed temporary chairman. George M. Campbell, New York, assistant to the secretary of the American Railway Association, will be secretary of the division.

The purpose of the organization is to bring together the railroads interested in the development of motor transportation, whether freight or passenger, in order to study the problems arising therefrom, and through the co-ordination of the rail carriers, to devise the most effective means possible for the development of such transportation.

The work of the Motor Transport Division will be divided into three sections, one to the study of the application of the bus to the use of steam railroads, another to the study of the application of the motor truck to the use of steam railroads, and the third to the application of the rail motor car to the use of steam railroads.

The first meeting of the Motor Transport Division will be held in Chicago in January at which time a permanent organization will be perfected and discussed. Its creation is the outgrowth of the Railroad Motor Transport Conference organized in August, 1926, by approximately 50 railroads, which were at that time interested in the development of buses and trucks.

Pittsburgh Bus Route Extended

The present Point Breeze route of the Pittsburgh Motor Coach Company, subsidiary of the Pittsburgh Railways, Pittsburgh, Pa., was extended Dec. 12, 1927, to Penn and Center Avenues, Wilkinsburg, and is known as "Wilkinsburg." Operation of the present Point Breeze route on Dallas Avenue from Penn Avenue and along Thomas Boulevard will be discontinued. The fare will be 25 cents one way with tickets for convenience on sale by the operator at 21 for $5.

Financial and Corporate

Huntington Properties Change Hands

City and interurban lines in West Virginia pass from Appalachian Electric Power to Central Public Service Corporation

ELECTRIC railway properties in Huntington, W. Va., and the urban and the interurban lines between Huntington and Ironton, operated by the Ohio Valley Electric Company, have changed hands. That fact was made known on Dec. 30 by W. R. Power, division manager of the Appalachian Electric Power Company. The trackage totals 54 miles. The deal also includes the Ohio Valley Bus Company.

The transfer was effected through a sale of the stock of the Ohio Valley Electric Railway by the Appalachian to the Central Public Service Corporation, Chicago, of which A. E. Pierce is president. He formerly resided in Huntington while he owned and operated the Huntington Development & Gas Company.

Simultaneous with the Huntington announcement came word that the Chicago corporation had also acquired control of the electric railway systems in Portsmouth, Ohio, and Wildwood, N. J., and the electric company in Rockford, Ill.

Mr. Power was advised of the consummation of the deal in a telegram from George N. Tidd, New York, president of the American Gas & Electric Company, of which the Appalachian Electric Power Company is a subsidiary.

With the sale of its transportation lines, the American company will derive virtually all its gross income in the Huntington section from electric power and light operations. Its electric properties in all cities except Rockford are retained.

It was in 1899 that the historic Consolidated Light & Railway Company, headed by the late J. L. Caldwell, operated the first electric car between Huntington and Guyandotte. This company subsequently built other lines within the city. It remained for the late Johnson N. Camden and his associates to secure control of the various electric railway interests in Huntington, Ashland and Ironton and to link them together in one interurban system under the ownership of the Camden Interstate Railway. Senator Camden completed the last link in his system in 1900.

In 1902 the company was purchased by Colonel John Graham and sometime thereafter the company became the Ohio Valley Electric Railway. Colonel Graham sold the properties in 1907 to W. X. Sproul, afterwards Governor of Pennsylvania, and a group of associates. The Sproul interests sold to the American Railways in 1912.

In the next few years the commercial power business began to loom large and the American Railways became the American Electric Power Company. In 1923 the American Gas & Electric Company became the general holder of large power interests including those in this section now operated by the Appalachian Power Company.

Missouri Utility Stock Sought

The City Utilities Company, St. Louis, Mo., has asked the Missouri Public Service Commission for authority to hold more than 10 per cent of the stock of the St. Louis Public Service Company and of the Kansas City Public Service Company, both of which were reorganized by Newman, Saunders & Company, Inc. A Missouri statute prohibits a foreign corporation from holding more than 10 per cent of the stock of a Missouri public utility without the permission of the state commission. Col. Albert T. Perkins, former general manager of the St. Louis railway system and now vice-president of the City Utilities Company, said the company would hold 40 per cent of the common stock of the St. Louis company and 25 per cent of the Kansas City stock if permitted.

Loss on San Francisco Municipal $240,228

For year ended June 30, 1927, the system sustained this loss after allowing for the deduction of charges comparable to those a private system would have to meet

TOTAL revenue of the Municipal Railway of San Francisco, San Francisco, Cal., for the year ended June 30, 1926, was $3,420,074 against $3,409,965 the year before. Interest on securities owned was $46,641. A consideration of detailed operating expenses shows an increase in every account except one, leaving the total of $2,879,905, or $274,759 greater than in the year 1926.

The report is prepared for and approved by the finance committee of the Board of Supervisors. For the purpose of securing a comparison between the results of operation of the municipally owned utility and similar utilities operated by private capital the charter of the city and county of San Francisco provides that the operating reports should include certain comparison charges consisting of items which constitute part of the actual cost of operating privately owned companies but

COMPARATIVE INCOME ACCOUNT MUNICIPAL RAILWAY OF SAN FRANCISCO

	Year Ended June 30 1926	1927	Dec. 28, 1912 to June 30, 1927
Passenger revenue	$3,395,950	$3,398,187	$35,477,710
Miscellaneous revenue	14,015	21,887	159,373
Total revenue	$3,409,965	$3,420,074	$35,637,083

Free passengers	542,785	0.0576	0.5562
Total passengers carried	83,603,652	8.8672	85.6639

* Includes bus mileage of buses.
† Includes bus hours of buses.
‡ Transfers lifted at Fillmore and Union Streets treated as revenue passengers pending the result of present litigation with the Market Street Railway.

which the municipally owned utility is not required to pay. These charges in 1927 amounted to $318,271, leaving a net loss of $240,228 for the year. The deficit in the cumulative account from Dec. 28, 1912, to June 30, 1927, was $1,885,606.

Items in the balance sheet are listed in detail. Capital assets include road and equipment, $8,636,839, and general expenditures, $324,872, and construction work in progress, $7,422, making the total property investment $8,969,134. Thus the total assets was $11,080,168. The items in the balance sheet were condensed for reproduction in the table that appears elsewhere on this page.

Total bus mileage is 11.89. That of the railway was more than 74 miles.

Under the heading cash and securities with treasurer are grouped cash and securities held by the treasurer of the city and county of San Francisco for and on account of the municipal railway.

Change in Procedure on Accident Prevention Reserves

Funded debt unmatured stood at $3,295,000. This amount represents the par value of unmatured bonds outstanding at June 30, 1927.

Reserve for accidents stood at $116,774, made up as follows:

Accident Reserve Fund:		
Cash with Treasurer	$29,491	
Less: Warrants Payable	8,319	
Available Cash		$21,171
Securities with Treasurer		95,603
Total		$116,774

The accident reserve fund was established by ordinance passed by the Board of Supervisors on April 19, 1926. According to the terms of the ordinance, 2½ per cent of the gross passenger revenue must be set aside for the purpose of paying claims for accidents and damages resulting from the operation of the municipal railway (other than accidents to employees) and expenses incidental thereto such as expenditures of claim and legal departments. During the period under review, the sum of $84,954 was transferred to this fund to take care of the provision which has just been outlined.

Reserve for accrued depreciation of road and equipment stood at $3,834,891. This amount represents the accumulated provision for depreciation of road and equipment as prescribed by ordinances, less charges thereto on account of depreciation previously set up on those assets which have been retired. Ordinance No. 3109 N. S. provided that 18 per cent of the gross passenger revenue should be set aside each year to meet all charges on account of depreciation and to pay the principal of the bonded indebtedness incurred in the construction of the railway. This ordinance was made retroactive to Dec. 28, 1912, and its provisions were compiled with until April 30, 1926, when it was repealed by ordinance No. 7060 N.S. Ordinance No. 7060 N.S. provides that 3 per cent of the cost of road and equipment shall be set aside each year to meet all charges arising on account of depreciation of road and equipment. Thus no uniform annual rates of depreciation based on cost were adopted until April, 1926.

The difference between the balance in this account and the net provision, as disclosed by the table that is contained in the pamphlet report is as follows:

Net provision for depreciation as disclosed by table		$3,917,296
Less: Provision for depreciation applicable to assets retired:		
Fiscal Year ended June 30:		
1921	$2,063.61	
1923	30,650.00	
1924	1,082.50	
1925	4,960.00	
1927	43,649.25	82,405
Balance per books, June 30, 1927		$3,834,891

CONDENSED COMPARATIVE GENERAL BALANCE SHEET MUNICIPAL RAILWAY OF SAN FRANCISCO AS OF JUNE 30, 1927

Assets:	1927	1926

	$5,959,463	$2,042,166	$3,917,296		

Digitized by Google

The charges to the reserve account for property retired, in the sum of $43,649 were computed on the basis of percentages appearing in the foregoing table, irrespective as to classes of assets. This was occasioned by the fact that a property ledger is not maintained but it is explained that if this record is installed, it should furnish a more equitable distribution of charges on account of property retired.

Disposition of Amount Ordinarily Set Up for Taxes

The surplus provision for comparable taxation charges stands at $3,148,672. Chapter 3 of Section 16 of Article XII of the Charter of the city and county of San Francisco provides that the books of account of the municipal railway shall show, in addition to other transactions, estimates of the amount of taxes that would be chargeable against the railway if it were owned by a private corporation. In accordance with the foregoing provision, there has been charged against earnings for the period from Dec. 28, 1912, to June 30, 1927, the following amounts, corresponding to the items that would have been paid if the railway were under private control:

State of California franchise taxes	$1,870,453
Federal income taxes	37,696
City and county of San Francisco franchise taxes	1,201,721
City and county of San Francisco car licenses	38,801
Total	$3,148,672

Since no liability exists for the comparison charges which are shown in the table above the amount has been considered as a portion of the general surplus of the railway.

The results of operations for the period from Dec. 28, 1912, to June 30, 1927, are disclosed on exhibit B, a summary of which is given in the following table:

Net profit from operations after deduction of all charges except those for taxes provided by the Charter of the city and county of San Francisco, which are for comparative purposes only	$2,834,939
Deduct: Charter comparative taxation charges	3,148,672
Deficit after deduction of charter comparative charges	$313,733

The net increase in this account, during the fiscal year under review, in the sum of $240,228, is accounted for as follows:

Net profit from operations for the current fiscal year after deduction of all charges except charter comparative taxation charges	$78,042
Deduct: Charter comparative taxation charges	318,271
Net increase	$240,228

A reconciliation of the deficit account at June 30, 1926, as between exhibit C of the audit report rendered as of that date and the balance appearing on exhibit A of this report for the same date shown in the accompanying table just as presented in the report.

The net surplus amounts to $3,191,492 and the increase in this account during the fiscal year, in the sum of $78,043, represents the net profit for the year after the deduction of all charges except those provided for by the Charter for comparative purposes.

A reconciliation of this account at June 30, 1926, as shown by Exhibit A of the audit report rendered as of that date with the amount shown in Exhibit A of this report for the same date is as follows:

Surplus, June 30, 1926, Exhibit A prior year's audit report		$5,449,649
Surplus, June 30, 1926, Exhibit A this report		3,113,449
Difference (decrease)		$2,336,199
Represented by:		
Portion of reserve for accrued depreciation of road and equipment credited to surplus reducing reserve to an amount corresponding to assets in depreciation funds	$2,273,752	
Reserve for fire insurance credited to surplus	61,920	
Adjustment of demands payable	672	
Total	$2,336,325	
Less excessive accruals of bond interest payable	125	
Net difference		$2,336,199

The certified public accountants who rendered the report say that the records examined by them indicate a satisfactory condition of accounting procedure, personnel and efficiency — a condition that compares very favorably with that found in organizations of privately owned public utilities and other city and county governments heretofore examined by them.

During the progress of their audit, the accountants who were engaged to make the audit installed, as of July 1, 1927, a modern double entry system of accounts to record all transactions of the municipal railway. In addition they established an accounting procedure which should disclose information necessary for the compilation of monthly reports, as prescribed by Ordinance No. 7060 N.S. of the Board of Supervisors under date of April 19, 1926.

Reconciliation of the Deficit Account

Net loss, June 30, 1926, Exhibit C prior year's audit report		$1,645,378
Add items on books not reflected in audit report:		
Reconstruction charges fiscal years 1922–1925	$28,826	
Replacing cables fiscal year 1924–1925	7,351	
Unaccounted for audit report deduction fiscal year 1924–1925	820	36,997
Total		$1,682,376
Deduct items on books not reflected in audit report:		
Compensation insurance refunds fiscal years 1921–1925		136,832
Deficit per books, June 30, 1926		$1,545,544
Add:		
Adjustment of prior year's demands payable	$672	
Payments made on account of injuries and damages and charged on the books to the reserve for depreciation of road and equipment	571,963	572,635
Total		$2,118,179
Deduct:		
Excess accruals of prior years' bond interest charges	$125	
Compensation insurance refunds, etc., prior years	2,383	
Provision for redemption of of funded debt applicable to bonds heretofore matured and redeemed, charged to expense and credited to reserve for depreciation of road and equipment	2,042,166	2,044,675
Adjusted deficit account, June 30, 1926		$73,504
Charges, current fiscal year:		
Net loss for current year after deduction of comparative charges, exhibit C	$236,684	
Uncollectible accounts receivable written off	25,033	
Expense of prior years	244	
Total charges	$261,962	
Credits, current fiscal year:		
Cancellation of prior year's liability	$11.84	
Excess in compensation insurance reserve, abolished June 30, 1927	21,722.46	
Total credits	21,734	
Net increase in deficit account for year		240,228
Deficit from operations, June 30, 1927		$313,733

Explanation of How the Difference Between the Provision for the Redemption of Bonded Debt and the Cash Transferred to the Bond Redemption Fund Is Accounted For

Provision per Table	$2,042,166
Cash Transferred	1,887,000
Difference	$ 155,166

Represented by Bond Redemption Payments made from Operative Fund on following Bond Issues:

Issue	Date Due	Amount
Geary Street Railway	July 1, 1915	$95,000
Market Street Railway	July 1, 1915	6,000
*Municipal Railway	Dec. 1, 1926	54,166
Total		$155,166

* Represents provision for five months from Dec. 1, 1925, to April 30, 1926, the date on which ordinance 3109 N.S. was repealed

New Directors in Springfield

Three new directors were elected recently to the board of the Springfield Street Railway, Springfield, Mass. They are Frederic M. Jones, president of the Third National Bank & Trust Company; Joshua L. Brooks, president of the Brooks Bank Note Company, and Congressman Henry L. Bowles. The additional directors were elected to increase the local representation on the board. This move increases the number from nine to twelve, eight of whom are Springfield residents.

Legal Notes

FEDERAL SUPREME COURT—*Action of City in Prohibiting Operation of Bus Line on Certain Streets Considered.*

The city of Hammond, Ind., passed an ordinance forbidding bus companies from operating over certain routes but permitting certain exceptions. This decision was considered at length in the issue of this paper for Dec. 17, 1927, p. 1129. [The City of Hammond vs. Schappi Bus Line, 48 S.Ct., 67, also a similar case, City of Hammond vs. Farina Bus Line and T. Co., 48 S.Ct. 70.]

FEDERAL SUPREME COURT—*Definition of Common Carrier Given. Such a Carrier Can Be Prevented From Reducing Rates.*

The Department of Public Works of the State of Washington established rates for towing, applying to all common carriers, but one tug boat company charged for its services on a different scale, which was said to be "the same or a little less" than the scheduled rate. It claimed it could establish any rates it wished because it was not a common carrier and that it could not be converted into a common carrier by legislative command. The Supreme Court held, however, that "within settled principles, one who undertakes for hire to transport from place to place the property of others who may choose to employ him is a common carrier," and "a common carrier is such by virtue of his occupation, not by virtue of the responsibilities under which he rests." If the company had not been a common carrier, it could make an arrangement with customers for compensation for its services without regard to the rate established by the Department. [State of Washington ex. rel. Stimson L. Co., vs. Kuykendall et al, 48 S. Ct., 41.]

IOWA—*Injury From Sudden Stop of Car to Avoid Accident.*

A passenger after paying fare and proceeding to a seat was thrown down and injured by a sudden stop of the car. The stop was to avoid a collision with an automobile which negligently got in the way, so that the motorman could not have foreseen the need for the sudden stop. The company was held not responsible, as a matter of law, for the injury to the falling passenger. [Wheeler vs. Des Moines C.R. Co., 215 N W., 950.]

KENTUCKY—*Car Discharges Passengers at Unusual Place Because of Defect.*

A street railway company was justified in stopping a car at a point beyond the usual stopping place when the motor broke down and asking the passengers to alight, since it is lawful to stop a car at any place where necessity and convenience may require. One of the passengers after alighting was struck by an automobile about the time she reached the street. The company was not held responsible since it had no control over the driver of the automobile. [Louisville R. Co. vs. Saxton, 298 S.W., 1105.]

NEW HAMPSHIRE—*Responsibility of Railway Company for Accident to Ferris Wheel in Park.*

A person was injured by the collapse of a Ferris wheel upon which he was riding. The wheel was owned by a concessionaire and was in a street railway park on space leased from a traction company, which owned all of the stock of the street railway operating to the park. The railway had advertised the attractions of the park, including the wheel, on a number of occasions. The court held that while, in most cases, a landlord is not liable to the guests of his tenant for the tenant's negligent maintenance of his leased premises, the situation here was somewhat different because the railway had invited people to patronize the park. This obligated it to use reasonable care to see that the park, including the concessions, was safe for those who had accepted its invitation. The degree of care which it should have exercised was that which was exercised by an average man, rather than that which would have been exercised by a "cautious and prudent man." Hence, an instruction in the trial court that the latter kind of care should have been exercised was held error. [Frear vs. Manchester T. L. & P. Co., 139 A., 86.]

NEW YORK—*Right of Legislature to Regulate Fares.*

Franchises granted by municipal authorities prior to January 1, 1875, when a constitutional article relating to the regulation of fares became effective, are subject to legislative control as to fares, and this control may be exercised through the Public Service Commission. A street railway company was formed by the consolidation of eight companies, seven of which received their franchises prior to the date mentioned. The eighth railroad did not, but as the city consented in 1892 to the electrification of the consolidated lines under a new contract in which no mention of a five cent fare was made, and as other consents were granted by the city to the consolidated company, the inclusion of this eighth line in the consolidation did not pass the control of fares from the legislature (Public Service Commission) to the city authorities. [Evens et al. vs. P. S. Commission et al., 158 N.E., 310.]

OHIO—*Court for Cause Will Reverse Commission's Decision Regarding Cancellation of Transportation Certificate.*

A transportation company charged before the Public Utility Commission that a certain bus operator had violated the orders of the Commission in a number of different ways, such as by operating a larger bus than authorized, failing to pay full license fees, having a defective insurance policy, abandoning part of his route without full authority and conducting some express business without being authorized to do so. A hearing was held by the Commission on the petition to revoke the certificate, but it decided that while there were some irregularities in the operation of the line, they were not so glaring as to warrant the revocation of the defendant's certificate of public convenience and necessity. This decision was appealed to the Supreme Court of the State by the transportation company which brought the original charge. After evidence, the court held the violations constituted good grounds for a revocation of the certificate and the order of the Public Utilities Commission was reversed. [Miami Valley T. Corp., vs. P.U. Commission of Ohio, 158 N.E., 591.]

PENNSYLVANIA—*Cars Must Control Speed at Crossings. Responsibility of Automobile Guest.*

"While trolley cars are not held to the strict rule of control that attaches to a moving automobile at public crossings, they must exercise a certain control to the extent of slackening their speed so as to aid others under stricter control to avoid accidents." An automobile "guest will be held responsible for his action or failure to act in the face of a danger of which he knew, or where it can reasonably be inferred that he must have realized the peril." "Where a guest undertakes to aid in driving a car by observing the condition of the way ahead and surrounding circumstances, he must be held responsible for the result of his own acts." "The guest is responsible for inaction only when he knows of a danger, or where the evidence is such that, from the nature of the situation itself, it appears that he must have realized his peril. He is not required constantly to look out for danger." [Kilpatrick vs. Philadelphia R. T. Co., 138 At., 834.]

TEXAS—*Alleged Negligence of Employee No Defense in Suit Involving Negligence of Employer.*

Under the provisions of article 8306, revised statute of 1925, neither contributory negligence nor negligence of a fellow employee constitutes a defense in the case of damages where specific acts of negligence of employer are proved. [El Paso E. Co. vs. Sawyer, 298 S.W., 267.]

Personal Items

R. A. Leussler Resigns at Omaha

Leaves acting service after 25 years, but remains in advisory capacity. More time to Omaha Steel Works

R. A. LEUSSLER, vice-president and general manager of the Omaha & Council Bluffs Street Railway, Omaha, Neb., has retired from active connection with the company other than as a stockholder and director after 25 years' service. He will remain in an advisory capacity for some time. He is interested in the Omaha Steel Works and will devote much of his time to that business. Mr. Leussler issued the following statement:

Managing a railway is always a strenuous job and during the past decade it has been particularly so. For some years I have wanted to retire from the railway industry entirely but felt it my duty to remain at my post until some pressing problems confronting the company could be solved. With J. N. Shannahan as president, the affairs of the company are now in able hands and I feel the time has arrived when I can, with justice to all interested, retire.

R. A. Leussler

I, therefore, tendered my resignation to take effect at as early a date as convenient and today it was accepted. At Mr. Shannahan's request, however, I have consented to continue in an advisory capacity for some time.

The 25 years of my service with the company have been full of toil and trials and problems, but they have been pleasant years, too. It has been a privilege to work in close contact with Gurdon W. Wattles and a joy to work shoulder to shoulder with W. A. Smith, whose aims have always been the same as my own, namely, to build solidly and well and to give the people the best car service possible. It has been pleasant, too, to have had always the stanch support of the board of directors.

Now, as to my future plans. I am vice-president of Omaha Steel Works and have a substantial interest in that company. While I do not wish to tie myself down again with active duties it will now be possible for me to give a little more attention to that interest than was possible before and to have some time for leisure. Also as a stockholder and director of the railway I will continue to feel a deep interest in the welfare of that company.

President Shannahan said:

I regret Mr. Leussler's decision to retire at this time, but I can quite appreciate the reasons that impel him to this action. He lightens the blow by his generous willingness to act in an advisory capacity for some time to come. His years of service with this company have given him an understanding of its problems that make his advice of the greatest value to me and I am deeply appreciative of the generosity of his offer to help me.

Mr. Leussler acquitted himself well in Omaha under most adverse circumstances. Under adverse conditions the system there has been affording, on the whole, an adequate and satisfactory service to its patrons. As one of the local papers put it, Omaha people who are familiar with railway service in other cities are aware that their own city has little to apologize for, and much upon which to congratulate itself, in this respect. The difficulties are rather with respect to the company's financial condition, due to an expiring franchise and to maturing bonded obligations that can be met only by extensions or refunding. As the Omaha *Bee* expressed it:

Mr. Leussler came to Omaha at a time when the local company was expanding. It was taking over the lines in Council Bluffs and becoming, in effect, an interstate carrier. Also, it was planning certain interurban extensions. He was then secretary of the company, more particularly concerned with its accounts than its operation. Changed conditions eventually thrust him into the active and responsible management of the concern, where he found himself confronted with problems that might perplex anyone.

To keep his line in first-class condition, with patronage sadly diminished, and to meet its financial obligations was the big job this man had to wrestle with. Whatever else Mr. Leussler has done, he has kept the service at a high standard. Mr. Leussler may retire from a difficult situation, conscious of having done his work well. It is good to know that he has other interests in Omaha that will keep him here as a member of the community.

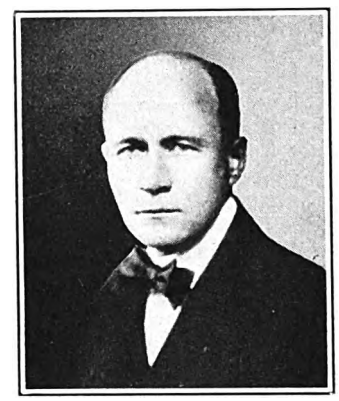
Mr. Leussler joined the company at the time of the consolidation of the Omaha Street Railway, the Metropolitan Cable Railway and the Omaha & Council Bluffs Street Railway & Bridge Company. He served as secretary of the company for five years. Then for five years he acted as assistant general manager. In October, 1919, he was made manager to succeed W. A. Smith.

He entered the electric railway business in 1897 as an employee of the People's Railway, St. Louis, Mo. He left that company to become connected with the St. Louis Transit Company, the operating company of the United Railways, St. Louis. He resigned from the company in St. Louis in 1902 to join the Omaha & Council Bluffs Street Railway.

"Narrow-Gage" Line in Hands of George W. Wells

To George W. Wells will fall the romantic if arduous rôle of handling an important "narrow-gage" railroad soon to be electrified. As vice-president and manager of the Boston, Revere Beach & Lynn Railroad he will have a busy program planning de luxe equipment for the suburbanites, remodeling stations and effecting numerous other improvements included in the prospectus of Hemphill & Wells, an engineering and management organization of New York City, which recently purchased the Massachusetts property.

George Wells has been affiliated with his brother, Gardner Wells, and Albert W. Hemphill in the operation of the Interstate Street Railway, Attleboro, Mass., of which he was local manager until his firm took over the Poughkeepsie & Wappingers Falls Railway property about a year ago. The past year, however, he has divided his time between these two utilities. During the war George Wells was connected with the Transportation Department of the United States Housing Corporation in charge of the work in the East. After the war he spent about two years with the American Electric Railway Association as director of exhibits.



G. W. Wells

His experience and training should fit this railway promoter to fulfill the hopes of the folk of that district who for more than half a century have enjoyed the convenience and advantage of the "narrow-gage," which grew from humble beginnings to a utility owning 26 locomotives and four big modern ferry boats. He received his early training in the General Electric Company, serving first in the construction end and later in the commercial department. For a number of years he was associated with the West Penn Railways at Connellsville, Pa., and spent about five years with Stone & Webster as manager of the Tampa Electric Company.

The combination of Gardner F. Wells as president and George W. Wells as vice-president and general manager portends fast and attractive service and a continuation of the dividend-paying habit, never broken on this utility.

George Frey Now Brill General Sales Manager

George Frey, who has been assistant general sales manager of the J. G. Brill Company for the past two years, was promoted to general sales manager on Jan. 1. He will continue to supervise the Brill sales organization, which he has done since his appointment as assistant general sales manager, announced in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 7, 1925.

Mr. Frey's affiliation with the Brill organization dates back to July 28, 1914, when he started in the estimating and labor departments. Ten years prior to that he had entered the electric railway field, when, at the age of fifteen years, he got a job in the armature repair shop of the Cincinnati Traction Company. This was the beginning of an experience and training in both the operating and manufacturing ends of the business which has resulted in a broader knowledge of the industry's problems and a better understanding of their solution. His experience includes practical shop work, details of development and design, estimating, service as an executive assistant and selling.

After successively serving in various capacities with marked distinction Mr. Frey was placed in charge of the Brill Southern sales division in October, 1919. Due to his wide practical engineering experience, combined with a forceful and pleasing personality, he was particularly successful in this capacity and obtained results which were responsible for his promotion to the leadership of the Brill sales organization.

John J. Esch Gets Recess Appointment

As a result of the Senate's failure to act upon his renomination, John J. Esch of Wisconsin, chairman of the Interstate Commerce Commission during 1927, automatically went out of office on Dec. 31, but on Jan. 3 President Coolidge reappointed him to act during the recess of Congress over the holidays and until that body can pass upon him.

Mr. Esch, who as a member of the House of Representatives was co-author of the transportation act, was reappointed recently by President Coolidge on the expiration of his first term as a commissioner. The Senate Interstate Commerce Committee, on motion of Senator Wheeler, Democrat, of Montana, postponed a vote on the confirmation, however, and Congress recessed for the holidays.

The chairmanship of the commission under its rules passes to another member with the new year, and Commissioner J. B. Campbell of Washington has been designated for the post by his associates.

The commission is threatened with another vacancy in its membership. Henry Hall of Colorado for some weeks has had in President Coolidge's hands a resignation intended to take effect whenever the President was ready to name a successor.

Among those mentioned for the place are Victor E. Wilson, former member of the Nebraska State Railroad Commission; Claude Porter of Des Moines, a former member of Congress, and P. J. Farrell, now solicitor of the commission.

C. E. Myers and G. T. Atkinson in Philadelphia

Aids were recently announced by Mayor Mackey of Philadelphia, Pa., for the administration of city affairs during the next four years. Clarence E. Myers was chosen director of the Department of City Transit and George T. Atkinson assistant director.

Mr. Myers was connected with the Pennsylvania State Highway Department in various engineering capacities from 1911 to 1921. Prior to 1911 he was affiliated with electric railways in western Pennsylvania. During the war he was a captain and later a major of engineers in America and France. Since 1921 he has been construction engineer and deputy chief of the Bureau of Highways. Early in his career Mr. Myers was an instructor in civil engineering and military science at the Pennsylvania Military College, from which institution he was graduated in 1909 as a civil engineer, and returning for post-graduate work years later received the degree of master of civil engineering in 1926. Mr. Myers was born in McKeesport 40 years ago.

His assistant, George T. Atkinson, is recognized as an authority on transit affairs. In 1888 Mr. Atkinson entered the steam railway service and had eight years' experience in construction and operation with the Louisville & Nashville Railroad. From 1897 to 1909 he was engaged in electric railway construction, operation, management and accounting. Later he became a member of the staff of Ford, Bacon & Davis, consulting engineers, making investigations and reporting on contemplated electric railway systems in various cities throughout the country. His work included the traffic survey and recommended system of rapid transit development published in the report of the Transit Commissioner of Philadelphia under date of July, 1913. He was appointed assistant director of the Department of City Transit in 1915. Mr. Atkinson was born at Carrollton, Ohio, in 1871.

Changes in Minnesota Commission Staff

Frank W. Matson, junior member of the Minnesota Railroad and Warehouse Commission, will succeed Ivan Bowen, retiring member, in the railway, bus and truck division.

C. J. Laurisch of Mankato, the new member, takes up Mr. Matson's former work relating to grade crossings and other activities.

J. C. Guild, Jr., Succeeds the Late B. C. Edgar

Jo Conn Guild, Jr., has been appointed general manager of the Tennessee Electric Power Company, Chattanooga, Tenn., succeeding the late B. C. Edgar. In addition he is vice-president of the company. Mr. Guild is a son of the late Jo Guild, widely known throughout the South in the engineering field and a pioneer in power development in that section.

JAMES C. BENNETT, comptroller and secretary of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has been elected vice-president to have charge of the accounting and treasury departments. The oldest Westinghouse employee began service with that concern in 1886, five months after its formation. His first position was assistant to the auditor, and for some time he was the only assistant the auditor had. Later he was elected auditor. In 1909 the office of comptroller was created for him and a few years later he became secretary. He is a director of the parent company and several subsidiaries.

OBITUARY

Samuel Lewis Shank

The death in 1927 of Samuel Lewis Shank, twice Mayor of Indianapolis, Ind., removes a picturesque and active opponent the state has had to the Indiana Public Service Commission and the regulatory system of public utility control. Always pronounced in his views against state control of utilities, he attracted attention to himself when, as Mayor, he headed a big parade to the State House and demanded the Governor discharge the members of the commission. In a truck heading the parade was a monster signed petition. The Governor paid no attention to the demand. Without the backing of any organization and relying on his own personality, he ran second for Governor among three or four candidates.

G. DANA EMERSON, who died in 1927, was former subway engineer for the city of Boston, Mass. He left Boston about nine years ago. He was engaged by the Boston Transit Commission, the predecessor of the present Boston Transit Board, under Chief Engineer Howard A. Carson, to work on subway plans. He was an associate of Edmund Davis, an assistant to Mr. Carson. The commission was then planning the Boylston Street subway, the Fort Point Channel and Cambridge tunnel subways. He served on the Transit Commission eighteen years and took an important part in the engineering plans in connection with the building of the Washington Street tunnel as well as the Cambridge and Boylston Street tunnels.

Manufactures *and the* Markets

$10,000,000 Expansion in Texas Utility Companies

The Texas group of public utility companies under Stone & Webster management, namely, the operating subsidiaries of Eastern Texas Electric Company (Delaware), El Paso Electric Company, Galveston-Houston Electric Company and Northern Texas Electric Company, have arranged for spending approximately $10,000,000 in the next year on improvements and general expansion. A considerable portion of this amount will be used on the railway systems in Fort Worth, El Paso, Galveston and Houston. The Houston transportation system has already invested $340,000 in twenty new cars, and among other expenditures will use about $175,000 to purchase fifteen new buses to establish express bus service from Houston to Harrisburg. It is expected that this service will be started within the next few weeks.

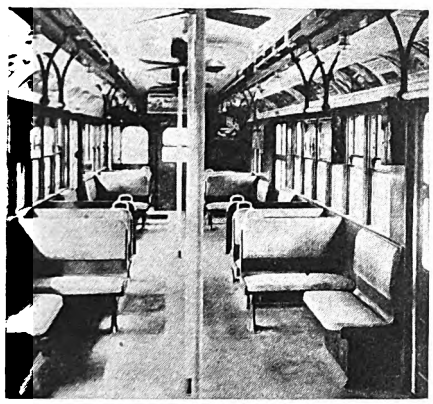
About $3,000,000 of the $10,000,000 appropriation will be spent for construction of power facilities at the Neches station near Beaumont, Tex. Here the Gulf States Utilities Company, a subsidiary of the Eastern Texas Electric Company (Delaware), is constructing an additional unit of 47,000 hp. capacity. The first unit, with a capacity of 40,000 hp., was installed only a little more than a year ago, but the rapid increase in the demand for electricity in the territory served, which is supplied through a network of high-tension transmission lines extending more than 200 miles along the Gulf Coast, so the managements feel, warrants the construction of this second unit, which will more than double the present generating capacity of the Neches power station.

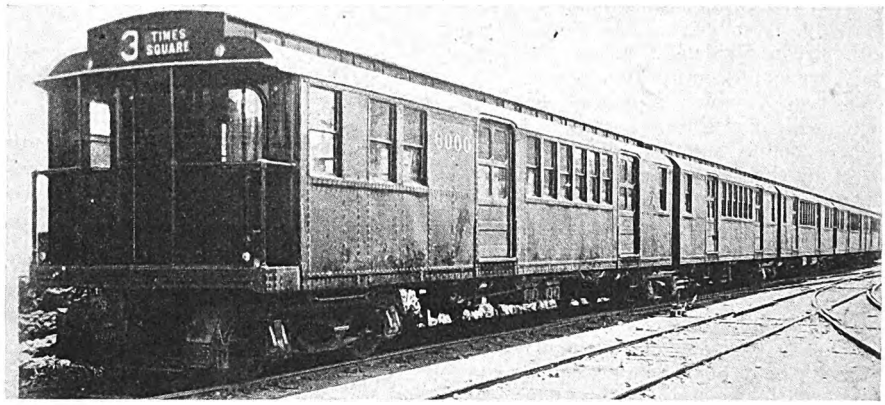
Interborough Not Infringing Car Door Patent

A suit for infringement of patent 1379583, brought by S. P. Walkup against the Interborough Rapid Transit Company, was decided in favor of the defendant in the Circuit Court of Appeals, Second Circuit. The case had been appealed from the District Court of the Seventh District of New York.

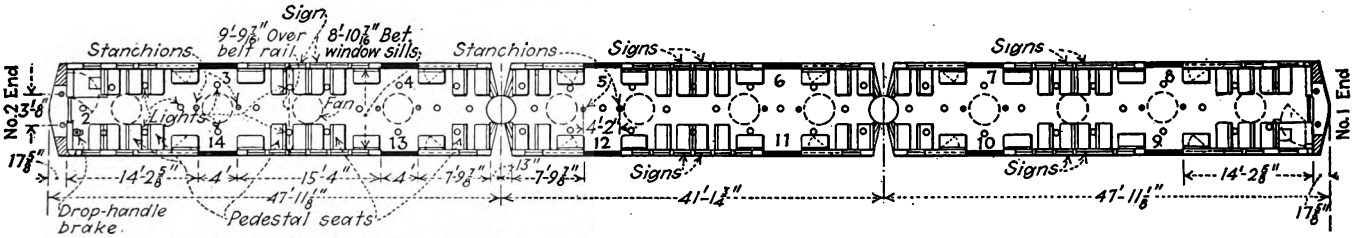
The decision says that the claims in the orginal patent indicate the inventor expected that the door control system would be actuated from contacts made at the station and from power from a

Details of Fifty Triplex Car Units for New York Rapid Transit





The new triplex cars of the New York Rapid Transit Corporation will be similar to those built on a previous order, which are shown in the illustrations. The view at the left was taken in one of the end sections of the unit looking from the connecting drum



The seating plan of the 50 triplex car units recently ordered by the New York Rapid Transit Corporation will be similar to the above plan of one of the 67 previously ordered

Specifications have recently been released for the 50 triplex car units—equal to 150 single cars—which were ordered Nov. 19 from the Pressed Steel Car Company by the New York Rapid Transit Corporation. Mention of the order for these car units being placed by the Brooklyn-Manhattan Transit Corporation, the controlling company, was noted in the JOURNAL for Nov. 26. The cars will have an over-all length of 137 ft., a total weight of 207,190 lb. and a seating capacity for 160 passengers. They are of all-steel construction. Subjoined are the specifications as released:

Number of units	50
Type of unit	Articulated, motor, passenger, city
Number of seats	160
Builder of car body	Pressed Steel Car Co., Pittsburgh, Pa.
Date of order	Nov. 19, 1927
Total weight	207,190 lb.
Length over all	137 ft. 0 in.
Length over body posts	41 ft. 1½ in.
Truck wheelbase	47 ft. 11½ in.
Height, rail to trolley base	12 ft. 1 ⅛ in.
Body	All Steel
Air brakes	Westinghouse A.M.U.E. variable load, plain
Armature bearings	General Electric
Axles	5½x9 quenched and tempered carbon steel
Car signal system	Faraday buzzers
Compressors	Westinghouse D-3-F
Conduit	Sheraduct, metal
Control	General Electric type PC 15-B
Couplers	Westinghouse H-2-A
Destination signs	Hunter Illuminated
Door mechanism	Consolidated
Doors	Morton Manufacturing, sliding
Energy-saving device	Power-on time recorder
Finish (paint)	DuPont, Devoe & Reynolds
Floor covering	Flexolith
Gears and pinions	General Electric and Westinghouse
Glass	Pittsburgh Plate Glass Co.
Hand brakes	Blackall ratchet staff and Peacock gear
Hand straps	Enamel hand rail (Elleon)
Heat insulating material	"Resisto" ½ in.
Heaters	Incloeed element type
Headlining	Agasote
Interior trim	Steel
Journal bearings	Plain
Journal boxes	McCord
Lamp fixtures	Aero metal
Motors	Four General Electric 282-B, inside hung
Roof type	Monitor
Roof material	Copper bearing steel
Sash fixtures	O. M. Edwards
Seats	Cross and longitudinal
Seating material	Rattan
Slack adjusters	Body, Westinghouse; truck, Smith-Ward
Step treads	Feralun
Trucks	Pressed Steel Car Co.
Ventilators	Shutter type
Wheels, type	Rolled steel, diameter 31 in. and 34½ in

Digitized by Google

battery or other source of power outside the train. This idea was held not to include the system used by defendant in which the train circuit is used in the door control system.

Harvey Hubbell, Jr., Heads Company His Father Founded

Harvey Hubbell, Jr., was elected president and treasurer of Harvey Hubbell, Inc., Bridgeport, Conn., at a meeting of the board of directors held Dec. 27, 1927. He succeeds his father, the late Harvey Hubbell, whose death was mentioned in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 24. Harvey Hubbell, Jr., was associated with his father in the management of the business. No changes in the established policies of the company are contemplated.

Rehabilitation Program in Worcester Shows Results

The Worcester Consolidated Street Railway, Worcester, Mass., will not authorize a dividend this year, but officials are confident of the future. The 1927 report, which will soon be complete, will, it is believed, show a loss in gross revenue, but this will probably be offset by the reduced operating costs.

More than $1,250,000 has been spent in Worcester during the year, in the rehabilitation of the road as promised to the city when it consented to permit the New York, New Haven & Hartford Railroad to resume control of the franchise. The major promise was the purchase of 50 new cars. These are now in service. A new carhouse and a garage have been built at the Grove Street plant and are now in use. In addition tracks in many parts of the city have been relocated, others replaced and roadbeds have been improved.

It is said that the substitution of bus service for trolleys in many places in Worcester County by the Consolidated has reduced operating costs. Railway service to Fitchburg, Southbridge, Springfield, Webster, the Blackstone Valley, Marlboro, Clinton and Leominster has been discontinued and replaced with bus service. In the city of Worcester bus lines have been instituted on the Edgemere and Tatnuck-Dawson road routes and the company is committing itself to an extensive bus system.

The accomplishment in roadbed improvement and similar work has been most impressive. Howard R. Whitney, president of the company, said:

While the return on our investment in Worcester is not at present seen, there is every indication that we will realize on it in 1928. It should be remembered that we spent this large sum of money this year and it would be impossible to produce definite evidence of a return. However, our most recent reports indicate that our railway passenger business is increasing, due to some extent to our new rolling stock.

The new plan of bus service is proving satisfactory. The bus business, of course, during the summer months was bad because so many people used their private automobiles. During the winter bus service increases steadily. I believe that we will show a profit for our bus for the year despite our expenditures for a new garage and new equipment.

There are 230 closed cars on the 114 miles of track operated by the company in Worcester in addition to 50 open cars. To supplement the railway service there are 52 motor coaches.

Will Award $100 for Best Leather Slogan

The executive committee of American Leather Producers, Inc., has authorized an award of $100 to the individual, irrespective of his business affiliations, who will submit, prior to Jan. 15, 1928, a slogan that in the opinion of the committee is of sufficient merit to be used by the leather industry as a whole. Desirable qualities in the slogan wanted are forcefulness, brevity and simplicity. It must also be comprehensive, to include all types of leather.

Prices Stiffen on Copper; Lead and Zinc Steady

Markets for the non-ferrous metals have been very quiet during the week ended Jan. 4. Copper, however, has shown quotational strength and is virtually established at 14.125 cents delivered. Lead is unchanged in New York and slightly firmer in St. Louis, whereas zinc is, if anything, a shade weaker. Tin prices are off a fraction of a cent in the domestic market.

During the week copper has sold at prices ranging from 14 cents to 14.125 cents, Connecticut Valley basis, though but one small sale at 14 cents has been made since Dec. 31. Since then the bulk of the metal has brought 14.125 cents. A big tonnage brought 14.25 cents for delivery in the Middle West Jan. 4. Copper Exporters, Inc., have maintained their price at 14.50 cents c.i.f. The f.a.s. market has been good at 14.25 cents.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Jan. 3, 1928
Copper, electrolytic, cents per lb.	13.862
Copper wire, cents per lb.	15.75–16.00
Lead, cents per lb.	6.50
Zinc, cents per lb.	5.987
Tin, Straits, cents per lb.	57.75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	.....
Somerset mine run, Boston, net tons	.....
Pittsburgh mine run, Pittsburgh, net tons	.....
Franklin, Ill., screenings, Chicago, net tons	1.55
Central, Ill., screenings, Chicago, net tons	1.50
Kansas screenings, Kansas City, net tons	2.175
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	5.50
Weatherproof wire base, N.Y., cents per lb.	16.50
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.6
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal.	0.65

The New York price for lead continues unchanged at 6½ cents, the contract price of the American Smelting & Refining Company. In the Middle West there is a slight disposition to quote higher prices than 6.30 cents, St. Louis.

Zinc prices have ranged from 5.625 cents to 5.675 cents, the higher figure covering metal for forward delivery.

Forward tin has ruled about one-eighth cent less than prompt. Prices on the 99 per cent grade have recently been only nominal.

SHOPS AND BUILDINGS

PHILADELPHIA RAPID TRANSIT COMPANY, it is reported, will shortly build in the neighborhood of Front Street and Green Lane, a new shop and maintenance building at an approximate cost of $2,000,000.

TRADE NOTES

OHIO BRASS COMPANY, Mansfield, Ohio, announces the opening of an office at 721 Healy Building, Atlanta, Ga. H. W. Kilkenny, representative of the company for the past four years with sales headquarters in the Pittsburgh district, has transferred his activities for his company to the St. Louis district. S. W. Walworth succeeds him in the Pittsburgh territory.

WHITE MOTOR COMPANY, through its president, Walter C. White, has announced the promotion of George W. Smith, Jr., formerly technical assistant to the vice-president and general manager of the company, to the position of works manager. Mr. Smith succeeds R. M. Hidey, resigned.

R. C. JENKINS has joined the forces of the Shuler Axle Company at Louisville, Ky., in the capacity of special representative.

ROLLWAY BEARING COMPANY, INC., Syracuse, N. Y., recently announced that it had opened a sales office at 614 Empire Building, Pittsburgh, Pa. Samuel Farrell, who has been affiliated with the Rollway Bearing Company, Inc., for a number of years, with headquarters at Youngstown, Ohio, is in charge of the above office.

ADVERTISING LITERATURE

CROUSE-HINDS COMPANY, Syracuse, N. Y., has issued a folder containing suggestions for floodlighting. Seventeen illustrations increase attractiveness of the folder.

OHIO BRASS COMPANY, Mansfield, Ohio, has issued a folder describing its OB splicers. Various types of splicers are shown in the illustrations. The number of the folder is 150-B.

Volume 71 New York, Saturday, January 14, 1928 *Number 2*

Persistent Improvement

Is the Price of Success

ANOTHER year of readjustment has just closed for electric railways. Much progress has been made in meeting changed conditions by revamping and readjusting outworn methods and facilities. But in no instance have all the possibilities for improvement been exhausted. Those managements which have gone forward courageously have made the greatest progress. They see the most work still to be done and express the most optimistic outlook for the future.

Despite the interest taken throughout the country in improving the character of cars operated by electric railways, actual buying of new cars has lagged. Development in design, on the other hand, has attracted widespread attention. At the Cleveland convention it was clearly manifest that the industry became thoroughly aroused during 1927 to the importance of developing cars that can compete successfully with the automobile. The exhibits included many body, truck and equipment ideas that represented long steps forward in a single year. It seems evident, therefore, that the number of new cars built in 1928 will probably depend to a considerable extent on the speed with which the development work is carried to fruition and the degree of success achieved by some of the newer types of design. If these designs are successful in meeting the competition of the automobile, this may be expected not only to release pending orders for new cars, but also to interest many properties which still are inclined to cling to obsolete equipment.

TRACK reconstruction was unusually active during 1927. This was a continuation of the increased activity shown in 1926. Electric railways have come to see that they face the alternative of putting track in first-class operating condition or, if the density of traffic does not justify the expenditure for track reconstruction work, of abandoning it altogether and substituting buses. The mere fact of the widespread investment which is being made in track reconstruction is ample evidence of confidence in the future of rail transportation.

BUS operation by electric railways is expanding steadily, though undergoing some readjustment and experimentation to determine the proper relation between the new vehicle and existing transportation lines. That relation rapidly is becoming clearer, with marked trends toward certain types of vehicles and classes of operations. A sharper line is being drawn between the operation of buses as street cars on rubber tires; that is, as substitutes for cars, as feeders, cross-town connections or extensions, and the use of buses to give service of a class distinctly different from that of the low-priced rail ride. All signs indicate that bus operation by electric railways may be expected to maintain a healthy rate of increase.

As the industry faces a new year, the general question of the moment again is, "What does the future hold in store?" There is less of desperate demand in the question today than at any other time during the past several years. No longer is the issue one of life and death for the industry. Assured of the fundamental need for public transportation, electric railways can contemplate the future with confidence. But though the outlook has improved, to be content merely to drift into the future would be the height of folly. Real progress is achieved only by keeping a sharp lookout. The opportunity exists for winning greater success than ever—but only by persisting in the application of initiative and ingenuity to meet changed conditions.

Track Reconstruction in 1927 Largest in Many Years

CONFIDENCE in the future of electric railway transportation is indicated by the record-breaking amount of track reconstruction during 1927. Approximately 900 miles of track was rebuilt, of which 700 miles was city track and 200 miles was interurban. This total exceeded the 1926 figure by about 100 miles and topped the previous high record of 1923 by approximately 50 miles. It is about 60 per cent above the average of the past ten years. Activity in city track construction accounts for the increase. The mileage of interurban track rebuilt was substantially the same as in 1926 and well above the average of recent years.

Track extensions made during the year just ended, including steam railroad electrifications, totaled slightly more than 330 miles, or considerably less than those made in 1926. This is a little below the average for recent years. It is noteworthy, however, that electric railway track additions made since Jan. 1, 1917, total more than 4,000 miles. Since more than 3,000 miles of bus routes were added by electric railways during the past twelve months, it seems natural that only a moderate amount of new track is being built.

Ten electric railways ceased operation altogether during 1927. Of this number six were local lines, averaging about 7 miles in length, and four were interurbans, with an average of about 30 miles of track apiece. Bus service was substituted under the same management in two instances and under different management in five instances. No transportation is now being furnished in the territory formerly served by the other three railways. On railways which continued to operate the major portions of their systems buses replaced some 450 miles of car service in 1927. The amount of this replacement was considerably larger than in 1926. Nevertheless, the combined total of partial and entire abandonments in 1927 represented only a little over 1 per cent of the track mileage of the industry. It should be remembered, too, that this was largely offset by the additions to electrified mileage.

Summarizing the gains and losses in the past decade, it is found that the total additions are substantially greater than the total abandonments. Moreover, some 19,000 miles of bus routes have been added during this period, so that the present combined track and bus mileage is far in excess of the pre-war mileage.

Bus Operation Expanding Along Sound Lines

STEADY increase in the bus operations of electric railways occurred during the past year. The rate of growth was approximately the same as in 1926. The number of buses increased about 20 per cent, as did the route mileage. The number of bus-operating railways also showed a substantial increase. Purchases of buses were only a little less than in the preceding year. From this it is evident that a healthy condition exists and that the expansion of electric railway bus operations is steady and sound.

Several significant developments in bus design occurred last year. Foremost among these was the trend toward smaller, lighter and more luxurious vehicles, approaching the private automobile in the character of service rendered. The number of de luxe buses bought was larger than in previous years, and the average seating capacity was somewhat lower. It was notable that companies which had previously started de luxe service at a higher fare purchased more vehicles to extend this service.

On the other hand, new single-deck designs were brought out last year with unusually large seating capacity. Purchases of this type of equipment, while not in large volume, were scattered over a number of properties. That large seating capacity alone is not the only requirement for successful bus operation is indicated by the waning popularity of double-deck buses. The number bought in 1927 was less than for several years past. Judging from this it appears that the general trend is toward the operation of smaller high-grade vehicles suitable for giving a preferred type of service at substantially higher rates of fare.

The extent to which bus service replaced rail service in 1927 was somewhat greater than in 1926. The mileage of such replacements, however, was only one-fifth of the total mileage of bus route extensions. Thus it is again shown that the bus finds its greatest usefulness as an additional and supplemental part of the local transportation systems.

The Need for Ignoring Tradition Is Greater Than Ever Before

EVIDENCE is available on all sides of the progress which the electric railways are making. It is no small accomplishment to have secured fare readjustments that have put much of the nation's mileage on a 10-cent fare basis, to have brought about co-ordination of buses on the present scale, to have secured widespread recognition by a former monopoly business of the need for merchandising and modernizing, to have obtained passage of paving relief measures and to have done the other things of which there is record.

Properties like those of Chicago, Pittsburgh, Atlanta, Richmond and Grand Rapids and some of the revamped interurbans, where it was necessary to resort to physical and financial rehabilitation, are doing well, but the full effect of the heroic changes to which many roads have resorted has only begun to be reaped.

Certainly the situation with respect to receiverships has been materially bettered. The Chicago Railways is the only large city system under the jurisdiction of the court. This is attributable entirely to delay in working out a satisfactory franchise. Although the principal of the bonds is in default, interest is being paid and there is no complaint on the score of earnings of the property. The total amount of bonds in default for the industry still looms large, but there is a strong current of underlying improvement in conditions and the capitalization of property after property is being brought to a sound earning basis. So far as the interurbans are concerned only two large properties of this kind remain under court jurisdiction.

Individual properties have been slow to take advantage of the recommendations of the finance committee of 1925, which suggested voluntary readjustment of finances. But that matter is a live topic again. Voluntary readjustment looking toward the scaling down of fixed charges on existing securities is a process that is not easy of accomplishment, but it offers attractive possibilities to the owners of existing securities for enhancement in the value of their investment through permitting the property to finance needed improvements on reasonable terms. The Grand Rapids Railway was able

Digitized by Google

to simplify its financial structure, and the Pittsburgh Railways is still at work on the effort to consolidate the debts of the companies which go to make up that system. At least one other readjustment of large proportions is under way, but the matter is not far enough along to refer to it specifically.

The present is a particularly propitious time for financial housecleaning since money rates are very low. That the railways which borrowed this year did so at rates advantageous to themselves is attested by the record of financing elsewhere in this issue. The operation of the Twin City Rapid Transit Company in arranging a loan of $18,000,000, secured by a lien under which bonds were sold to yield investors 5.70 per cent, is an instance of a strong company which took advantage of a favorable money market to provide for its future cash needs and to anticipate obligations that do not mature for some months. But it is the small and medium sized companies that need particularly to be nurtured. Something may come of discussions which look toward a plan to make new equipment available to them under a car trust.

An industry has won half the battle which has diagnosed its problems as clearly as have the electric railways, but the need for keeping everlastingly at the work in hand is more insistent than ever. The electric railways will achieve their ends only as they are actuated by the determination to meet changed conditions for which there seems to be no parallel in industrial history. It is difficult to break down the barriers of the past, but the need is greater than ever for ignoring tradition.

Budgets for 1928 Show Confidence

CONTINUED faith in the local transportation industry is shown by the budgets prepared by the various companies for the present year as compared with those of a year ago. Large expenditures are planned for capital account in 1928. It is significant that the biggest increase is for way and structures, indicating that those who control the properties are satisfied that rail transportation will continue for a great many years. Country-wide estimates indicate that the electric railway companies will spend $246,142,000 for new plant and equipment and maintenance materials during the year. This is greater than the amount spent in 1926 or 1927 for similar items. Contrasted with last year, it is 9.27 per cent higher.

Capital expenditures for track are estimated at $89,677,000, which is by far the largest amount estimated since this paper has been presenting budget figures for the industry. Compared with the average expenditures for 1924, 1925 and 1926, it is 70 per cent greater. This is the more remarkable since the money spent on track reconstruction in 1927 was almost 50 per cent more than the three-year average. It is an indication that there is little further tendency to defer trackwork because some other mode may render rail transportation obsolete. Proposed expenditures for cars, $35,495,000, are slightly greater than for 1927. This is considerably less than the average of the years 1924-26. Indicated bus purchases are also slightly higher than for 1927, although the size of the market for buses has changed but little for the past four years.

Purchases of maintenance materials planned for this year show an increase in all items. While these are not large, there is every indication that the industry is preparing to take good care of its physical plant. In particular, the larger amounts spent for bus maintenance last year and the estimated expenditures for this year indicate that since equipment of this type is all relatively new, and more and more buses are being added each year, the maximum of bus maintenance costs has not yet been reached.

The careful preparation by the companies of the figures from which these industry estimates were calculated shows increased interest by operators in annual industry budgets published by the JOURNAL. It also shows that electric railways are giving more attention to plans for the future. But it is far more significant that the actual figures for planned expenditures indicate a growing confidence in the stability of the industry and in the continued need for efficient local transportation.

Car Situation Demands Earnest Attention

WHEN analyzed from the standpoint of new rolling stock purchases, the year 1927 was a period of waiting. The value of speed, beauty, style and quiet operation of electric cars for stimulating increased riding was recognized in 1926 and substantial progress was made toward perfecting designs that would have increased rider appeal. Further refinements in car body construction and several radical changes in truck design were brought out at the beginning of 1927. These have undoubtedly had the effect of delaying purchases of needed rolling stock pending further experience with the experimental designs.

This delayed buying of cars cannot long continue. The industry must proceed with the replacement of obsolete equipment to meet the changed conditions of the day and to eliminate the excessive operating cost of old cars. Then there may be expected not only the active business of a normal year but also the increase due to the deficiency in car replacements during the past several years.

The number of passenger cars, 945, bought by electric railways during 1927 was the lowest for any single year in the records of the industry. In 1921, which previously was the low year, there were 1,188 passenger cars purchased. The total of all types of cars and electric locomotives for 1927 was brought above that for 1921 by the increased number of freight and dump cars bought. New city passenger cars in 1927 were 22 per cent less than for 1925 and 34 per cent less than for 1926. Interurban passenger cars bought in 1927 were 62 per cent less than in 1925 and 60 per cent less than in 1926.

Cars of the two-man type predominated in the orders for large cities. There were, however, 410 one-man or one-man, two-man cars reported. This constitutes 45.9 per cent of all the cars ordered for city service. Reduced weight was sought in every way possible. Several experimental cars were built in which aluminum was used largely in the construction, and light weight was a controlling feature in all the new truck designs. Low floor heights with small wheels and four-motor equipments were the rule for new city cars.

It is quite obvious that the entire car situation constitutes a problem of major importance. It is of gravest consequence to the industry and deserves the earnest attention both of operating and manufacturing executives. The primary motive back of all the new designs is to develop cars that will attract increased revenue. Manufacturers are therefore entitled to the fullest possible co-operation from the industry in this effort. Only with such co-operation may they be expected to carry through successfully this expensive development work.

Railway Operations Show Basic Improvement

Stabilization has followed the economic upset caused by the war, and improvement can be looked for in 1928. Industry statistics cover trends of revenues and expenses, as well as comparisons with other indices of business

VITAL changes that affect the electric railway industry have been under way ever since the beginning of the war. In fact, some of them had their inception before that time, although they had not become of great moment until the entire economic structure of the country was upset. However, at no time since this period of readjustment began have conditions been so thoroughly stabilized as during the past year. The industry has now adapted itself to the changed conditions and it is not to be anticipated that there will be any periods of doubt and uncertainty in the near future such as existed in the era the country has passed through.

Two major factors have exerted a profound influence on the local transportation industry. The first of these is the tremendous increase in costs of every kind, while the second is the advent of the passenger automobile as an active competitor. Other factors that have had a lesser influence are the general prosperity of the country and the trend of industrial employment.

The effects of these influences may be seen by a study of the charts accompanying this article. These were prepared originally by the American Electric Railway Association's statistical department, and were exhibited at the Cleveland convention last October. In co-operation with the association, these have been extended to include the latest available figures, so that the trends may be seen almost to the end of 1927.

Passenger Traffic and Industrial Employment

Trends of passenger traffic and employment for the last three years are shown graphically in Chart I. The earlier portion of the chart is computed for 201 electric railway companies, while for the last five months of 1927 the number of companies varies somewhat, as slightly fewer of them turned in complete reports. The 201 companies operate 26,215 miles of single track and 6,277 miles of bus routes. The track represents 62 per cent of the total electric railway mileage in the country.

Frequently the assumption is made that the passenger traffic of local transportation systems follows the trend of industrial employment. In previous years this may have been true to a considerable extent. As seen in Chart I the peaks and valleys of employment in the earlier months have corresponded rather closely to the riding, although the summer drop in employment is considerably less pronounced than that in traffic.

General business conditions were somewhat less stable in 1927 than they were in 1926. The difference is evidenced in the reduced employment index for the past year, which was lower than for 1926 and also lower than for 1925, which was not so good a year as 1926. It is

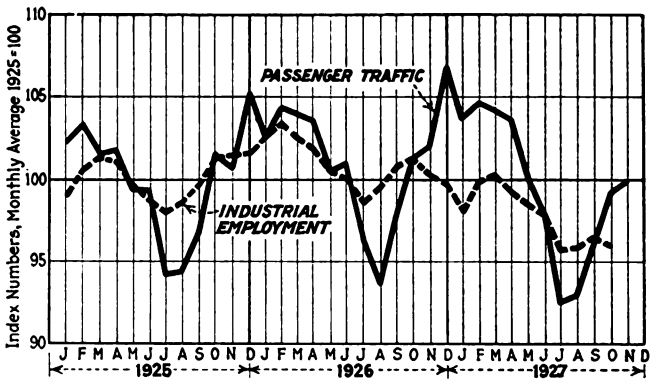

Chart I—Trend of passenger traffic and industrial employment for the years 1925, 1926 and 1927

The trend of passenger traffic was greater for the first quarter of 1927 than in 1926. Beginning in April, the index declined, but in August it again began to rise. The information was obtained by the American Electric Railway Association and the U. S. Bureau of Labor Statistics.

an encouraging sign to note that the riding during November and December, 1926, and in the first months of 1927 actually showed an increase, even though there was a drop in employment. Somewhat later in the year traffic fell off, but as the season advanced traffic has shown indications of coming back to normal, though employment continued to have a downward trend.

Many years ago the electric railways did their maximum business in the summer months. This was to a

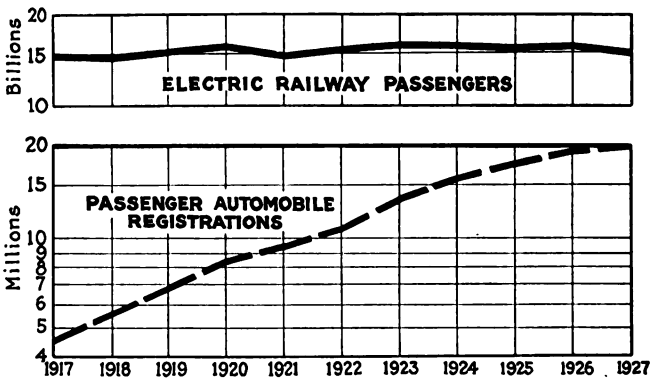

Chart II—Trends of electric railway traffic and passenger automobile registration during the past eleven years

Figures collected by the American Electric Railway Association and the National Automobile Chamber of Commerce show that though automobile registrations have experienced an enormous growth in the past decade they have not materially affected electric railway passenger traffic.

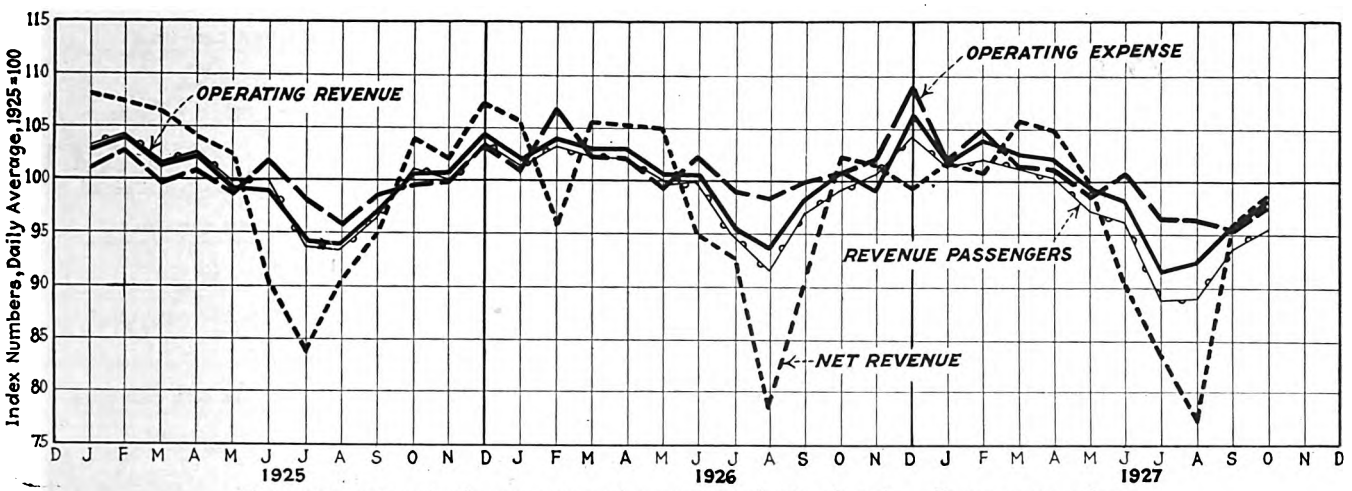

Chart III—Trend of revenues and expenses of 134 electric railway companies

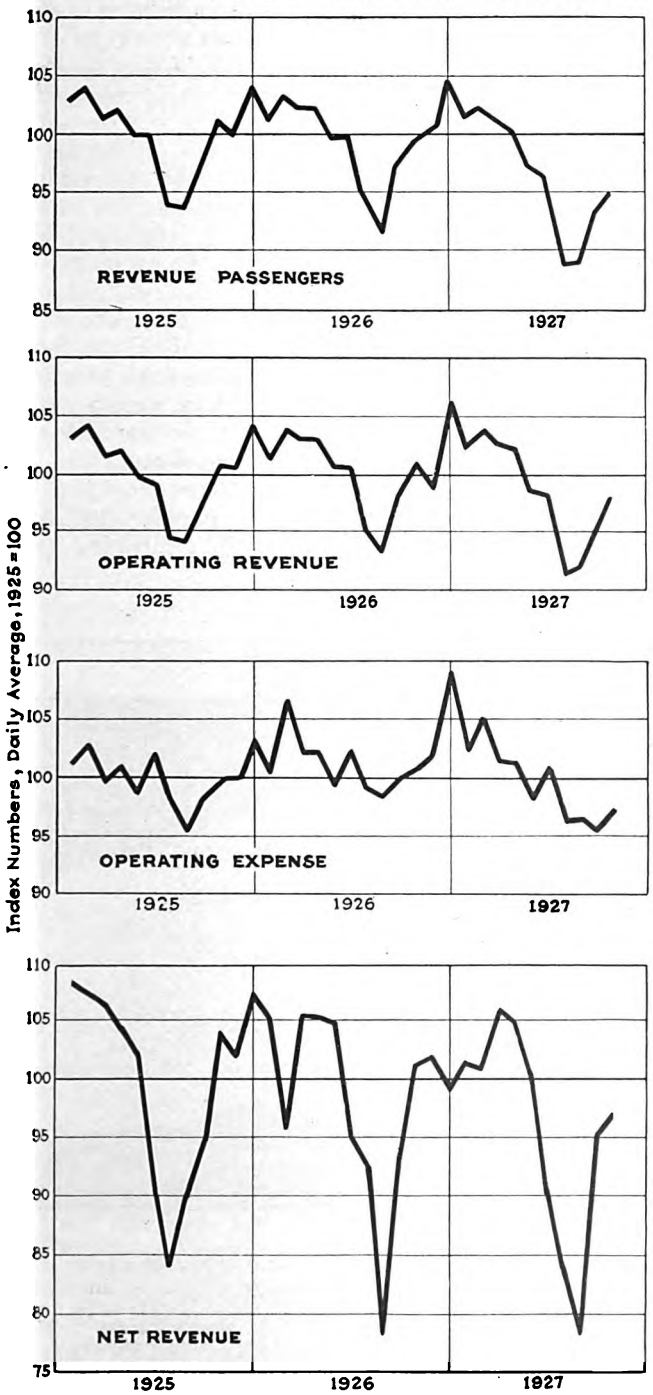
These curves, showing the variations through 1925-27, were prepared by the A.E.R.A. For the period July-October, 1927, the number of companies included is somewhat less than the above number.



considerable extent on account of the pleasure riding in the summer, as well as to the difficulty of providing reliable service under trying winter conditions. With the advent of the automobile there has been a gradual change in the character of the riding on public transportation systems, so that today there is a maximum amount of traffic during the winter months, with a lower amount of business in the summer. The pleasure riding being absent, there is a further reduction in summer because some patrons are on vacations, and many who depend on transportation service in bad weather walk when the streets are clear and the skies are bright. Also, automobiles are used to a greater extent in summer.

As the use of automobiles has increased there has been a change in the character of electric railway traffic which has given concern to many operators. The use of street cars for the wage earner to ride to and from work has gone up, while the incidental use of the cars for shopping and transient riding virtually has stood still. This has accentuated the peaks of traffic, so that while more cars have been needed to carry the peaks fewer are needed for the all-day riding.

Under conditions as they exist today, it is not possible to consider public transportation without taking into account the growth in magnitude of the private automobile as a competitor. As mentioned previously, the advent of this vehicle has had a profound effect on all public transportation methods. Chart II, which shows the relation between the number of electric railway passengers and the automobile registration by years, is of marked interest. It will be seen at a glance that while the number of automobiles in use has grown by leaps and bounds it has not had any great effect in depressing the total demand for public transportation service. The upper portion of the chart shows total electric railway passengers for each year. There has been a practically constant number of riders throughout the period. In the meantime, the number of registrations of automobiles has increased from about 4,500,000 in 1917 to 20,140,000 in 1927, and beside this there has been a much greater use made of each automobile, as their design and relia-

Chart IV—A comparison of the trends of operating revenue, operating expense, net revenue and revenue passengers carried

The information is the same as that used in Chart III, separated for greater clearness. Seasonal variations in revenue passengers are reflected in the operating revenues and net income.

Digitized by Google

bility has improved. A striking illustration of the growth in automobile ownership is that while in 1917 there was about one auto to every 22 persons in the United States, in 1927 there was more than one to every six persons.

Trend of Operations in 1927

The trend of traffic revenues and expenses is shown in Chart III for a group of 134 properties, except for the months subsequent to June, 1927, for which the number of companies is somewhat less, as complete reports are not available. Similar information is shown plotted independently in Charts IV-a, b, c and d. The results for 1927 were slightly under those for the previous year, although the last few months indicate that conditions are improving.

As an indication of the efficiency with which public transportation is being furnished, the corresponding figures for the same group of roads have been plotted in Chart V on a car-mile basis. In general the operating revenue per car-mile is slightly higher in 1927 than it was in 1926. Operating expenses per car-mile, which reached a peak in December, 1926, have fallen almost steadily in 1927, so that toward the end of the year they were under the corresponding months for 1926. The net revenue per car-mile has increased because of the higher operating revenue and lowered expenses per car-mile.

It is quite noticeable that with the reduced traffic in the summer time expenses are not reduced proportionately, and the net revenue has a drop in this portion of the year out of all proportion. This may be accounted for by the necessity for providing a return on the fixed investment, as the net operating revenue per car-mile shows less fluctuation with the seasons than does the gross.

Fare Situation Is Improved

The failure of fares to increase in proportion to the demands made on the companies is shown in Chart VI. There was a lag of about four years, 1913-1916 inclusive, when there was virtually no increase in fares, while wages had gone up nearly 20 per cent. As time went on the difference between wages and fares has become greater, so that today wages are about 110 per cent above the pre-war basis, while fares have gone up only some 55 per cent.

Rates of fare during the past eleven years are shown in Chart VII. It will be noted that in 1917 the 5-cent fare was all but universal, 273 companies out of a total of 303 companies charging 5 cents. There were five companies using zone fares and 25 with 6-cent fares, higher rates being unknown. The 7-cent and 8-cent fares appeared in 1918 and the 9-cent and 10-cent fares in 1919. Today the 10-cent fare is the most popular, 102 companies having this rate, while only 39 companies retain the old 5-cent fare.

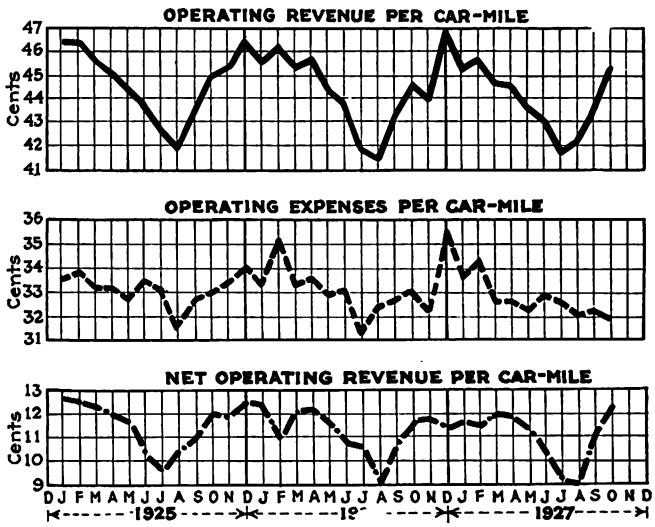


Chart V—Trends of operating revenue, operating expense and net operating revenue, in cents per car-mile

The trends are here plotted for the same group of companies as Charts III and IV. The information was prepared by the A.E.R.A.

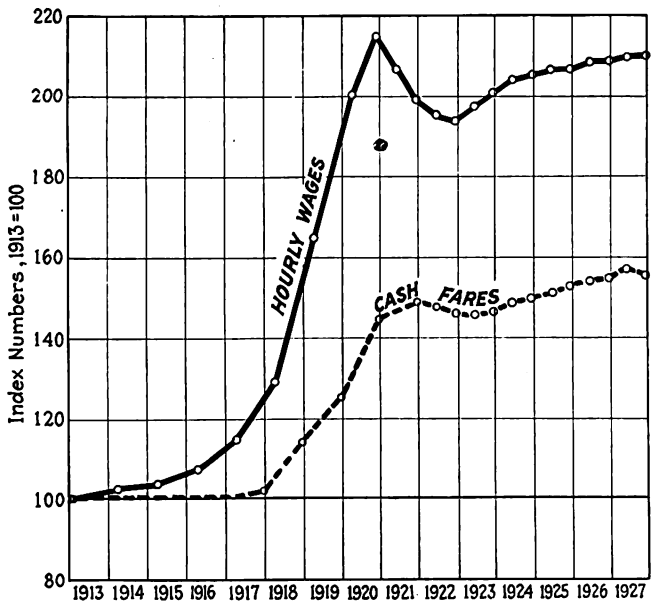

Chart VI—Relative increase in fares and wages in the United States

This comparison, made from information collected by the A.E.R.A., shows that wages have increased 110 per cent since 1913, while cash fares have advanced only 58 per cent.

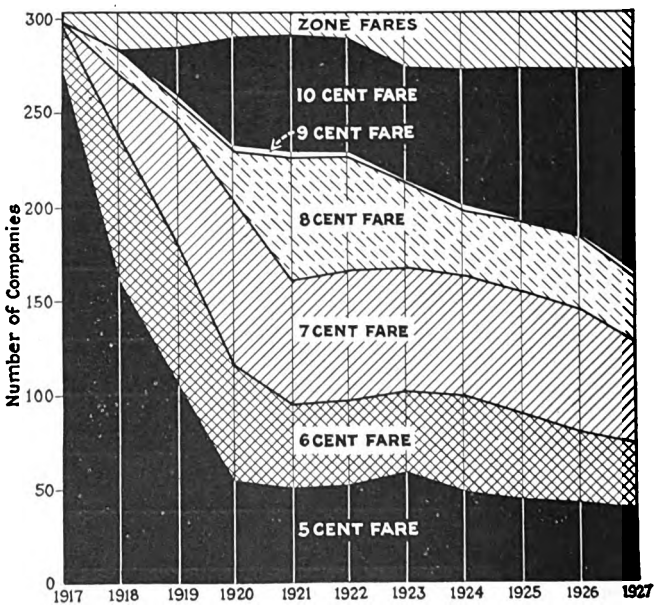

Chart VII—Distribution and trend of cash fares, 1917-1926

This chart, prepared by the A.E.R.A., shows the rapid decline in the use of the 5-cent fare and the corresponding increase in the 10-cent fare and other higher rates.

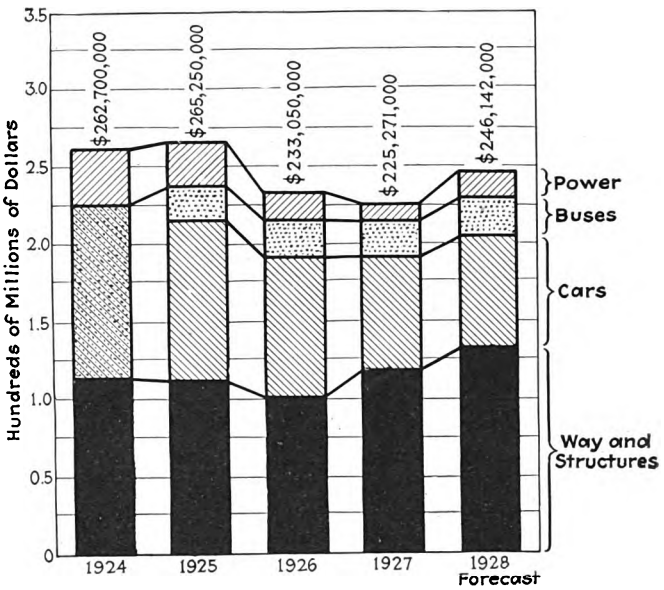
$246,142,000 Expenditure

Planned for Plant and Materials in 1928

This figure, the largest for several years, follows a slight recession in 1927. Large expenditures for track construction in contemplation indicate confidence in rail transportation



Expenditures planned for 1928 by the electric railways show a healthy increase over 1927

BUDGETS of the electric railways show that more expenditures for plant and maintenance materials are contemplated for this year than for any year since 1925. New plant chargeable to capital account is estimated at $147,716,000 and maintenance materials at $98,426,000. The total of $246,142,000, exceeds the actual amount spent by the railways in 1927 by $20,871,000, or 8.5 per cent.

Expenditures in 1927 showed a recession from previous years; in fact, they were the lowest since the JOURNAL has been preparing these estimates of capital expenditures, the first of which was published at the beginning of 1923. It is significant, however, that the reduction was on account of lower expenditures for maintenance materials, for the purchases chargeable to capital account add up to the highest total since 1924. In the preparation of these estimates the practice of

Purchases Planned by Electric Railways for 1928, Compared with Actual Estimates of Past Years Prepared by "Electric Railway Journal"

New Plant and Equipment—Capital

	1924	1925	1926	1927	Forecast 1928
Way and structures	$56,000,000	$52,400,000	$51,200,000	$77,365,000	$89,677,000
Cars	60,200,000	50,400,000	40,000,000	34,758,000	35,495,000
Buses		15,680,000	17,540,000	14,368,000	15,164,000
Power	17,000,000	5,150,000	7,640,000	3,561,000	7,380,000
Total	$133,200,000	$123,630,000	$116,380,000	$130,052,000	$147,716,000

Maintenance Materials and Supplies—Operating

Way and structures	$57,500,000	$56,900,000	$50,000,000	$40,517,000	$41,697,000

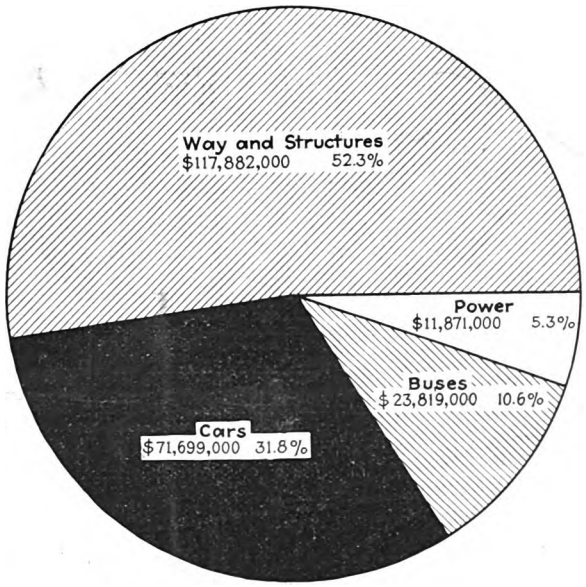
Buses		7,370,000	7,500,000	9,451,000	10,294,000
Power	18,000,000	22,650,000	11,370,000	8,310,000	9,147,000
Total	$129,500,000	$141,620,000	$116,670,000	$95,219,000	$98,426,000

Total of New Plant and Maintenance Materials and Supplies

Way and structures	$113,500,000	$109,300,000	$101,200,000	$117,882,000	$131,374,000
Cars	114,200,000	105,100,000	87,800,000	71,699,000	72,783,000
Buses		23,050,000	25,040,000	23,819,000	25,458,000
Power	35,000,000	27,800,000	19,010,000	11,871,000	16,527,000
Grand total	$262,700,000	$265,250,000	$233,050,000	$225,271,000	$246,142,000

Digitized by Google



How the total of $225,271,000 expended in 1927 for new plant and maintenance materials and supplies was divided

former years was followed of obtaining from a survey of the industry the actual expenditures for 1927 and the proposed expenditures for this year from budget estimates and plans furnished by operating managements. The information included in these reports was prorated to cover the industry. Not only were the number of cars and miles of track considered, but a study of the individual returns was made to eliminate the influence of unusual circumstances.

Track Expenditures Large

Probably the most significant tendency shown by the figures is the large increase in expenditures for track. Actual expenditures in 1927 for track materials were 50 per cent greater than in 1926, which was but slightly below the amounts expended in the previous two years. Notwithstanding this, the expenditures for way and structures materials planned for 1928 exceed the 1927 total by another 19 per cent. With such a program for rehabilitation it is only natural that there should be some reduction in the expenditures for track maintenance. The total to be expended on way and structures for 1928 shows a large gain, both in 1927 and in the forecast for 1928. The indication is that there will be no let-down from the standard of track maintenance set in 1927, for those portions of existing lines not included in the rebuilding programs.

Not only were car purchases for 1927 considerably lower than in the previous year, but the expenditures definitely planted for 1928 show only a small increase. The total proposed is $35,495,000, which is far below the amount spent for cars in any one of the years 1924-1926.

This may logically be considered to reflect the present unsettled car situation and the inability of managements clearly to forecast their car purchases pending the outcome of the widespread experimentation in car design. It is probable that the forecast figure for car expenditures will be considerably exceeded in 1928 by stimulated buying following successful operating experience with some of the newer types of design.

Maintenance material purchases planned for this year, while slightly larger than for last year, are still much below those for previous years. An analysis of the total capital expenditures and a comparison with the reports of cars purchased shows that a considerable amount of rehabilitation and rebuilding work on present equipment was charged to capital account.

Bus purchases planned for 1928 are slightly greater than the record of 1927, indicating a normal growth of this branch of the industry. While the total of more than $15,000,000 is less than the expenditures in the period of most rapid expansion in the use of buses, it indicates that this vehicle continues to be looked on as a necessary part of the railway plant. Success being achieved in the use of buses by electric railways to give preferred forms of service at a distinctly higher level of fares may result in materially increased expenditures for new buses than are indicated in the budget figures. The success achieved by single-deck buses of increased seating capacity and the alertness of bus manufacturers to the improvement of their products may likewise bring about considerably increased buying.

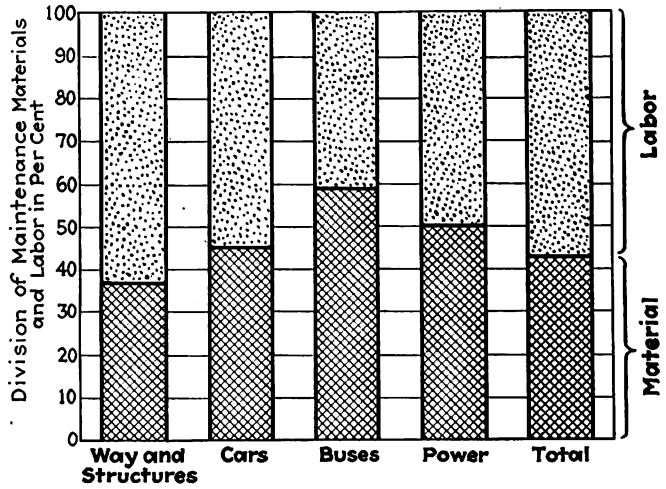
Bus maintenance materials show a considerable increase in 1927, and a still further increase is planned for 1928. The indication is that the need for heavy maintenance on buses purchased three or more years ago is becoming increasingly apparent and must be provided for.

The estimates for power expenditures on capital account were more difficult to make than for the other items, since there is some uncertainty in the replies as to the inclusion of purchased power. The returns this year enabled a better segregation to be made, so that the reduction in this item for 1927 as published does not necessarily mean a recession in the account. Since the forecast for 1928 was made on the same basis as the figure for 1927, a material increase in capital expenditures for power facilities can be expected.

Maintenance Materials and Labor Segregated

In previous budget surveys it has been exceedingly difficult to make a correct segregation of labor from the expenditures planned for materials. Although only materials were asked for, there always was some doubt as to whether the replies made proper allowance for this. In the forms which were used this year separate items of maintenance materials and maintenance labor were provided. The returns which were received were remarkably complete and the segregation was made with comparatively little difficulty.

Of the total maintenance expenditures for the year



The division of expenditures made in 1927 for maintenance into materials and labor is indicated for the elements of way and structures, cars, buses and power

Digitized by Google

Maintenance Materials and Labor

		Way and Structures	Cars	Buses	Power	Total
1927 Expenditures	Material	$40,517,000	$36,941,000	$9,451,000	$8,310,000	$95,219,000
	Labor	66,874,000	44,952,000	6,592,000	8,244,000	126,662,000
	Total	$107,391,000	$81,893,000	$16,043,000	$16,554,000	$221,881,000
1928 Estimated expenditures	Material	$41,697,000	$37,288,000	$10,294,000	$9,147,000	$98,426,000
	Labor	68,232,000	45,680,000	7,471,000	8,144,000	129,527,000
	Total	$109,929,000	$82,968,000	$17,765,000	$17,291,000	$227,953,000

1927, amounting to $221,881,000, the amount paid out for maintenance materials was $95,219,000, or 42.9 per cent; $126,662,000, or 57.1 per cent, was for labor. Roughly, these amounts are respectively three-sevenths and four-sevenths of the total.

In the way and structures accounts, the proportion spent for materials is the lowest, being only 37.7 per cent. This was to be expected, on account of the low relative cost of track materials and the great amount of hand labor involved.

Car maintenance costs show that 45.1 per cent is spent for materials and 54.9 per cent for labor. Contrasted with this, bus maintenance requires an expenditure of 58.8 per cent of the total for materials and only 41.2 for labor. This difference is quite marked, varying but little throughout the individual returns.

Power maintenance requires an almost equal division of the items, 50.2 per cent going for materials.

Estimated labor and material figures for 1928 give practically the same relations between materials and labor as the figures for 1927, checking the proportions. Of the total of $227,953,000 to be spent, $98,426,000, or 43.2 per cent, will be for materials. The figures for way and structures maintenance show an increase of 3.6 per cent for materials.

The complete tables for the two years are included, and the proportions of labor and materials for the several items are given in the accompanying chart.

Statements from Leading Executives Give

High Spots of the Year's Operation

While traffic was somewhat less in 1927, better business is anticipated by many leading operators. Comments indicate that progressive measures have resulted advantageously to the companies adopting them

EXECUTIVES of electric railway companies all over the United States and Canada indicate that the present year bids fair to show revenues higher than those of 1927. While final figures for the entire country are not available, indications are that last year's traffic will be about 1 per cent under the 1926 record of sixteen billion passengers. Progress has been made, however. The reduction in general business has had only a minor effect on the transportation companies.

As Managing Director Storrs sees it, the industry enters upon 1928 with promise of a continued upward swing in its affairs. He considers the outstanding accomplishments of 1927 to be the service improvements that have been made, and the work that has been started in the development of modernized cars that are attractive, light-running and less noisy. He regards as very important the co-ordination under electric railway managements of all major local transportation facilities, including rail cars and buses and in some instances taxicabs. He also regards it as significant that many communities have, with public approval, adjusted fares to a point approximating compensation for good service rendered.

President Stevens anticipates a continuation of the substantial progress made by the electric railways during the year. In his opinion even more progress can be anticipated than in any other year for a long time, first, because of the general awakening of the public to the fact that electric railway transportation cannot be dispensed with; second, because experience in operating buses has determined their limitations as well as their advantages and, third, because the opportunity exists to take advantage of the great progress that has been made in car design and construction.

The opinion of these and other prominent executives on the results of last year's business and the prospects for the coming year are given on the following pages.

Digitized by Google

American Electric Railway Association

CONDITIONS in the local transportation field throughout the United States and Canada improved during the last year. The industry enters upon the year 1928 with promise of a continued upward swing in its affairs.

Outstanding accomplishments during 1927 are service improvements, particularly in the installation of modernized cars that are comfortable, light-running and less noisy. Co-ordination of major transit facilities, including rail cars and buses and in some cases taxicabs under electric railway managements, has been made.

Rates of fare in many communities have been adjusted, with public approval, to a point approximating adequate compensation for good service rendered.

The industry is no longer merely waiting for "necessity riding." The managements realize that if the electric railways companies are going to compete successfully with their keenest competitor, the private automobile, they must render service that will attract those who have been using this personal means of conveyance. While the rail car is the most economical vehicle for mass transportation the bus also has shown that it is a great supplemental aid in a general transportation service. Co-ordinated under single managements these two vehicles give the best possible local transportation.

Because the industry is viewing its future usefulness with recognition of the changed conditions and requirements for its service, and is no longer allowing its expansion to be circumscribed by a mere statistical vision of its past history, the indications for 1928 are better than in any other recent year.

L. S. STORRS,
Managing Director.

American Electric Railway Association

FOR the year 1928, I can anticipate continuation of the substantial progress made by the electric railways in the past year. In my opinion, even more progress can be anticipated than in any other year for a long time; first, because of the general awakening of the public to the fact that electric railway transportation cannot and is not going to be dispensed with; second, because experience in operating buses has determined their limitations as well as their advantages; and third, because of the opportunity which exists to take advantage of the great progress that has been made in street car design and construction.

The purpose of every electric railway system is to supply its communities with a service that will meet the public needs; be so acceptable that the revenues will pay for that service and yield a proper return to those whose investments have made the service possible, thus inviting new capital at reasonable cost to meet ever-expanding requirements. With public consciousness awakened to the realization that electric railway transportation is essential to community progress, the electric railway situation has made rapid strides during the past year. It is true that during the last few years traffic has grown very little, and that even in some places the number of revenue passengers has decreased, but this is due no doubt to the intense competition of private and public automobiles, especially the former.

Notwithstanding this experience in the past, history furnishes no ground for the opinion that the street car is becoming obsolete. The bus lines are handling only a very small proportion of the total number of passengers carried and, as a general rule, are not giving indications that they may be expected to handle any material increase in the percentage of the total local transportation.

To me, the greatest progress in electric railway transportation the past year was the long stride taken in the development of the new types of cars and equipment which, although they are not fully developed and therefore do not yet accomplish the desired results, indicate a great awakening as to the necessity of real sales effort and attractive possibilities for the increase of railway revenues.

R. P. STEVENS,
President.

We believe the prospects for this year are good through better public understanding, through the ride sales campaign participated in by every employee and through the development of public opinion. Traffic congestion is still a problem, but with growing recognition of the efficiency of the street car it is becoming less acute. [B. J. YUNGBLUTH, Buffalo]

Houston Electric Company

Houston, Texas

WITH the fare increase which has been effective for the past six months, we will show a 10 per cent increase in our gross earnings for 1927. Our estimates will call for a further increase in gross revenue of 10 per cent for the coming twelve months. Seventy per cent of this should find its way to the net. The public is showing great interest and appreciation in the new equipment which was furnished during the past year, indicating that service to the patrons is more important than the cost. All signs point to an improved showing for 1928.

JEFF L. ALEXANDER,
Manager.

Southern Pacific Company and Pacific Electric Railway

Los Angeles, Cal

EARNINGS of the electric railways continue to be unsatisfactory although our principal interurban system, the Pacific Electric Railway, has made in 1927 a materially improved showing over 1926, largely due to freight traffic. The electric railways and street car systems in the smaller towns just about held their own where there were no unusual circumstances affecting results. So far as 1928 is concerned, it does not seem probable there will be any material change from 1927. There has been no increase in expenses except where extraordinary maintenance has been a factor.

PAUL SHOUP,
President Pacific Electric Railway; Vice-President Southern Pacific Company.

Cleveland Railway

Cleveland, Ohio

VOLUME of traffic of the Cleveland Railway was less in 1927 than in 1926, which had been slightly greater than the preceding year. In my opinion this reflected lessened industrial and trade conditions rather than competition from privately owned motor cars.

With declining traffic late in 1925 our rate of fare was advanced under our service-at-cost plan so that our passenger receipts last year were the largest in our history. This combination made possible improved service with lessened expense. Material reductions in maintenance, in power and in the cost of injuries and damages were effected. I believe we have touched the low of traffic recession and with service on a higher plane the coming year will bring us better results than the past year.

JOSEPH H. ALEXANDER,
President.

Chicago Rapid Transit Company

Chicago, Ill.

TRAFFIC on the Chicago Rapid Transit Company lines decreased about 1 per cent in 1927. Passenger and freight traffic on the interurban lines increased satisfactorily. Wages and other charges were somewhat higher on all properties. We look for normal improvement in both passenger and freight traffic for 1928.

BRITTON I. BUDD,
President.

International Railway

Buffalo, N. Y.

IMPROVED public relations resulting from a better understanding of the transit problem on the frontier is the outstanding achievement of last year in Buffalo. The need for a financially sound transit system providing efficient,

Digitized by Google

courteous service is generally recognized and is resulting in a more sympathetic public attitude. Considerable track and paving reconstruction was done in 1927, equipment maintenance standards were raised and employee morale was greatly strengthened. The motorbus lines recently installed are well patronized, resulting in extensive improvements in this service. We believe the prospects for next year are good through better public understanding, through the ride sales campaign participated in by every employee and through the development of public opinion. Traffic congestion is still a problem, but with growing recognition of street car efficiency it is becoming less acute. B. J. YUNGBLUTH,
President.

We are optimistic on next year's business. Atlanta's building program, with the city's natural growth, taken in connection with our recent fare increase, should give the Georgia Power Company the most prosperous year since 1920. [F. L. BUTLER, Atlanta]

Denver Tramway Corporation

Denver, Col.

OPERATING revenue of the Denver Tramway Corporation for 1927 continued to decline. It was necessary to pass most of the decrease down to the net, as the operating economies effected during the year were more than offset by the higher prices which had to be paid for fuel requirements on account of a strike in the Colorado coal fields. Expenses for 1928 will show no decreases unless one-man operation is further extended, while the trend of travel still seems to be downward. We trust that this year, however, will witness the satisfactory culmination of many years of litigation over franchises and rates, which may be the long-looked-for turning point for the better.

H. S. ROBERTSON,
President.

Birmingham Electric Company

Birmingham, Ala.

GROSS earnings of the Birmingham Electric Company during the past year decreased 3 per cent, due chiefly to part-time operations in local industrial plants. Operating expenses showed a small increase over 1926, due chiefly to the increased wage scale for platform men. The comprehensive rerouting plan effected in June, 1927, as a result of a traffic survey, has resulted in a substantial saving in car-hours, which will reduce the operating ratio in 1928.

J. S. PEVEAR.
Vice-President in Charge of Operation.

New Orleans Public Service, Inc.

New Orleans, La.

REVENUE for 1927 shows a decided decrease over last year. We are not able to predict for next year, owing to the uncertainty of the national program in connection with the Mississippi Valley.

H. B. FLOWERS,
President.

Indianapolis Street Railway

Indianapolis, Ind.

TOTAL gross earnings of the Indianapolis Street Railway for 1927 were $5,410,000 as compared with $5,518,000 for 1926. Total operating expenses in 1927 were $4,089,000, as compared with $4,269,000 for 1926. Net earnings less taxes for 1927 were $1,013,000, as compared with $594,700 for 1926. During 1927 five substations were built in Indianapolis, resulting in a substantial reduction in the cost of power. The entire stock of competitive bus lines was acquired at the close of 1927 and all buses will be jointly operated in 1928. The adoption of tokens has resulted in a more systematic method of collecting and accounting for fares. We are operating 100 one-man cars out of a total of 300. It is anticipated that these economies in operation will result in material saving for 1928.

ROBERT I. TODD,
President.

Boston Elevated Railway

Boston, Mass.

BOSTON Elevated Railway traffic slightly decreased during 1927 but the net revenue will be greater than a year ago. We look forward to a substantial year in 1928, both in traffic and operating efficiency.

EDWARD DANA,
General Manager.

I believe we have touched the low of traffic recession and with service on a higher plane the coming year will bring us better results than the past year, especially the latter part.
[JOSEPH H. ALEXANDER, Cleveland]

Portland Electric Power Company

Portland, Ore.

REVENUE on the Portland Electric Power Company city lines has shown a steady decrease since 1921, due to increasing inroads by automobiles. The year 1927 was no exception. Gross revenues on the city lines, including buses, decreased 2.62 per cent in spite of an increase of 2 per cent in car and bus-miles operated, largely occasioned by an increase in bus service. Operating expenses of cars and buses decreased 0.65 per cent, due to extension of one-man operation which more than offset increased cost of operating additional buses. Substantial sums spent in modernizing equipment and in extensive advertising campaigns apparently had no influence in retarding the steady drop in revenues. During 1928 we will attempt to provide necessary extensions of service, but we must make every effort to conserve expense and the general policy will be one of retrenchment.

W. H. LINES,
Vice-President in Charge of Railways.

The public is showing great interest and appreciation in the new equipment, . . . indicating that service to the patrons is more important than the cost. All signs point to an improved showing for 1928. [JEFF L. ALEXANDER, Houston]

Capital Traction Company

Washington, D. C.

TRAFFIC on the Capital Traction Company in 1927 was a great disappointment. Automobile competition was felt more severely than in any previous year and caused a falling off in revenue passengers of 4.25 per cent. As expenses and fixed charges were practically the same as in 1926, the net income was materially decreased. The determined drive for selling low-priced automobiles now apparent give little room for optimism in the future and increased rates of fare seem inevitable.

J. H. HANNA,
President.

Dallas Railway & Terminal Company

Dallas, Texas

THE business of the Dallas Railway & Terminal Company showed a falling off in 1927 compared with 1926 of approximately 7 per cent in the number of passengers carried. Due to operating economies, principally the employment of more one-man cars in service, we were able, however, to earn and pay our permitted return of 7 per cent on the property value. A great deal of replacement work has been done during 1927 on the property, but our reserves are in such a depleted condition we have found it necessary to apply to the City Commission for an increased fare. This application was presented on Jan. 9, asking for a 10-cent cash fare with five tickets for 35 cents. Should this re-

Digitized by Google

quest be granted we feel that we will be able greatly to improve the condition of our property and our service to the public during 1928.

RICHARD MERIWETHER,
Vice-President and General Manager.

The outlook for 1928 is more encouraging as to gross business, with no apparent extraordinary burdens in operation. [J. P. BARNES, Louisville]

Washington Railway & Electric Company

Washington, D. C.

WASHINGTON Railway & Electric Company shows 1.36 per cent decrease in revenue passengers carried in 1927 compared with 1926. Operating revenues show a slight increase and operating expenses a slight decrease, leaving approximately 5 per cent increase in operating income. We look for further improvement in 1928.

WILLIAM F. HAM,
President.

Brooklyn City Railroad

Brooklyn, N. Y.

BEGINNING the year 1928, the electric railway industry in spite of the present turmoil over transportation matters in New York, never faced a brighter outlook. There will doubtless always be a golden calf that will receive a certain amount of worship, but the electric railway is and will continue to be the backbone of urban mass transportation, and this fact is being recognized to a greater degree each day.

The industry has passed through its most trying period.

C. E. MORGAN,
Vice-President and General Manager.

Toronto Transportation Commission

Toronto, Ont., Canada

TRAFFIC in 1927 on the Toronto Transportation Commission's system has been quite satisfactory and approximately 4,260,000 more passengers were carried on the street railway and motor bus lines than in 1926. At our average fare of 6.17 cents this results in about $260,000 improvement in gross revenue. In addition, our motor coach operations at separate fares and not in competition with the railway have shown remarkable growth and total $580,000, or 90 per cent more than last year. The total of operating expenses slightly increased in 1927 because of more business, but the unit per car-mile is reduced and is now 28 cents exclusive of depreciation. Our operating ratio is also reduced to 61.5. About 16 per cent of our car mileage is one-man operation. Business conditions appear favorable for 1928 and we hope for continued improvement in traffic in spite of the very serious competition from private automobiles.

D. W. HARVEY,
General Manager.

Philadelphia Rapid Transit Company

Philadelphia, Pa.

ALTHOUGH the latter portion of 1927 witnessed a definite falling off in street car riding in Philadelphia, there seems to be no occasion for grave alarm concerning prospects for the current year. It is probable that the decrease in riding was occasioned by a temporary slowing up of industry in this section. Excellent records have been established by the Philadelphia Rapid Transit Company during 1927 for accident reduction and for operating economies. In the current year we shall aim toward a further co-ordination of public transportation media in this city. It is not expected that traffic and operating expenses will fluctuate materially during 1928.

R. T. SENTER,
President.

We look forward to a substantial year in 1928, both in traffic and operating efficiency. [EDWARD DANA, Boston]

Georgia Power Company

Atlanta, Ga.

STATISTICS for 1927 are not available until next week, but the Georgia Power Company expects a decrease of 2½ per cent in operating revenue and 2 per cent in expenses. We are optimistic on next year's business. Atlanta is building two viaducts at a cost of $2,000,000, a new $1,000,000 city hall, and its school-building program calls for between three and four million. This program, with the city's natural growth, taken in connection with our recent fare increase, should give the Georgia Power Company the most prosperous year since 1920.

F. L. BUTLER,
Vice-President in Charge of Operation.

Louisville Railway

Louisville, Ky.

EARNINGS of the Louisville Railway fell off by about 1.23 per cent due to reduced riding. This is probably a reflection of rather quiet business conditions, especially during the summer. The net result of the year's operation is approximately one quarter million dollars applicable to common stock. A 3 per cent dividend was paid. The outlook for 1928 is more encouraging as to gross business, with no apparent extraordinary burdens in operation.

J. P. BARNES,
President.

TO ME, the greatest progress in electric railway transportation the past year was the long stride taken in the development of the new types of cars and equipment which, although they are not fully developed and therefore do not yet accomplish the desired results, indicate a great awakening as to the necessity of real sales effort and attractive possibilities for the increase of railway revenues.

—R. P. STEVENS.

Digitized by Google

Marked Increase in
Track Construction in 1927

Mileage of electric railway track rebuilt exceeded that of any other recent year. Extensions were slightly less than in 1926. Amount of track abandoned was small compared with amount of new bus routes added

GREATER activity in track reconstruction was shown by the electric railways in the year just ended than in any other year since 1917. Reports received by this paper from more than 650 companies indicate that approximately 900 miles of track was rebuilt in 1927. This is the largest figure of any year for which records are available. At the same time, extensions to city and interurban trackage and electrified steam lines totaled more than 300 miles, making the sum total of all trackwork done by the electric railway industry last year about 1,220 miles.

Altogether 217 electric railways reported track rebuilt during the past year. This was an increase over 1926, when 181 companies made such reports, and 1925, when the number was only 160. Approximately 700 miles of city track was rebuilt, as compared with 600 miles the preceding year. Reconstruction of interurban track totaled approximately 200 miles, or very nearly the same amount as was reported for the preceding year. Companies which rebuilt interurban track last year numbered 67, as compared with 63 in 1926 and 46 in 1925.

Extensions to city track last year totaled about 150 miles, or somewhat less than the total for the year before, which was about 200 miles. The number of companies making extensions to city track, however, was slightly larger than the year before, although it was less than two years ago, the figures being 80 in 1927, 75 in 1926 and 80 in 1925. Extensions to interurban track in 1927 were substantially less than the preceding year, due to the absence of any large extension programs. Nevertheless, 34 electric railways reported a total of approximately 40 miles of interurban trackage added during the year.

Comparison of Track Construction by Years

Year	No. of Companies	Track Extensions—Miles—City	Track Extensions—Miles—Interurban	Track Extensions—Miles—Total	Track Rebuilt—Miles—City	Track Rebuilt—Miles—Interurban	Track Rebuilt—Miles—Total	Electrified Steam Lines, Miles

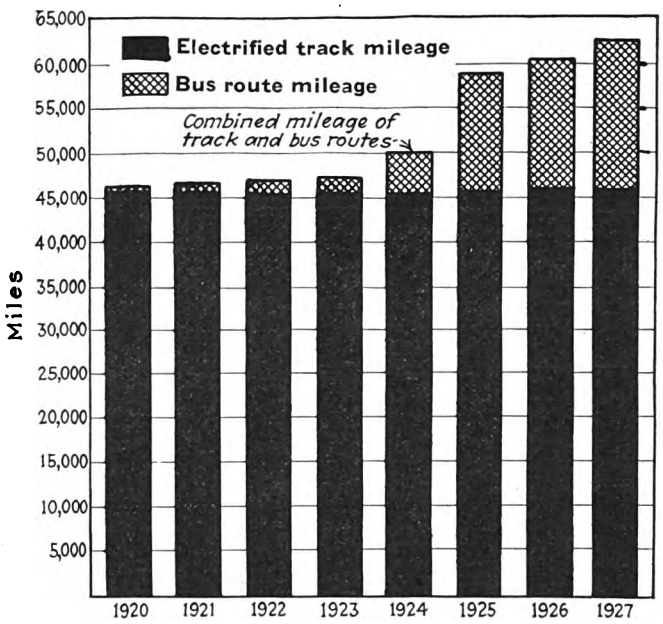
(a) Information not available.



Combined track and bus mileage of the electric railways has increased more than one-third since 1920

In 1926 companies which built new interurban track numbered 38 and in 1925 the number was 35. An accompanying chart shows graphically the comparative amount of reconstruction by years since 1919, as well as the annual additions to electric railway trackage.

First place among the city companies which rebuilt track last year is held by the Chicago Surface Lines with some 45 miles of reconstruction. The Pittsburgh Railways and the Philadelphia Rapid Transit Company come next in order, with about 30 miles of reconstruction apiece. Other electric railways which executed large programs of this kind during the past year include the Kansas City Public Service Company, Cincinnati Street Railway, Public Service Railway of New Jersey, St. Louis Public Service Company, Key System Transit Company, Los Angeles Railway and the Cleveland Railway. The Illinois Traction System holds first place in reconstruction of interurban track during the past year. Extensive work of a similar nature was done by the Texas Electric Railway and the Pacific Electric Railway.

Outstanding among the extensions to city trackage which occurred during the past year was the addition of more than 29 miles to the New York State Railways at Rochester. This came about through the conversion of a portion of the old Erie Canal into a rapid transit subway through the city. An extension of about 8 miles was made by the Twin City Rapid Transit Company and one

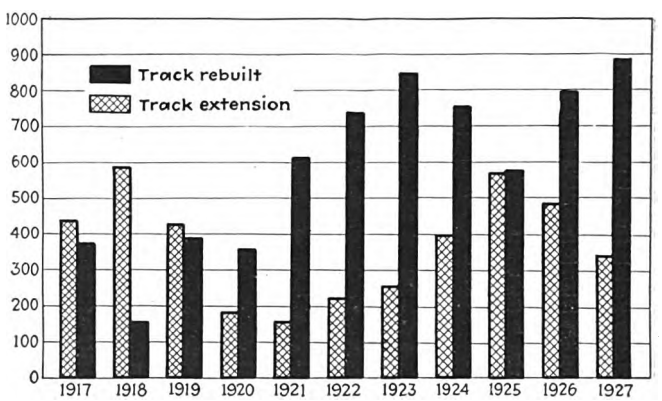
of 9½ miles by the Municipal Railway of San Francisco. Substantial extensions of city trackage were reported also by the Pacific Electric Railway, Los Angeles Railway, Detroit Department of Street Railways, Detroit United Railway, Interborough Rapid Transit Company, Cleveland Railway, Georgia Power Company, Houston Electric Company, Virginia Electric & Power Company, and the Montreal Tramways. The most notable extensions to interurban trackage were made by the Pacific Electric Railway, Illinois Traction System and the New York, Westchester & Boston Railway.

Another important branch was added to the rapid transit system of the Boston Elevated Railway, Boston, Mass., by the opening, on Nov. 5, of the first section of the Dorchester tunnel extension. This extension runs from Andrew Square, which has been the terminal for some years, to Fields Corner in Dorchester and cost $5,000,000. It is being carried to Mattapan as fast as the work can be done, at an expense of another $5,000,000. The new line is a heavy, rock-ballasted, third-rail road, smooth riding and quiet. The roadbed occupied is the former roadbed of the New Haven Railroad, purchased by the Boston Elevated. This development may lead to the abandonment of more short-haul business by the steam railroads entering Boston, in order that it may be more advantageously handled by the local railways, mainly the Boston Elevated.



Track reconstruction in 1927 was greater than in any other year of the past decade

The New York, Westchester & Boston Railway's extension of its eastern division to a new terminal at Harrison, N. Y., was completed on July 2 and opened for regular service on July 3. With the opening, Harrison became the eastern division terminal, which since March, 1926, had been at Mamaroneck. For fourteen years prior to that time the terminal was at Larchmont. A further extension to Rye is already under way. This makes another step toward the projected establishment of

Digitized by Google

a permanent terminal at Port Chester, at the Connecticut State line.

Electrification of steam railroad trackage totaled slightly more than 140 miles during the year just ended. Nine such projects were reported, the same number as the year before. Outstanding among these was the electrification of the Sea Beach branch of the Long Island Railroad. This company alone added more than 90 miles to its electrified trackage. Other electrification projects were comparatively small, but represent a substantial total.

Interchange of through freight traffic among the Long Island, the Pennsylvania and the New Haven Railroads, by means of electrically operated freight trains, commenced on July 8, when electric locomotives replaced steam locomotives in the movement of freight cars from Bay Ridge, Brooklyn, to Port Morris, in the Bronx, via the Bay Ridge division of the Long Island Railroad, and the Hell Gate Bridge Route of the New York Connecting Railroad.

This is the first step taken by the Long Island Railroad to electrify its freight lines in Greater New York. The estimated cost of electrifying the Bay Ridge division exceeds $4,000,000.

In conjunction with this electrification the New York Connecting Railroad electrified its freight tracks between Fresh Pond and Port Morris, known as the Hell Gate Bridge Route.

Another electrification project for which first steps were taken during the past year is that of the Boston, Revere Beach & Lynn Railroad, popularly known as the "Narrow Gage." The new management, recently installed, plans to electrify both the 12-mile double-track main line between Lynn and the East Boston Ferry terminal and the Winthrop loop line.

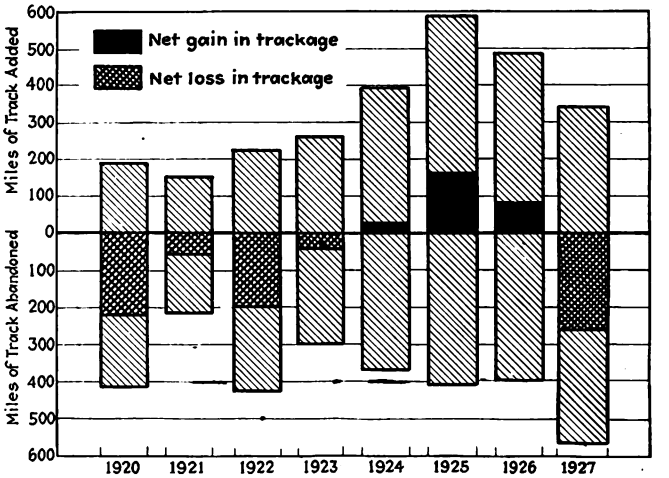
The 3-ft. gage will be retained on the entire system, totaling 34 miles of single track. The complete program will cost more than $1,000,000 and includes the purchase of new car equipment, remodeling of all stations, installation of an overhead system and the construction of substations.

Electric operation will provide not only a faster ride but also a cleaner ride. This feature will be appreciated particularly in the tunnels on the road, where the smoke from the steam locomotives has proved in the past a nuisance to the patrons and a problem to the owners.

In order to finance the proposed improvements the directors have recommended to the stockholders that they authorize immediate application to the Department of Public Utilities for authority to issue 1,700 additional shares of stock and $1,000,000 of general mortgage bonds of the company.

During the past year ten electric railways with a total trackage of approximately 160 miles abandoned all rail operation. Two of these installed bus service in place of car service. Bus service under different management replaced the transportation service formerly given by five of these railways. In the three remaining instances it appears that no service of any kind is now being given.

Car operation was replaced by bus operation on trackage totaling about 450 miles by electric railways which continued to operate the major parts of their systems. A total of approximately 600 miles of track was definitely abandoned. Extensions to bus routes to the extent of more than 3,000 miles were made by the electric railways and the combined track and bus mileage of the local transportation systems therefore showed a substantial gain for the year. Details of the additions to bus routes are given in an article published elsewhere in this issue.



Net gain or loss of trackage by years

Entire Abandonments in 1927

	Miles
Louisiana Electric Company, Lake Charles (*A*)	7.55
Shawnee-Tecumseh Traction Company (*A*)	9.51
Mesaba Railway (*B*)	38.00
New Bedford & Onset Street Railway (*B*)	21.24
Reno Traction Company (*B*)	7.50
Chicago & Interurban Traction Company (*B*)	41.00
Hoosick Falls Railroad (*B*)	7.55
Allen Street Railway (*C*)	5.42
Jefferson Traction Company (*C*)	18.00
Lewisburg & Ronceverte Electric Railway (*C*)	6.20
Total	161.97

(*A*) Complete substitution of buses under same management.
(*B*) Complete substitution of buses under new management.
(*C*) Complete abandonment—no service now given.

Looking back over the record of the electric railways during the past decade it is noteworthy that additions to the trackage of the industry have been considerably greater than the abandonments. A total of 4,060 miles of new track has been added, while the abandonments have amounted to only 3,800 miles. Of this latter figure 1,380 miles represent parts of railway systems where the bus has replaced the electric car. Nearly all of these abandonments were interurban or suburban track where traffic was extremely thin. In many instances it is extremely doubtful if there ever was any economic justification for its construction.

Substitution of buses under the same management over the entire system has occurred on 46 properties with 460 miles of track, or about 10 miles apiece. The majority of these railways were local lines in towns of less than 20,000 population. Complete abandonment and substitution of buses operated by other agencies has occurred on 1,180 miles of track. Included in this figure are a few medium-sized interurbans and a considerable number of small railways with less than 10 miles of track. Approximately 630 miles of track has been entirely abandoned and no service of any kind is now given. In this classification also the average size of the properties abandoned is less than 10 miles.

Summarizing the situation as it exists today, there has been a net gain of several hundred miles in the trackage of the electric railway industry since the beginning of 1917. During this period about 18,000 miles of bus route has been added. Thus the present total for track and bus together is approximately 64,000 miles, or nearly 50 per cent greater than the pre-war mileage of the local transportation industry.

Passenger Car Purchases Low in 1927

Much attention was given during the year to experimental development of passenger cars and trucks. There were 824 city type passenger cars, 121 interurban passenger cars, 40 electric locomotives and 363 freight and miscellaneous cars ordered during 1927. This is a low volume for new electric railway rolling stock

Table I—Number and Types of Cars Purchased During 1927

	U.S.	Extraterritorial	Canada	Total
Number of companies reporting purchases of new cars	53	2	6	61

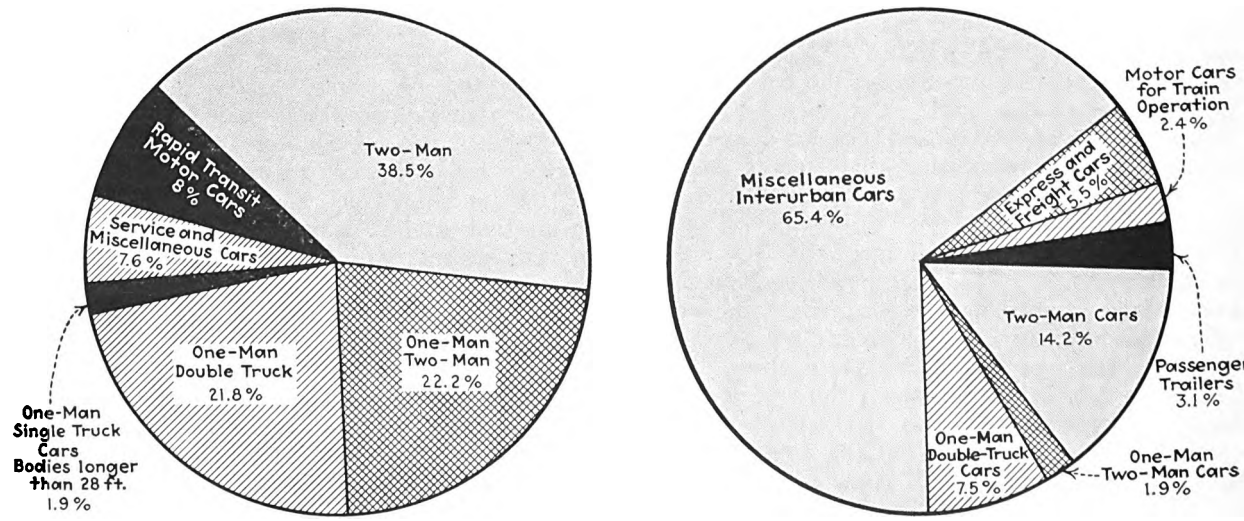
Total for interurban service	415	..	1	416
Electric locomotives	38	1	1	40
Total cars and electric locotives	1,220	15	113	1,348

ORDERS for a total of 1,348 cars and electric locomotives were placed during 1927. Except for the year 1921, when only 1,276 cars and electric locomotives were bought, the number for 1927 is the lowest for any year since 1907, when ELECTRIC RAILWAY JOURNAL began first to compile these statistics. The buying was confined to a comparatively few railways, there being only 61 properties that reported purchases of new rolling stock. These are divided 53 in the United States, two extraterritorial and six in Canada.

There were seventeen railways that purchased twenty or more passenger cars. These seventeen railways account for nearly 72 per cent of the total passenger car orders. The number of railways is the same as for 1925, but a decrease of five from 1926, when 22 railways reported purchases of twenty or more cars. The largest order during 1927 was that of the Department of Street Railways for the city of Detroit, which purchased 125 double-truck two-man cars for city service. The work of building these cars was divided among three car plants. The Springfield Street Railway, Springfield, Mass., bought 51 double-truck one-man cars and the St. Louis Public Service Company built the same number of double-truck, two-man cars. Four railways purchased 50 passenger cars. The Eastern Massachusetts Street Railway and the Worcester Consolidated Street Railway each bought 50 double-truck one-man, two-man cars; the Montreal Tramways 50 double-truck two-man cars and the New York Rapid Transit Corporation 50 triplex units for subway service and one supply car. These triplex units consist of three car bodies mounted on four trucks. The end bodies are each 47 ft. 11⅛ in. long and the center section is 41 ft. 1¾ in. long. The combined length is 137 ft. 3 in. over all and seats are provided for 160 passengers. Companies purchasing twenty or more cars are listed in Table III.



Diagrams showing the proportion that each type of car bears to the total purchased during 1927

*Includes motor and trail cars for subway, elevated and train service. (a) Not available.

The statistics of new rolling stock given in the tables and charts herewith when analyzed in detail show decreases for all types except one-man double-truck passenger cars for city service, two-man cars for city operation and service, freight, express and miscellaneous cars. There were 363 cars in the latter class, divided 68 service and miscellaneous cars for city service, 23 express and freight cars and 272 miscellaneous cars for interurban service. The total of these classes for 1926 was 264 cars, so there is an increase of 99 cars for 1927. This increase is due to an order for 250 dump cars and ten flat cars placed by the Illinois Traction, Inc.

Interest naturally centers in passenger car purchases. Comparison of the years 1925, 1926 and 1927 shows a total of 945 passenger cars ordered during 1927, as compared with 1,558 in 1926 and 1,374 in 1925. There were 754 city surface passenger cars bought in 1927, as compared with 932 in 1926; 70 rapid transit motor cars purchased in 1927, as compared with 317 in 1926, and 121 interurban passenger cars bought during 1927, as compared with 309 in 1926. The only classes of passenger cars that show an increase for 1927 over 1926 are double-truck one-man cars for city service and two-man cars for city service, there being 195 double-truck one-man cars purchased in 1927, as compared with 121 for 1926, and 344 two-man city cars bought in 1927, as compared with 139 in 1926. Comparative numbers of the various types of cars purchased during the last twelve years are given in Table II.

Special comparisons of new cars purchased during 1927 are given at the beginning of this article in Table I and the diagrams on page 56 show at a glance just what types of cars are being bought in greatest proportion. Of cars purchased for city service 344, or nearly 39 per cent, are of the two-man type. The number of double-truck one-man cars and one-man, two-man cars are nearly the same, there being 195 of the former and 198 of the latter. The number of each type constitutes approximately 22 per cent of the total cars for city service. These three types of city passenger cars constitute 82.5 per cent of the total, the remainder being made up of seventeen single-truck one-man cars, 70 motor cars for rapid transit lines and 68 miscellaneous cars.

Of the interurban cars, miscellaneous service cars constitute more than 65 per cent of the total. The two-man type for interurban passenger service predominated, there being 59 of these bought, or slightly more than 14 per cent of the total. There were purchased 31 one-man interurban cars, 7.5 per cent of the total; 23 express and freight cars, 5.5 per cent; thirteen passenger trailers, 3.1 per cent, and ten motor cars for train operation, 2.4 per cent. Of the cars reported for interurban service, eight,

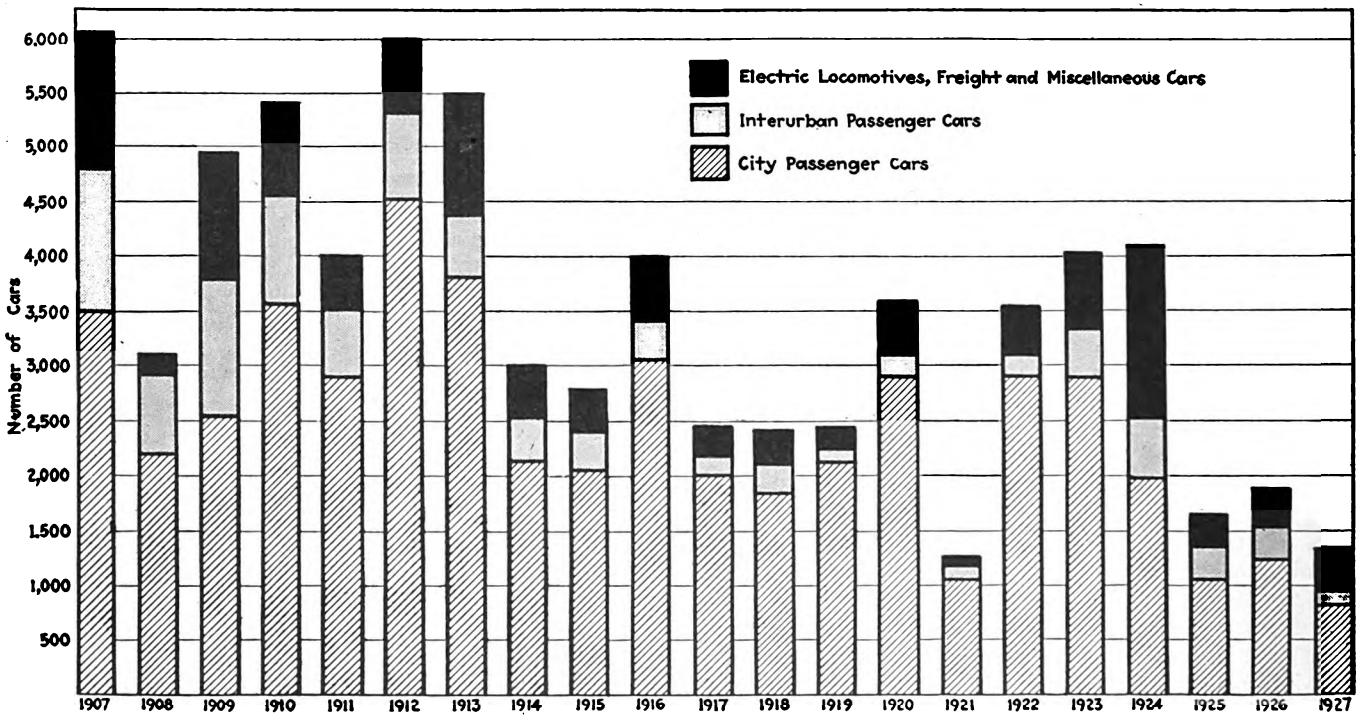
Digitized by Google

or about 2 per cent of the total, were classified as one-man two-man type.

The trend toward one-man operation, which was introduced with the Birney safety car and later through the purchase of double truck one-man cars and one-man, two-man cars, is shown in the chart on page 59. One-man single-truck cars with 28-ft. bodies, the original safety cars, made their first appearance in 1916, when 187 were purchased. This type of car increased in popularity up to and including 1920, when a total of 1,699 cars of this type were bought. Purchases of all types of adopted this year will make it more convenient to locate a particular electric railway for detailed information than with the other arrangement. Reports from railways in the Dominion of Canada and districts outside continental United States are grouped separately. In addition to listing the number of cars ordered by the individual companies, the table shows the class of car and type of service. It also gives data as to length, seating capacity, weight and number of motors for the cars.

The greatest number of cars purchased by railways in a single state was for Illinois, where a total of 340 cars



Graphical analysis of city cars, interurban cars and total cars and electric locomotives purchased during the past 21 years

cars in 1921 took a decided drop and the number of single-truck one-man cars purchased in that year was but 565. However, they constituted nearly 60 per cent of the total motor cars purchased for city service during that year. During the year 1922 there was a reaction away from the use of single-truck cars and double-truck one-man and one-man, two-man cars made their first appearance. There were 772 single-truck one-man cars with 28-ft. bodies, 227 one-man cars with bodies longer than 28 ft. and 471 one-man, two-man cars purchased in 1922. Since that time the number of single-truck one-man cars bought each year has decreased and their place has apparently been taken by one-man and one-man, two-man double-truck cars. The greatest number of one-man, two-man cars was purchased during the year 1924, when a total of 1,224 were reported. Since then purchases of all types of cars have fallen off. Of the motor-passenger cars purchased for city service during 1927, 45.6 per cent were two-man cars, 26.3 per cent were classified as one-man, two-man cars, 25.8 per cent one-man double-truck cars, 2.3 per cent one-man single-truck cars.

Details of rolling stock ordered by individual companies are given in Table IX. In this table the railways are arranged alphabetically for each state and the states in turn are arranged alphabetically. This arrangement is somewhat different than the method followed in previous years of grouping the states according to geographical divisions. It is believed, however, that the grouping were purchased. Of these, however, 260 were miscellaneous dump and flat cars for interurban service. The largest purchases of passenger cars were in the state of Massachusetts, there being a total of 161 passenger cars for city service reported. The total of all types of cars for the state was 194. The state of Michigan was brought into third place in the number of car purchases by the order of 125 cars by the Department of Street Railways for the city of Detroit. The total number of new cars reported by railroads in Michigan was 136. New York State is in fourth place, with a total of 93 new cars reported. Pennsylvania and Ohio, which in previous years have been leaders in the number of cars purchased, were far behind during 1927, there being but 34 cars reported by railways in Pennsylvania and but fifteen for the railways in Ohio.

For convenience in comparing rolling stock purchases during the past 21 years, and to show at a glance the number of cars purchased as divided between city and interurban passenger cars and freight, express service and miscellaneous cars, Table V has been prepared. This gives the total number of cars ordered each year beginning with 1907. Rolling stock purchases are divided into four classes: First, city passenger cars; second, interurban passenger cars; third, freight, express and miscellaneous cars, and, fourth, electric locomotives. In this classification cars for electrified steam railroad suburban service are included with interurban cars. The miscel-

Digitized by Google

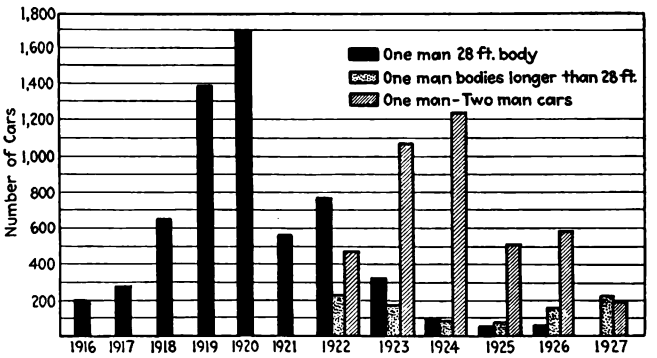
laneous cars include service cars, snow plows, sweepers, work cars, etc.

In addition to this table, the trend of purchases is shown by diagrams. The total rolling stock purchased for each year is divided into city passenger cars, interurban passenger cars and miscellaneous express, freight, service and electric locomotives. High points of purchases are shown by the chart for the years up to and including 1913, again for 1916, 1920, and for the years 1922, 1923 and 1924.

A special comparison of cars ordered during the last twelve years is given in Table II. Cars are listed separately for city and interurban service and each class divides the various cars according to type. It is interesting to note how the number of single-truck cars purchased yearly increased up to 1920. Since then the swing in car purchases has been toward the use of longer bodies with double trucks. The trend for each class of car has been discussed in connection with each individual classification.

Purchases of electric locomotives during 1927 are listed in Table IV. The total number of electric locomotives bought is 40, as compared with 60 for 1926 and 47 for 1925. The Long Island Railroad was the largest purchaser with fifteen 160-ton, one 100-ton, one 80-ton and two 25-ton locomotives. The New York, New Haven & Hartford Railroad purchased five 170-ton locomotives, and the remaining sixteen locomotives purchased during 1927 are divided among ten electric railways.

The last column of Table IX shows the number of cars junked during the year. During 1927 a total of 1,597 cars were reported by electric railways as being junked. By grouping these into classes it is found that they consisted of 1,374 city passenger cars, 81 interurban passenger cars and 142 miscellaneous service, freight



Relative purchases of one-man and one-man, two-man cars for the last twelve years

work and snow plows. There were 1,626 cars junked during 1926, and of these 1,402 were city passenger cars.

An accompanying diagram shows graphically the number of cars junked during the past six years. Comparison of the figures shown in this diagram indicates that the number of cars junked during 1927 exceeded those for the years 1922 and 1925. The greatest number of cars reported junked during any one year was in 1924, when a total of 1,853 cars were reported. New cars purchased for replacements during that year, however, were more than three times the number for 1927.

In analyzing the various one-man, one-man, two-man and two-man cars ordered for city service during 1927 it is found that they run quite uniform in length, weight and seating capacity. Detailed figures are given in Tables VI, VII and VIII. The length of the one-man double-truck cars ordered for city service varies from 39 ft. 11 in. to 46 ft. 4 in. The weighted average length for all cars of this type is 43 ft. 8 in.

Weights of this class of cars vary from 12 tons to 20.1 tons. The 12-ton car is the Chicago & Joliet car with aluminum body. The Springfield car with worm drive is reported as weighing 12.65 tons. Aside from these two cars the minimum weight is 14.7 tons. The weighted average for all cars of the one-man double-truck type is 17.7 tons. Seating capacities of one-man double-truck cars ordered for city service vary from 36 to 54, with a weighted average of 47 seats.

Cars reported as of the one-man, two-man type are of the same average size as one-man cars. Weights are just a little greater. Lengths vary from 40 ft. 8 in. to 51 ft. and the weighted average length for all cars of this type ordered in 1927 is the same as for one-man cars, namely, 43 ft. 8 in. Weights of one-man, two-man cars varied from 14 tons to 20 tons, with a weighted average for all cars of this class of 18 tons. Seating capacities varied from 44 to 56 and the weighted average was 47 seats, the same as for the one-man class.

IDM—Interurban, double truck, motor
IDOT—Interurban, double truck, open trailer

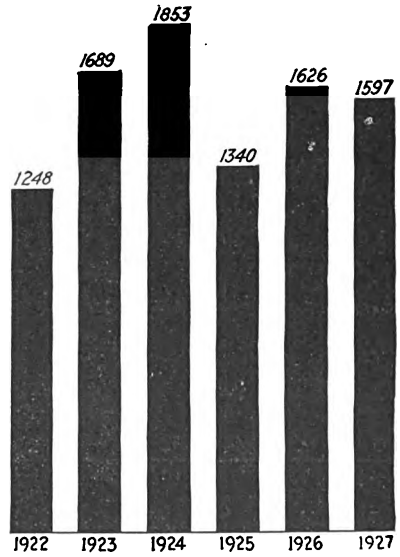
The two-man passenger cars ordered for city service in 1927 were larger than the two other types. Lengths of two-man city cars varied from 40 ft. 11 in. to 50 ft. 8 in. and the weighted average length for all cars of the class is 47 ft. 6 in. Weights of two-man city cars varied from 15 to 25½ tons and the weighted average is 18.6 tons. Seating capacities varied from 42 to 60 with an average of 48. The accompanying summary shows weighted averages for the three types of city passenger cars purchased in 1927 compared with average city cars purchased in 1926.

Average Double-Truck Passenger Cars Purchased for City Service in 1927

	Length	Weight, Tons	Seats
One-man double-truck	43 ft. 8 in.	17.7	47
One-man, two-man	43 ft. 8 in.	18.0	47
Two-man	47 ft. 6 in.	18.6	48
Average of city cars purchased in 1926	43 ft. 5 in.	17.36	44

In general design cars ordered during 1927 have been particularly distinctive and have shown a decided tendency toward de luxe appearance and accommodations. Never before in the history of the industry has so much attention been devoted to improving car appearance and the attractiveness of furnishings. The various car manufacturers have spent large sums of money in developing improved types of cars and trucks, and several have built experimental cars without orders. Trucks with worm and double reduction drive are being tried to permit the use of small high-speed motors and to reduce weight and noise. Particular attention has been given to increasing rates of acceleration and braking.

The statistics which have been assembled and are given in the accompanying tables of rolling stock were obtained from replies to the questionnaires sent to all electric railways in the United States and Canada. Replies were received from more than 90 per cent of all the properties addressed. Through the courtesy and co-operation of the various car manufacturers, lists of cars built by them during the year were furnished so that the replies received from railways could be checked very carefully. In a few cases where replies were not received from electric railways themselves the information furnished by the car manufacturers has been used. Replies were received from all car manufacturers. In addition to the information obtained from these two sources the files of ELECTRIC RAILWAY JOURNAL have been gone over carefully to check and verify figures. These include car orders contemplated as well as actually placed. Particular care has been used to verify figures which appeared doubtful.



Number of cars reported as junked during the last six years

Expansion of Bus Operation

Continued During Past Year

Number of buses operated by electric railways increased nearly 20 per cent. Purchases of new equipment were slightly less than the year before. Bus route extensions made in 1927 total more than 3,000 miles

GROWTH of bus operation by the electric railways continued during 1927 at about the same rate as in the preceding year. The number of buses increased from 7,749 at the beginning of the year to 9,229 at its close. This was an expansion of approximately 20 per cent. The number of electric railways engaged in bus operation increased from 333 a year ago to 351 at the present time. Extensions of nearly 3,200 miles in the length of bus routes operated by the railways occurred during the past year, bringing the total to more than 18,000 miles. This increase was substantially larger than that of 1926, and represented a growth of slightly more than 20 per cent.

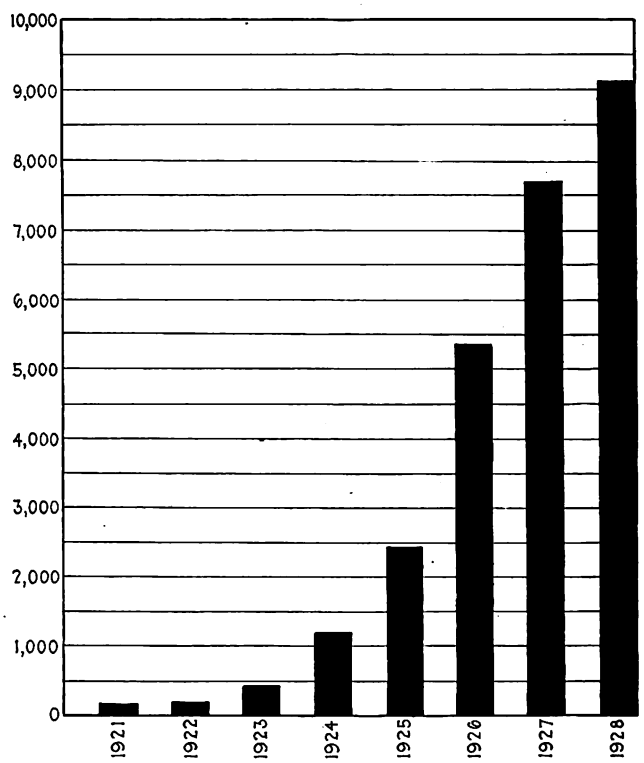
Buses purchased by the electric railways in 1927 totaled 1,801. Of this number about 95 per cent were bought new, while the remainder were second-hand vehicles acquired with the purchase of bus lines already in operation. In all, 147 electric railways reported the purchase of additional bus equipment last year. The number of railways making such purchases as well as the number of vehicles bought was slightly less than in 1926. A general tendency toward smaller and lighter vehicles was evident in the orders last year.

During the past year about 400 buses were scrapped compared with 160 scrapped in 1926. These figures included buses sold, traded in, converted to other uses and disposed of in various ways. While the net increase during the year in the number of buses operated is approximately equal to the difference between the number purchased and the number scrapped, exact calculations are impossible, because of the time which elapsed between the placing of orders for bus equipment and its actual delivery. For example, buses ordered in 1926 and delivered in 1927 appear on the record as an increase in the number of vehicles owned, although they are not included in the purchases for the year just ended.

The largest purchaser was the Public Service Railway of New Jersey and the affiliated Public Service Transportation Company, which bought a total of 316 buses during 1927. The next largest addition was that of 205 buses by the Philadelphia Rapid Transit Company. Other large purchasers include the Toronto Transportation Commission, 70; Cleveland Railway, 50; New York & Stamford Railway, 50; the associated Shore Line and Southwestern Michigan Motor Coach Companies, 43; the United Railways & Electric Company of Baltimore, 37; Monongahela West Penn Public Service Company, 37; International Railway, 33; Montreal Tramways, 31; Worcester Consolidated Street Railway, 30; Los Angeles Railway, 29; United Traction Company of Albany, 27; Virginia Electric & Power Company, 25; Illinois Power & Light Company, 24; Connecticut Company, 23, and the Pittsburgh Railways, 23.

Approximately 85 per cent of the buses bought last year were equipped with mechanical drive. The figures show that about 280 vehicles, or 15 per cent of the total, were equipped with gas-electric drive. This ratio is very nearly the same as that which prevailed in 1926.

De luxe and semi-de luxe buses were prominent among the purchases last year. A total of approximately 250 such vehicles was ordered. The largest purchaser of this type of equipment was the Philadelphia Rural Transit Company, subsidiary of the Philadelphia Rapid Transit Company. The Toronto Transportation Commission, which has been very successful in the operation of de luxe buses under the auspices of its subsidiary, the Gray Coach Lines, Ltd., bought 30 more vehicles of this type. The Pittsburgh Railways bought 23 de luxe buses for use in express service at a higher fare. Other large purchasers of de luxe bus equipment include the Shore Line Motor Coach Company, 21; Charleston Interurban Railway, 16; Wisconsin Power & Light Company, 13. In



Number of buses operated by electric railways

Total	1,801				

all, 27 electric railways were reported as ordering equipment of this type last year.

Only 63 double-deck buses were purchased in 1927 by the electric railways. This figure is smaller than that of any of the preceding three years. All three of the purchasers were large city companies which already had double-deck equipment in service. They were the Philadelphia Rapid Transit Company, which bought 50, the Cleveland Railway, eight, and Los Angeles Railway, five.

The increase in the number of electric railways operating buses from 333 at the beginning of the year to 351 at its close was proportionately smaller than the increase in the number of buses operated. This was a natural development, however, because a large majority of the railways situated where buses can be used to advantage had already undertaken bus operation at the beginning of the year. Because of operations carried on jointly with other railways, however, and because operations sometimes are carried out by holding companies in the name of their subsidiaries and in other instances by subsidiaries in the name of holding companies, the total number of railways operating is more a matter of opinion than of exact calculation.

Among the railways now operating buses which were not so listed a year ago are the Chicago Surface Lines, Washington, Baltimore & Annapolis Electric Railroad, Central Passenger Railroad at Atlantic City, N. J., New York and Stamford Railway, Poughkeepsie & Wappingers Falls Electric Railway, Oregon Electric Railway and Levis Tramways. The Reading Transit Company reappears on the list after having been dropped when bus operation was discontinued some time ago. The Louisiana Electric Company at Lake Charles and the Shawnee-Tecumseh Traction Company in Oklahoma discontinued all rail operation and now operate only buses.

A number of companies which reported bus service a year ago are no longer on the list. The Waterbury & Milldale Tramway sold its buses to an independent operator, but continued its rail operation. The New Bedford & Onset Street Railway suspended all operation and bus service is now furnished by an independent agency. The Menominee & Marinette Light & Traction Company sold its bus equipment, as did the Philadelphia & Western Railway. The Mesaba Railway in Minnesota sold its buses to the Northern Pacific Railroad. In Canada the Windsor, Essex & Lake Shore Rapid Railway discontinued its bus operation altogether.

Nearly 3,200 miles of extensions were made last year to the bus route mileage of the electric railway systems. This was the largest increase in any recent year. Intercity bus route extensions were made by 53 electric railways and amounted to 2,840 miles. This was greatly in excess of the intercity bus route mileage added in 1926, which was only 1,830 miles. City bus extensions were made by 82 electric railways totaling 560 miles. This was somewhat less in 1926 when city bus route extensions totaled 840 miles.

From the foregoing figures it will be seen that the gross increase in route mileage for the year was approximately 3,400. Slightly more than 200 miles, however, was reported as having been abandoned during the year. Eighteen electric railways found it advisable to

* Sightseeing or touring.

discontinue certain bus routes or parts of routes for various reasons, usually because of lack of adequate patronage to make the line profitable.

Adding the net increase of 3,200 miles to the 15,000 miles of bus route operated by electric railways at the beginning of the year a total mileage of considerably more than 18,000 is indicated today. Of this total, however, only a comparatively small amount represents replacement of electric railway service. The cumulative total of track on which car service had been replaced by bus service was 1,400 miles on Jan. 1, 1927. During the past year bus service replaced car service on approximately 470 miles of track, making the present total of track which has been abandoned in favor of the bus about 1,900 miles.

Other automotive equipment bought during the past year totaled 207 vehicles, including freight and express trucks, service trucks, tower trucks, dump trucks and snow handling equipment. For 1926 this total was 347. The biggest purchaser of automotive service equipment in 1927 was the Milwaukee Electric Railway & Light Company, which bought 40 such vehicles. The British Columbia Electric Railway purchased 23 vehicles, including freight and express and service cars, the Boston Elevated bought 17 vehicles and the Public Service Railway sixteen.

Digitized by Google

$39,676,000 of Bonds Placed

Bulk of financing was done by city systems at prices that compare favorably with those to other borrowers under present conditions. Maturities for year much lower than for 1927

WITH one exception the financing done in the electric railway field in 1927 was for amounts running into large figures. The outstanding issue was, of course, the offering of $18,000,000 of Twin City Rapid Transit Company first and refunding 5½ per cent gold bonds, placed with investors at a price to yield about 5.70 per cent. Next in importance in the order of size came the Cincinnati Street Railway issue, placed in April with investors at an even 5 per cent yield. Next in size came the two Boston issues, one for $4,626,000, placed in January, to yield 5 per cent, and the other for $1,885,000. placed in April, to yield 4.936 per cent.

The $2,000,000 Omaha & Council Bluffs Railway & Bridge issue was placed in November, to yield 6 per cent. The Chicago Rapid Transit issue of $1,795,000 was placed in May, to yield 6.565 per cent. The Denver Tramway issue of $1,750,000, placed in March, to yield 6,304 per cent, and the Philadelphia Rapid Transit Company equipment trust issue, placed in February, to yield 5 per cent, were somewhat different in character from the others. The total of $39,676,000 was greatly in excess of the total for the previous year, as the nine-year comparative record shows. That record also shows that the preponderance of the financing was done by the large city companies. Of course, there were some issues smaller in size that are not included in the table, which only shows amounts of $500,000 publicly offered. Their inclusion, however, would not make any material difference in the total. All the issues were placed at an average yield to the investor of approximately 5.5 per cent.

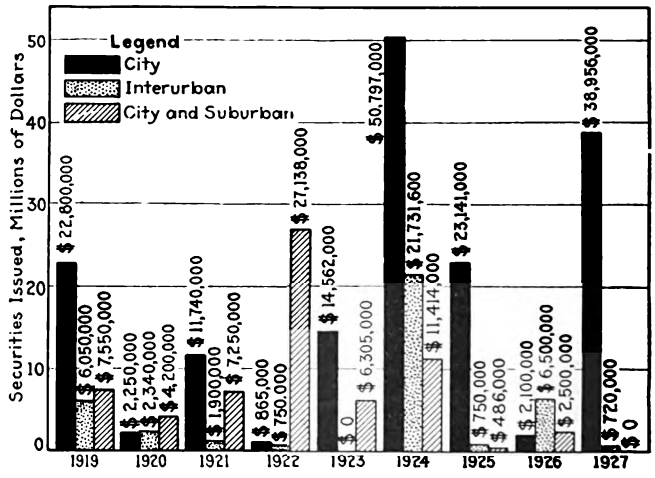
Table I—Nine-Year Record of New Electric Railway Financing Involving Bond or Note Issues of More Than $500,000

	City Railway	Interurban	City and Suburban
1919	$22,800,000	$6,050,000	$7,550,000
1920	2,250,000	2,340,000	4,200,000
1921	11,740,000	1,900,000	7,250,000
1922	865,000	750,000	27,138,000
1923	14,562,000	.....	6,305,000
1924	50,797,000	21,731,600	11,414,000
1925	23,141,000	750,000	486,000
1926	2,100,000	6,500,000	2,500,000
1927	38,956,000	720,000	0

Maturities for this year are way below the figure for 1927, being $47,577,200, compared with $180,798,000 in 1927. Of this $47,577,200 the two Omaha issues account for $10,918,000 and the two Minneapolis issues for $15,000,000. One of the Omaha maturities has already been arranged, and the Minneapolis issues are taken care of by that company's recent financing. This leaves a total of only a little more than $21,000,000 of maturities to be arranged in a period of easy money.

The amount of bonds in default has increased materially during the year, being more than $260,000,000, compared with more than $180,000,000 during the previous year. This is accounted for largely by the various Chicago issues, totaling more than $85,000,000. The interest on these issues is being paid, but the bonds were not refunded because of the failure of the city of Chicago to work out a new operating arrangement with the railway. In the table in which this subject is covered there is a default as to principal as well as to interest only where the maturity date appears after the issue. Technical defaults are not included in this tabulation.

This year it has been possible, with the aid of the American Electric Railway Association, to publish an additional table showing the disposition which was made of the issues that matured during 1927. The column which records the information that was available is self-revealing. It is significant in its showing of issues retired. Some of the large issues were refunded, and there appears to have been little trouble in negotiating this outcome or in arranging for the extension of the issue where that was deemed desirable. As a matter of fact, eighteen of the issues maturing were retired, against less than a dozen issues either refunded or extended. It is significant that the issues that were retired totaled more than $6,000,000.



The securities issued for electric railway properties last year reflect the large amount of refinancing necessary

One of the most interesting events of the year was the readjustment of finances by the Grand Rapids Railway as a result of which that company was succeeded by the Grand Rapids Railroad. It will be recalled that a plan of readjustment was suggested for the Grand

Table II—Comparison of Maturities in the Electric Railway Field

1928	$47,577,200	1923	$94,851,800
1927	180,798,000	1922	160,015,860
1926	26,644,790	1921	207,617,530

Rapids Railway, Grand Rapids, Mich., which contemplated the organization of a new company to take over the assets of the old company and the cancellation of all of its common stock and extinguishment of $600,000 of its indebtedness through the issue of common stock of the new company, and the exchange of preferred stock on the basis of two shares of new company common stock for one share of old preferred stock, the depositors of which were also offered subscription rights. The plan also provided for the authorization of additional preferred stock by the new company to provide funds further to reduce existing indebtedness and for other corporate purposes. It was explained that the changes suggested were deemed advisable at the time because

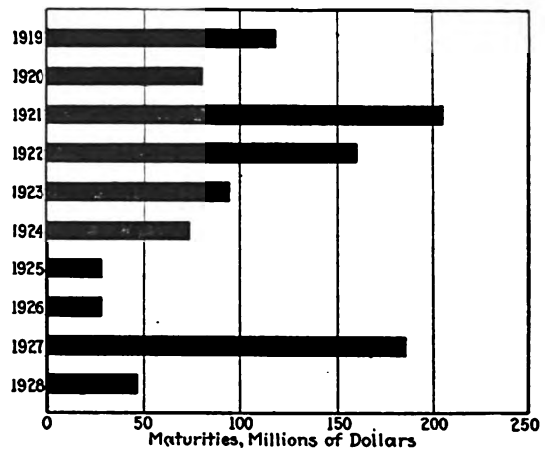
Total				$39,676,000

of the large floating indebtedness of the old company and its lack of a medium for doing any financing other than through first mortgage bonds which could not be issued and sold in sufficient amount or at advantageous prices in view of the company's condition. The former floating debt position dated back to June 1, 1919, when three-year bonds amounting to $3,700,000 became due, which bonds were in turn isued to refund the long term 5 per cent bonds originally issued in 1900. The details of this plan were reviewed in the ELECTRIC RAILWAY JOURNAL for April 16, page 718.

Progress is also reported on the plan of readjustment of the capitalization of the many companies comprising the Pittsburgh Railways system intended to bring all of these properties into the ownership of one company with a simplified financial structure. It is hoped that some definite workable arrangement will develop in the near future.



In 1928 there will be a material reduction in maturities following the unusually large number last year

Table VI—Outstanding Electric Railway Bonds in Default of Interest

(Compiled by Dow, Jones & Company)

Only a Mint

Doesn't Need to Merchandise

There are no dusty answers here. A new day is being greeted in a new way by the railways in the work of finding the open sesame to the future

By G. J. MacMurray
News Editor *Electric Railway Journal*

KIN HUBBARD was all wrong. It's not so difficult to write a recommendation for some one you know. As a matter of fact, this industry is like the tea kettle. It may have been up to its neck in hot water, but it has continued to sing. And its song is not the song that *Liberty* thought it was. Nor is it by any means the song that Mr. Chrysler sang when he wrote "The Trolley Car Is Doomed" in *Collier's* for July 16. He and the others who have sprung to the bedside of the electric railways, fountain pens in hand, ready to write the obituary of this industry are to be forgiven for their absurdities. They need to be reminded that a shrill note from the whistle of a peanut wagon can always be counted upon to cause a stream of people to turn their heads as they rush along the street.

Returning to a study of this industry after a year's vacation, my curiosity was at first mild, but after I'd looked over statistics put out by Messrs. Storrs, Murphy and Dell, had sat down with Mr. Wickwire's little brochure "The Autobiography of a Thin Dime," read the speeches made at Cleveland and gone through 2,342 pages of the JOURNAL for 1927 the matter became scientific and intense. So, scientific and intense we are for the moment.

The revenue passengers carried during the first nine months of 1927 by 217 companies which report monthly to the American Electric Railway Association vary from 1.44 per cent increase in January to 3.85 decrease in July. For the whole nine months there is a decrease of 0.7 per cent.

Prof. Albert S. Richey's figures for street railway fares and electric railway materials and wages appear elsewhere in this issue. The fare tendency has been upward in recognition of good service, the national average being 8 cents. Some 116 major cities in the United States have a 10-cent cash fare. This group represents a large majority of the nation's mileage.

As if that were not enough in the way of figures to give this recital an authoritative touch, Freddie Dell, whose diet is figures, "conventionally speaking," supplied the statement on the next page just before he left on Jan. 3 for a vacation in Havana.

Digitized by Google

These are merely high spots. They are almost as succinct as the reply of the little boy at school who when asked to tell who Patrick Henry was and what he did, replied that "Patrick Henry was a young man and he lived in Virginia. He had blue eyes and light hair. He was married, and he said: 'Give me liberty or give me death.'"

The Biggest Room Is the Room for Improvement

Well, anyway, the electric railways are finding out that the biggest room in the world is the room for improvement. It is not all sunshine and roses, but the best news is that many properties, small as well as large, with few exceptions are coming back. Look at the moderate-sized properties, other than Grand Rapids, which entered the contest for the Coffin Award. Consider Little Rock! Take a look at Durham! St. Louis came out of receivership. The Chicago, North Shore & Milwaukee Railroad again hung up new records. In Chicago 1,574,969,902 people rode the Surface Lines in a year. As for the reorganized Cincinnati, Hamilton & Dayton road, the balance remaining for that property after fixed charges and depreciation was 55 per cent in excess of the estimates made by the reorganization committee. Pittsburgh also did well despite a decrease of $113,998 in gross earnings for the year due to the economic situation there.

The Convention Record Reduced to Figures

Year	Convention City	Convention Registration	Number of Manufacturer Company Members	Number of Exhibitors at Convention	Total Space Sold, Square Feet
1916	Atlantic City	3,271	208	125	57,229
1917	New York	Conference only	171	No exhibit	No exhibit
1918	New York	Conference only	171	No exhibit	No exhibit
1919	Atlantic City	3,166	206	157	62,219
1920	Atlantic City	3,300	200	136	59,529
1921	Atlantic City	1,189	225	No exhibit	No exhibit
1922	Chicago	4,200	244	141	61,895
1923	Atlantic City	4,404	274	162	75,681
1924	Atlantic City	5,804	330	192	86,349
1925	Atlantic City	7,147	371	204	100,030
1926	Cleveland	8,623	423	271	114,797
1927	Cleveland	8,024	445	293	116,634

Money Is a Boomerang; Turn It Loose

Best of all, the electric railways are learning that money is a boomerang. To go over all rehabilitation programs would be impossible. Aside from the program of the New Haven for its Springfield and Worcester properties, there was the rehabilitation of the South Shore Line, the completion of the $4,000,000 job of electrifying the Bay Ridge division of the Long Island Railroad, the $1,500,000 expenditure of the Cincinnati, Hamilton & Dayton Railway, the extensive program of the Cincinnati Street Railway, the $175,000 cut-off of the Milwaukee Electric Railway & Light Company, the work on the properties at Norfolk and Williamsport and the $680,000 program at Minneapolis, not forgetting the $3,000,000 program for Kansas City, all in the way of special expenditures. Certainly no shop installation exceeded in magnitude that of the B.-M. T.

The instances cited do not, of course, run the gamut of all the work done, but they indicate the willingness of the companies to spend money in order to make it. Detroit will not get its downtown dips, but there is no telling about the billion dollar plan of Henry A. Blair to develop and co-ordinate the surface cars, elevated lines and buses in Chicago. The new plan of rapid transit in northern New Jersey has been advanced, and co-ordination has been recommended for St. Louis and rapid transit for Cincinnati under the Beeler plan. Engineer Smith sees waste in the building of city-owned lines in New York City and suggests a fare increase with a unified system, but Samuel Untermyer wants New York City to recapture the lines built with city money but privately operated so as to tie them into the new lines being built by the city. In the matter of transit Mayor Walker and Comptroller Berry have stopped calling each other names.

Some progress has been made on the plan to have the Public Service Company of New Jersey use the old canal bed in Newark. The $12,000,000 Dorchester Rapid Transit extension at Boston was placed in service and Rochester's new rapid transit line was opened. Again, at Boston there was unusual interest in the plan of the Wells interests to take over and electrify the narrow-gage line. M. M. O'Shaughnessy, city engineer of San Francisco, told about the $3,500,000 expansion program for the municipal system with track extensions totaling 11.6 route-miles and 47 additional cars and 26 buses. J. Rowland Bibbins contributes to the history of the year with his article "Problems of Mass Transportation" in the issue for April 23 and with his recommendations for Philadelphia. Also in Philadelphia Expert Simmons advised an agreement for Broad Street tube operation only and Dr. Snow suggested the expenditure of $77,000,000. The program of the Piedmont & Northern for carrying out its $50,000,000 expenditure has been frowned upon by the I. C. C. examiners, but that case is not yet off the docket.

Municipal Operation No Panacea

San Francisco's municipal road is having hard sledding and Seattle doesn't seem to know whether it is coming or going. As for the Detroit Municipal system, it is in the cards that something heroic in the way of fare changes must be done soon.

In Chicago political bickering prevented the consummation of a new franchise deal and the whole matter is again the subject of conferences. One cannot pass the wonderful record of the Surface Lines without mentioning that the men there, comprising the largest labor local in the industry, reminded fellow unionists of other trades that nothing was to be gained by idle baiting of the railways.

Kansas City got a new franchise, but the situation in Toledo is still unsettled. The value of the St. Louis properties has been fixed at $58,157,236 and the company has come out of receivership, but the franchise matter remains to be settled. The question of renewing the Boston Elevated agreement for operation under public control is now before the Legislature.

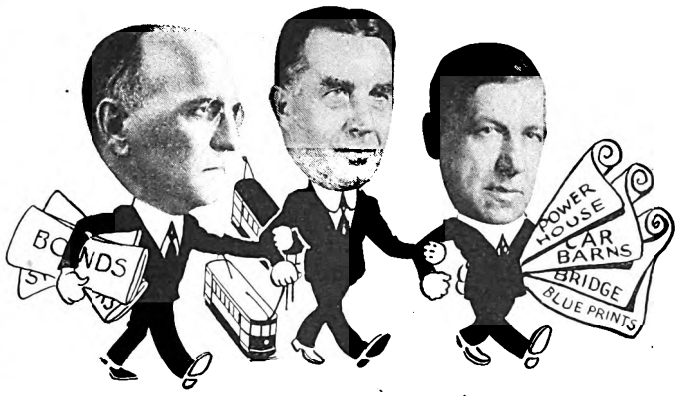
Note the "Axe" in Taxes

Among the paving relief measures was the one passed in New Jersey. The issues it was expected the so-called O'Fallon case would settle still remain undecided, but as William A. Prendergast of the New York State Commission pointed out in a paper before the annual convention of the Railroad and Utility Commissioners held in Dallas, Tex., the courts have ruled that the cost of reproduction shall be recognized as the present value and should be so accepted. The burden of taxation that the railways bear was made plain by Leslie

Digitized by Google

Vickers, economist of the association, at the hearing in Washington before the ways and means committee, in which he brought out the fact that one cent of revenue out of every ten of the railways goes for taxes. This recalls the fact that every evil contains the germs of its own destruction.

The year closed with Sam Greenland responsible operating head of the system in St. Louis and Jack Shannahan at Omaha, with the problem facing him of securing a new franchise and restoring to popular favor a road that has long been the goat for local politicians. Mr. Sawyer joined Stevens & Wood under an arrangement that gives him wider scope for the exercise of his talents and fortifies that firm by the accession to its forces of a man unusually well equipped as a utility expert.



A smooth-working triumvirate

Soothing the Passengers' Nerves

As for the technical arts, this review is not intended to cover them. Suffice it to say that the improvement of cars still holds its place in the limelight. The bumps are being taken out of track on a wholesale scale and the battle between wood and steel for ties goes merrily along in the competition to give the passenger a smoother ride. If the process of soothing the passenger to relaxation continues, we shall next be faced with the need for alarm clocks to wake them when they reach their corners. There appears to be much interest in the automatic rectifier substation, noise prevention and our old friend rail corrugation. Pull-ins are still being pulled down and better snow-fighting methods are preventing hold-ups of service. No longer is it true of service that the man who decided to commit suicide by lying on the track starved to death before the car came along.

The Journal spurred writers on by its Maintenance Article Contest and preached amusing sermons by its cartoon, "Adventures of Old Man Trouble of the Hicksville Railway," while the writer of the Dick Prescott sketches appears to be just as prolific as ever. Moreover, there was the notable series of articles on foreign practices written by Henry W. Blake, which served to expand the limits of electric railway thinking beyond our own shores.

In equipment there have been corresponding improvements, and in city service, where $1\frac{1}{2}$ to $1\frac{3}{4}$ m.p.h.p.s. used to be considered good acceleration, motors capable of giving 3 m.p.h.p.s. are thought desirable. The earliest radical departures in equipment were in the construction of cars for the Springfield Street Railway and by the Chicago & Joliet Electric Railway with worm-gear drive. At the Cleveland show there blossomed forth an array of new ideas in cars, trucks, buses and equipment that jolted the industry to a sudden realization of the speed at which we are moving. Thus through a gradual process of evolution transportation has entered the product class along with soap and candy. The public, ever receptive to something good, is beginning to have its attention directed to transportation as a product highly satisfactory from the standpoint of economy, convenience and comfort.

Newspaper advertisements show the great advance in thinking that is being made in the direction of selling the service of electric railways. Many of these efforts had strong rider appeal; others were directed to the consideration of economy in railway riding. But the important thing is that the copy is being written to sell a product. Just as the production of an artistic poster presupposed the hiring of a real artist, so electric railways are coming to see the need for advertising copy writers with skill, imagination and understanding of crowd psychology. As Fred Erickson, advertising manager of the Milwaukee Electric Railway & Light Company, puts the railway advertising story, "Keep on telling it in such a manner that the public knows about it and believes it. That is the secret back of advertising the transportation business." Still, some men in the railway business are as obdurate about the value of advertising as was the jeweler who did not wake up to the fact that advertising brings results until he advertised for a watchman and discovered the morning after the ad had been run that his shop had been ransacked by burglars.

Omaha gave Mr. Shannahan a royal reception

Ride the Trolley Week

In Pittsburgh ride merchandising has developed a wide range of ingenuity, extending from cut rate and special short fares to the inauguration of a "ride the trolley" week. So well have they done their work

Digitized by Google

there that a story comes from Pittsburgh that a flapper rode the cars all day because she misinterpreted a dash sign which read "The Loves of Carmen."

The importance of the movie in advertising railway service is evidenced by the activity of the American Electric Railway Association in arranging for the preparation and national distribution of ride-selling films. Of course no such stars as Greta Garbo and John Gilbert are to be shown unless perhaps they wish to indorse a de luxe safety car in preference to a Rolls Royce. How effective an advertising medium the movie really is was proved in Providence, R. I., recently when many people crashed the gate to see the picture "East Side, West Side, All Around the Town," presented by the railway. This ingenious version of the plight of the private automobile owner reminded one of Eugene Field's line about the German railroad train: "Fool that I was, I should have walked; I had no time to waste."

Trainmen Develop Potential Riders Into Actual Customers

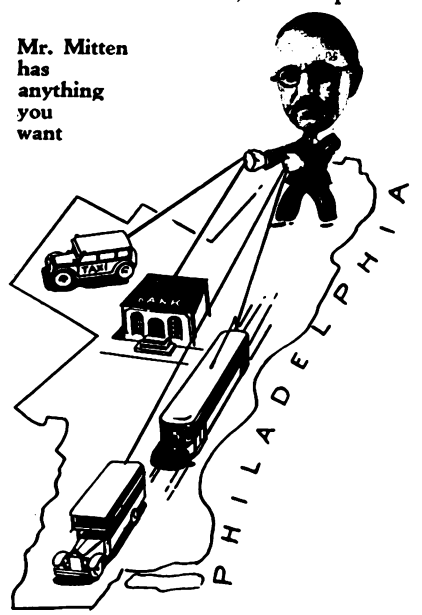
Now these things are not inconsequential. Service must be sold and sold again. As a writer recently put it in the little poem "Secret of Service":

We may lay a splendid trackway,
We may build the finest cars,
Install the best equipment
To eliminate the "jars."
We may furnish every comfort
that the mind of man conceives;
Even issue scented transfers
On æsthetic gilt-edged leaves,
But to give you all real service,
That is service with a "throb,"
We must look to our street carmen
To be always on the job.

In the final analysis, trainmen are largely responsible for developing potential riders into actual customers. Prospect cards were resorted to by the Pacific Electric Railway, Winnipeg Electric Company and Elmira property whereby employees directly solicited new business. The thousand and one little touches that appeal to customers were pretty broadly employed by the various railway properties. In Evansville the company followed the practice used by Grand Rapids, Atlanta, Knoxville and other cities of naming the cars after the first settlers. In Cincinnati new insignia appeared on all the cars. An open house was held in Williamsport, Pa., and carnations were distributed to the ladies.

On this subject of actual customers Mr. Lemmon, of Stone & Webster, said: "Unless we know more about the other fellow's needs than he does and can point them out to him there is no reason to suppose that he will part with real money until he has become aware of his requirements."

Whether the utility plan of advertising included entertaining the Prince of Wales, as the International Railway did in Buffalo, or engaging an English economist to look into the inner workings of the employee ownership scheme existent in Philadelphia, or whether it was a trick of showmanship like the bonfire and civic celebration with which the Cincinnati, Hamilton & Dayton Railway introduced its new service, it is impossible



for this commentator to say. Long before the Coffin Award was to be made car riders in Grand Rapids knew that their vicinity was vying for honors with other cities throughout the country; civic pride was, therefore, aroused, and they awaited the outcome of the competition just as thousands awaited the new Ford model.

Progress With the Bus

Speaking statistically again, the Public Service Corporation of New Jersey holds the record for passengers handled on buses. On that system in 1926 199,640,564 passengers were carried by bus, compared with 397,690,310 passengers transported by trolley. Perhaps one of the most important bus developments of the year was the use of the bus for local hauls and the trolleys for long hauls in Detroit. This is an experiment that has attracted wide attention. And don't forget that T. E. Mitten had something very worth while to say during 1927 in his interview, "Three Classes of Service."

In New York City the Board of Estimate granted a number of franchises for the operation of buses, but the grants have still to be certified as to their conveniences and necessity by the Transit Commission. Among the de luxe and sightseeing tours were those started by the Cincinnati Street Railway. The Twin City Rapid Transit Company went into the taxicab business in January. One of the most important situations to be righted during the year was at Indianapolis, in which city the Indianapolis Street Railway took over the Peoples Motor Bus Company.

Many Sterling Papers Presented at Meetings

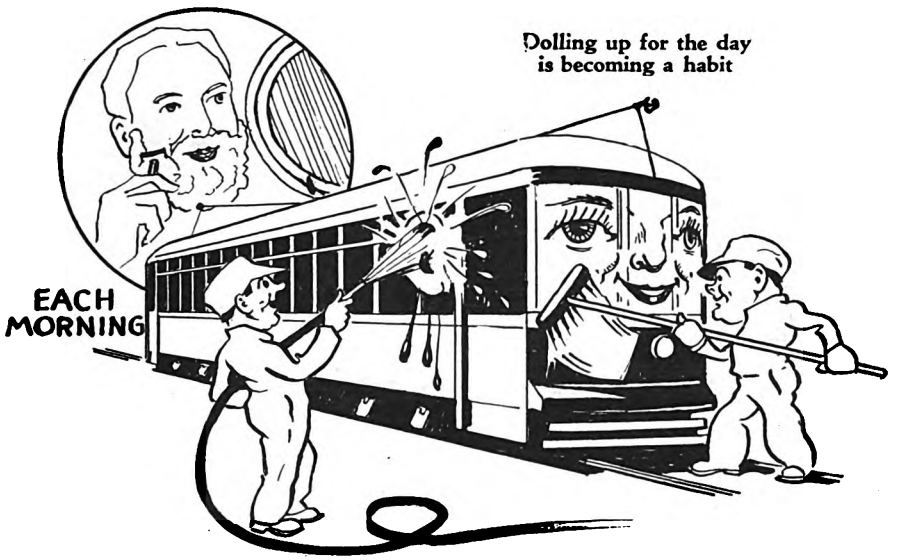
The palm for papers on bus operation goes to R. N. Graham for his excellent presentation before the Metropolitan Section, Society of Automotive Engineers. Close behind Mr. Graham in the importance of the papers presented on this subject came A. J. Brosseau, with his address at the meeting of the Bus Division of the American Automobile Association in Philadelphia; Clark T. McConnell, B. W. Arnold and Mr. Noonan of Pittsburgh.

There was certainly no dearth of good papers at the meetings during the year. It is not extravagant to say that the Cleveland convention was the most fruitful one yet held, but at all the sectional meetings, with possibly one exception, the spirit reflected was the one that is putting the industry back on its feet. President Sawyer traveled the length and breadth of the land, and his remarks at the sectional meetings did much to bring home to his audiences the need for keeping everlastingly at the problem. As Mr. Sawyer repeatedly said, this is a new day, and as Charlie Gordon put it, "You Can't Sell Cotton Goods in a Silk Age." At the Oklahoma meeting Mr. Storrs said the fact that the industry has come back to render the excellent service that it does today proves conclusively the essentiality of it and also the measure of the men engaged in it.

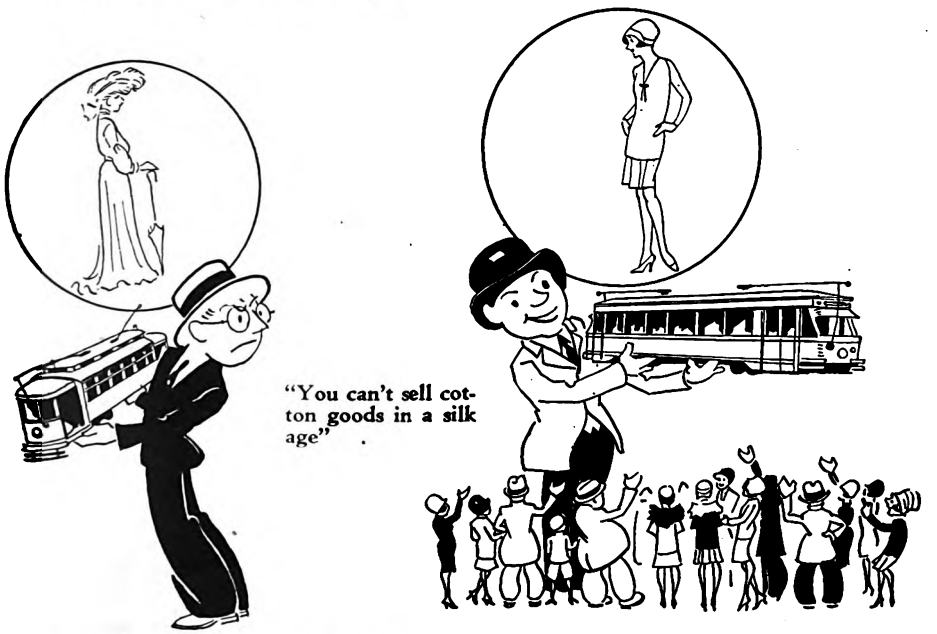
Perhaps no year was more conspicuous than the past for the accomplishments in the development of de luxe equipment. The car of the future will no longer symbolize merely utility but rather utility plus art. Industrial art is fast reaching the plane of the Fine Arts. Witness the Kansas City Public Service Company adopting a color scheme for cars

Digitized by Google

as submitted by the Municipal Art Commission. Imagine the residents of El Paso some years back gazing upon chrome yellow and Yale blue on their electric railway equipment. This super-decorative idea follows closely the psychology of the new Ford school of thinking, which is conscious of the general change in habits and ways of living and has come to believe that a vehicle that merely takes you there and back has long since outlived its usefulness and now must be replaced by a vehicle that takes you there and brings you back in style. Of course, extremes are to be expected. In that respect some of the cars are like the short skirt. They may be in bad taste, but they often show good form.



And so the trend runs. To recapitulate the record of new cars here there is no need. Suffice it to say that in Atlanta and other cities where car and general rehabilitation programs have been carried out the officers of the companies resorting to these means of keeping abreast of the times have not been disappointed with the amount of recognition such efforts have received at the hands of the regulatory and other public bodies. New equipment saved the Eastern Massachusetts Street Railway $1,528 per car a year. New equipment is also playing a big part in the comeback of the reorganized Cincinnati, Hamilton & Dayton Railway.



"You can't sell cotton goods in a silk age"

As H. G. Holtzclaw put it:

"We have two primary incentives for improvement—first, to get back some of the business which we have lost, by giving our patrons a clean, comfortable, attractive vehicle to ride in; second, building up in their minds the feeling that their street railway company is trying to provide the public with good facilities, the psychology of which is that when the time comes for you to ask the public to give you more revenue, you will meet with a ready response and a wholesome co-operation rather than the swift kick which has so often been the lot of the poor railway."

And it isn't so expensive to keep cars up, as Pierre V. C. See of the Northern Ohio Power & Light Company showed in his article "Keeping Cars Attractive at Small Cost" in the JOURNAL for June 11. Pittsburgh led the way in keeping cars clean and attractive at small cost by putting in automatic electric washing and scrubbing apparatus in its carhouses. All this effort to keep cars presentable is in strange contrast to the remark said to have been made not so long ago by the manager of quite a large city system who rides his own cars:

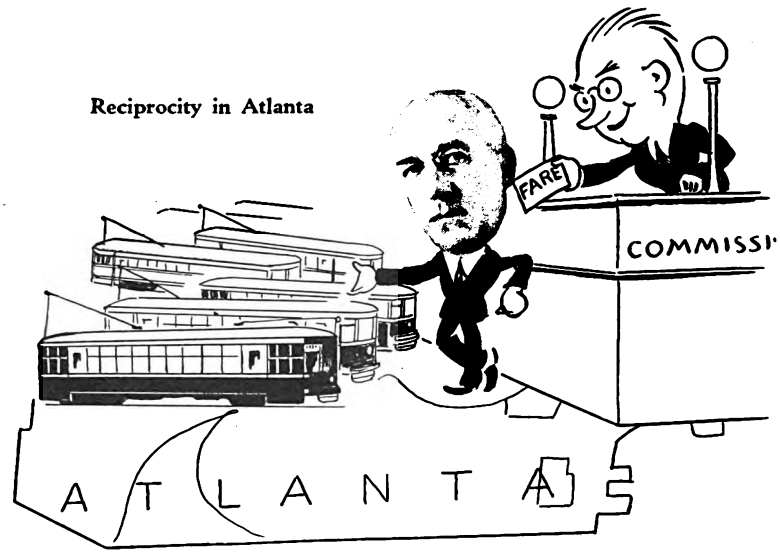
"I saw a car with clean windows today and when I got back to the office I raised hell to find out who cleaned the windows and spent all that money."

G. W. James, Jr., after a study of the electric railway car situation was moved to poetry in the Convention Daily and epitomized the car situation in the following lines:

Ten old street cars
Drawn up in a line;
Along came the treadle car
And then there were nine.
Nine bum street cars
On the siding wait;
Progress said "Streamline"
And then there were eight.
Eight old street cars,
Ought to be in heaven;
One fell to pieces
And then there were seven.
Seven old street cars,
One was full of nicks;
People wouldn't board it
And then there were six.
Six bum street cars,
Owners not alive;
One smashed through faulty brakes
And then there were five.
Five old street cars,
Hard slat seats of yore;
"Leather," "Plush" and "Kemi-suede"
And then there were four.
Four noisy street cars
As jumpy as a flea;
Along came the "worm drive"
And then there were three.
Three weighty street cars
Always lumbering through;
Some one cried "aluminum"
And then there were two.
Two shoddy street cars
Laughed at on the run;
Motor fell to pieces
And then there was one.
One punk street car,
Knew its day was done;
Some one yelled "piece of junk"
And then there was none.

Now, good transportation with suitable cars presupposes adequate fares. Houston, Buffalo and Atlanta were among the cities that went to a cash 10-cent fare, while Baltimore seeks

Digitized by Google



Reciprocity in Atlanta

that rate. The spread of the 10-cent fare idea is illustrated by the fact, noted before, that there are 116 cities of more than 25,000 population in the country with this basic rate.

No Vehicle Superior to Trolley

For moving large numbers of persons the superiority of the electric car remains undisturbed. Thus, a survey of traffic conditions in Chicago, made public in January, 1927, showed that of the 1,693,506 people riding in or out of the central business area 62.4 per cent used the street cars or elevated, 13.1 per cent the steam railroads, 5.3 per cent the buses and 19.2 per cent private automobiles. The details of the story gleaned from the traffic survey in Chicago were contained in several articles in the JOURNAL, the first of which was run in the issue for Jan. 8. The automobiles were responsible for more than seventeen times as many accidents as the street cars. In Detroit it was estimated that the annual economic loss through traffic congestion and delay is more than $30,000,000, and H. M. Gould points out that that city is less than 50 per cent efficient in the use of its streets.

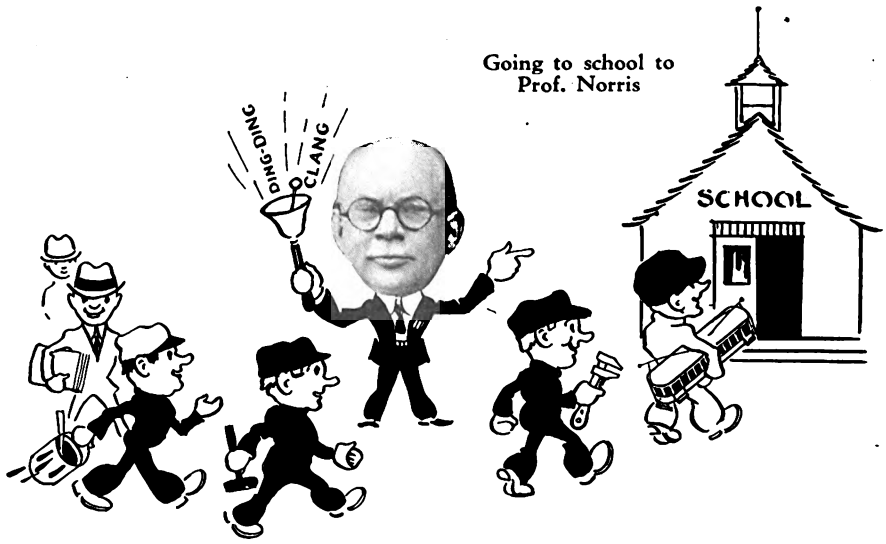
A Wise Old Gentleman Talks Safety

By means of slogans, safety campaigns, prizes and bonuses for no-accident records the men in the railway business and their managements are impressing riders and pedestrians alike with the need of an intelligent and sympathetic understanding of the safety movement. While Aunty Jay Walker was forbidding here and there, Mr. Will Livelong had stop-over privileges in Philadelphia for the month of April. Every agency, association and organization listened to this wise gentleman's admonitions on reducing accident hazards in the streets. New Orleans celebrated a 100 per cent safety day and the New York State Railways celebrated the fact that ten employees operated 240,000 miles without an accident. Chester K. Thomas of the Chicago, North Shore & Milwaukee Railroad advocated popularizing safety work. J. H. Handlon suggested studying safety more closely, particularly investigating the accident breeding habits of employees. The Monongahela West Penn Public Service Company decided during the year just ended to devote at least one page of *Courtesy and Service,* its official publication, to news of safety. In Brooklyn operators with no-accident records were awarded cash considerations as well as watches, and on many other properties there were prizes of one kind or another intended to make employees safety conscious in their daily duties. At all times the idea is to make the safety slogan short in preachment but long in practice.

But after all, safety, like merchandising, depends upon the interest, training and education of employees. Rapid progress is being made in equipping transportation men not only for their jobs but in getting more out of life. Bus operators in Akron, Ohio, are graduated *summa cum laude,* and 2,300 employees of the Philadelphia Rapid Transit Company enrolled in classes for practical instruction, while their leisure time is often spent among the 6,000 books and 150 periodicals of the company's library.

Education is handled intensively in Boston, where Professor Norris directs a program which includes courses in public speaking, fabric painting, events of the day, law and investing savings. Dr. Rowland, in Milwaukee, likewise is pointing the way to widened opportunity for utility employees through a variety of self-improvement courses.

After all, no industry can rise above the intelligence of the men who are engaged in it. As they sow, so is the industry of which they are a part. To go back to Mr. Chrysler, let it be said that something is brewing, but it isn't trouble, not at the present pace in the railway industry. All depends, of course, on where the emphasis is placed, like the skipper who wrote in the log, "The mate was drunk today." The mate said, "Is that necessary?" The captain responded, "It's true, isn't it?" "Yes," answered the mate. "Then it stands," replied the captain. Next day it was the mate's turn at the log and he wrote, "The captain was sober today." When the captain saw it he asked, "What did you put that in the record for?" The mate said, "It's true, isn't it?" "Yes," said the captain, "it's true, but—" "Then it stands," replied the mate.



Going to school to Prof. Norris

Electric Railway

Costs and Fares in 1927

General commodity prices have dropped slightly during the year, followed by similar reductions in construction costs. Fares and wages show increases

By Albert S. Richey
Electric Railway Engineer, Worcester, Mass.

DURING the past several years, in its Financial and Corporate section, ELECTRIC RAILWAY JOURNAL has presented each month a series of index numbers compiled by the writer under the heading "Conspectus of Indexes." This conspectus is made up of indexes showing the trend of street railway fares and of the costs of electric railway wages and materials entering into electric railway operation; costs of construction, both electric railway and general; wholesale commodities in general; retail food; cost of living, and some others. In the Annual Statistical Numbers of the JOURNAL, the first issue in January each year beginning in 1923, charts and tables were presented showing the trend since 1913 of the most important of these indexes as affecting electric railway operation. In Fig. 7 herewith is shown a similar chart indicating the trend of five of these indexes from January, 1914, through the latest available figures for 1927. The indexes there shown are: (1) Wholesale prices of all commodities, as computed by the U. S. Bureau of Labor Statistics; (2) Electric Railway Construction Costs, as computed by the formula of the American Electric Railway Association; (3) Electric Railway Operating Materials Costs, including fuel for power; (4) Electric Railway Wages; (5) Street Railway Fares.

INDEX COMPUTED ON SAME BASIS AS IN PREVIOUS YEARS

The methods used in the computation of these five indexes were described fully on page 37 of the JOURNAL for Jan. 2, 1926, in an article which also contained a tabulation showing the numerical values of the various indexes monthly from January, 1920, through December, 1925. The earlier monthly numerical values, from January, 1914, through December, 1919, may be found on page 19 of the JOURNAL for Jan. 5, 1924. A tabulation herewith shows the numerical value of six of the indexes yearly from 1913 through 1927, and monthly beginning with January, 1925, and these six indexes also are shown graphically for the past three years on a somewhat larger scale than in Fig. 7 by the charts Figs. 1 to 6, inclusive.

FARES UP 2 PER CENT

The average street railway fare, as shown by Fig. 1, has increased during 1927 from 7.42 cents to 7.57 cents, an increase of 2 per cent during the year. Twenty-three of the 143 cities which affect this index reported increases in street railway fares during the year. The most important of these increases were in Buffalo, Syracuse, Rochester, New Bedford, St. Louis, Atlanta, Fort Worth, Houston and San Antonio. Other changes were of less importance as affecting the index, either on account of the smallness of the changes or the relatively small population involved.

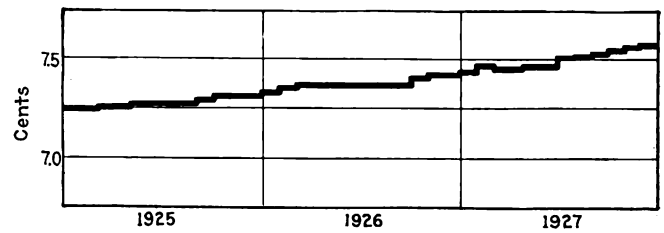

Fig. 1—Street Railway Fares (1913 = 4.8425 cents)

WAGES CONTINUE UPWARD TREND

The index of electric railway wages, as shown by Fig. 2, has continued its gradual upward trend which started in 1923. This index showed a slight increase in almost every month of 1927 and now stands at 228.4, with a total gain of not quite 1 per cent since December, 1926. The principal increases in wages of conductors, motormen and car operators have been in Virginia, Baltimore, New York City, Eastern Massachusetts, Indianapolis and Boston. The present index number of 228.4 is comparable with 100 in 1913, the peak of 232 in 1920, and the low point of about 207 in the early part of 1923. The increase in electric railway wages, amounting to 128.4 per cent since 1913, is still out of all proportion to the increase in cost of living, which according to the National Industrial Conference Board had increased only 64.2 per cent between 1914 and November, 1927. The average index of the cost of living during 1927 being about 164, and the average index of electric railway

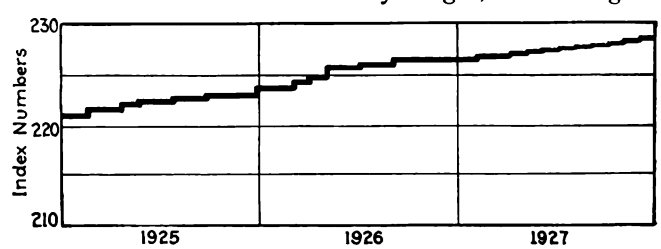

Fig. 2—Electric Railway Wages (1913 = 100)

Digitized by Google

wages being about 227, the "real wages" of electric railway trainmen, as compared with 1913 and 1914, may be represented by an index number of 138, which is the index of wages divided by the index of the cost of living. In other words, the average electric railway trainman in the United States now has the opportunity to increase his standard of living 38 per cent over that of 1914. It may be remembered that a similar computation a year ago showed the index of "real wages" of electric railway trainmen as 134, compared with the present index of 138. This indicates an increase in the "real wages," or opportunity to increase the standard of living, of about 3 per cent during the past year. This has been due in part to a slight increase in wages, as before noted, but in a somewhat larger measure, it is due to a decline in living costs during the past year.

Materials Costs Decreased

The cost of electric railway operating materials declined somewhat during 1927, as is indicated by the index which is shown for the past three years in Fig. 3. This index, which in December, 1927, stood at 140.6, was then at its lowest since its 1920 peak. It should be borne in mind

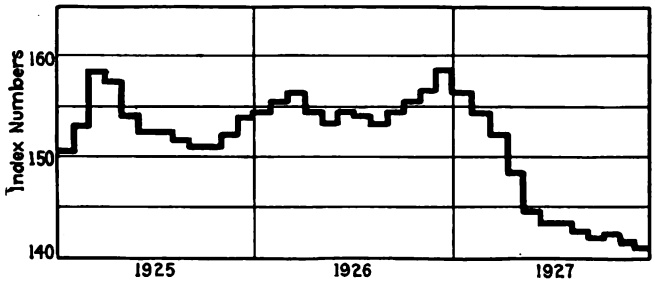

Fig. 3—Electric Railway Operating Materials (1913 = 100)

that in the make-up of this index, fuel for power enters into it with a weighting of 40 per cent. The decline of the index during 1927 was chiefly due to the falling off in fuel prices, although there were some recessions in its other elements.

Construction Costs Off Slightly

Electric railway construction costs showed a fairly steady falling off during 1927, with a slight gain in December, as is shown by Fig. 4. Compared with the average for 1926, 202.6, the index for December, 200.7, was about 1 per cent lower, and the average for 1927, 201.1, was three-quarters per cent lower. One of the principal constituents of this index is the common labor rate, which, according to *Engineering News-Record,* averaged 56 cents in the early part of the year, had declined to 54½ cents in October, and increased to 55 cents in December. The costs of various materials entering into electric railway construction, except those of steel rails and copper, also showed some decline during the year.

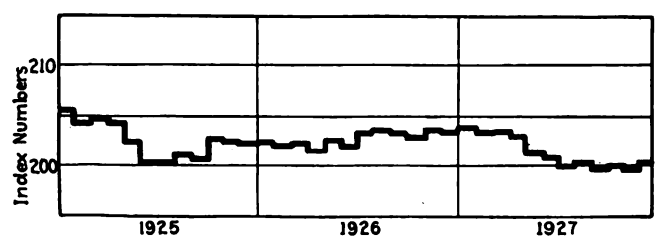

Fig. 4—A.E.R.A. Electric Railway Construction Cost Index (1913 = 100)

General construction costs, as indicated by the Construction Cost Index of *Engineering News-Record,* shown for the past three years in Fig. 5, showed a decline in 1928 somewhat greater than the Electric Railway Construction Cost Index. The various factors of structural steel, other building materials, and to a lesser extent common labor costs, which combined to bring down the Gen-

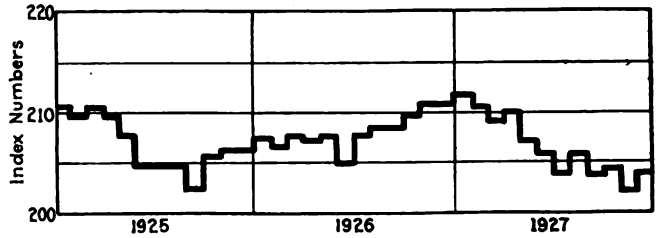

Fig. 5—"Engineering News-Record" Construction Cost Index (1913 = 100)

eral Construction Cost Index during the year, were practically the same as those which caused a similar effect in the Electric Railway Construction Cost Index. The latter, however, is stabilized somewhat by the heavier weighting of steel rail, the price of which has remained constant at $43 per ton since October, 1922, and also by the very much heavier weighting of the common labor item, which, as has been noted, showed a net decline of less than 2 per cent during the year.

Wholesale Commodities Down

The Wholesale Commodity Index of the U. S. Bureau of Labor Statistics is shown for the past three years in its revised form in Fig. 6. This index, which previously had been calculated on the base of 1913 = 100, was discontinued on that base in August, 1927, and since then it has been shown as revised to a base of 1926 = 100. The revision also included an increase in the number of commodities included (from 404 to 550), and the adoption of a weighting somewhat different from that previously employed. With these changes, the Bureau of Labor Statistics has published the revised index numbers

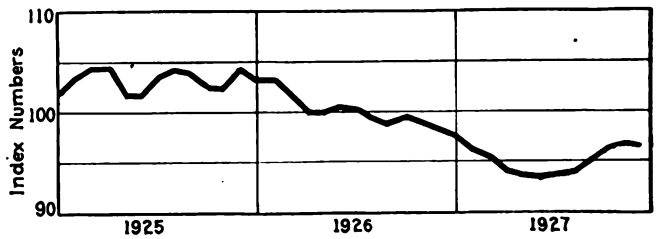

Fig. 6—Index of U. S. Bureau of Labor Statistics Wholesale Commodities (1926 = 100)

beginning with January, 1923, and these are shown in the line marked 1A on Fig. 7. The former series, ending in August, 1927, has been retained as line 1 in Fig. 7 and also in the accompanying tabulation, on account of its value in comparisons back through the years to 1913 and 1914 representing pre-war conditions. The Bureau states that it has in preparation a calculation of the revised index numbers which will carry them back to January, 1913, but until these calculations are made public it will be necessary to use the former series as here presented for such comparisons with years preceding 1923. Because a number of new commodities have been added to the series and others dropped, and the weighting of the various commodities has been changed, it is not possible accurately to join the revised series on to the

old by the application of a multiplying factor. From January, 1923, to December, 1925, and from January through August, 1927, during which periods both the old and new index numbers are available, the relation between the two seems to be about 1.53. The old series index number for the year 1926, however, was 151, and as the new series is on the base of 1926 = 100, this would indicate a relation of 1.51 between the two series. This indicates that an attempt to extend the old series forward or the new series backward by the use of a simple multiplier is likely to result in an error in the nature of 1 or 2 per cent.

Receiverships Reduced in 1927

With the exception of one year, the mileage of companies going into the courts was less than in any year since 1916. Many properties have been returned to their owners

GREATER stability of the industry than for a number of years is indicated from a study of the receivership record for 1927. For the first time since 1923 not one company of major importance was thrown into the courts. Only two companies with more than 100 miles of track were included in the list of new receiverships. These were the Chicago, South Bend & Northern Indiana Railway and the Des Moines City Railway. Contrasted with this, the United Railways of St. Louis, with more than 450 miles of track, was able to have its affairs straightened out and be discharged from the custody of the courts.

Mileage of electric railways in receivership on Jan. 1, 1928, showed a decrease of almost 13 per cent under Jan. 1, 1927. Seventeen companies, comprising 1,099 miles of track, emerged from receivership during the year. Thirteen companies, involving 624 miles of track,

(1) Sold at foreclosure.
(2) Sold at foreclosure and operations discontinued.
(3) Property now operated by Peoria Terminal Co. Receiver not yet discharged.
(4) Foreclosure pending.
(5) Property liquidated. Receiver not yet discharged.
(6) Sold at foreclosure in 1926.
(7) Operations discontinued December 31.
(8) Property being dismantled.

were placed in the receiver's hands, which is almost 50 per cent reduction from last year. Fifty-one companies, with 3,750 miles of track, are now in receivership, compared with 55 companies, with 4,307 miles of track, on Jan. 1, 1927, or a reduction of four companies and 557 miles of track.

In the amount of securities involved, the record for the year shows an encouraging situation. The total of fixed obligations of the companies entering receivership during the year was $20,875,450 and the total of stocks and bonds of all descriptions was $38,490,500. This contrasts with 1926, when $117,560,073 of fixed indebtedness and $135,329,508 of total capitalizations were forced to seek protection of the courts. The total reduction in 1927 in securities involved amounts to $96,071,446, or slightly more than 22½ per cent.

After many months of negotiations a new franchise agreement was reached in St. Louis. The St. Louis Public Service Company took over the properties of the United Railways and the Missouri Electric Railroad and the eight-year receivership of the two latter companies was terminated. The new company was organized in 1926 to buy the properties, but foreclosure sale was not effected until 1927.

The United Railways of St. Louis was the largest city property in receivership, with the exception of the Chicago Railways, which is not involved in financial difficulties. The expiration of the Chicago Railways franchise, as explained in the Statistical Number of Jan. 1, 1927, caused it to go into receivership as a protection to its bondholders. The railway is still operating on short-term extensions of two or three months, while negotiations are going on and legislation is being introduced to solve the problem of street railway operation in Chicago.

Three properties at Rockford, Ill., comprising more than 100 miles of track, sold at foreclosure in 1926, completed their reorganization in 1927 and are now being operated as the Rockford Public Service Company and the Elgin, Belvidere & Rockford Railway.

Receivers of the Oklahoma Railway, Oklahoma City, Okla., were dismissed on Dec. 16 and the properties turned over to the new owners, who immediately announced that rearrangement of the financial structure was under way.

In July service was suspended on the Kansas City, Lawrence & Topeka

Rockford & Interurban Ry., Rockford, Ill.	76.00	4,000,000	2,175,000	None	
Kansas City, Kaw Valley & Western Ry., Bonner Springs, Kan.	42.31	250,000	1,000,000	None	Sold at foreclosure sale and reorganized as the Kansas City, Kaw Valley Railroad.
Boston & Worcester Street Ry., Framingham, Mass.	83.00	2,482,200	2,520,000	None	Sold at foreclosure to the Boston, Worcester & New York Street Ry.
Mesaba Ry., Virginia, Minn.	38.00	2,260,000	1,581,000	None	Property dismantled and receiver discharged.
Grandview R.R., St. Louis, Mo.	15.00	(b)	(b)	(b)	Sold at foreclosure and property dismantled.
Missouri Electric R.R., St. Louis, Mo.	20.97	1,000,000	700,000	None	Sold at foreclosure sale and reorganized as the St. Louis Public Service Co.
United Railways Co., St. Louis, Mo.	436.32	41,296,000	52,590,000	None	
Portsmouth, Dover & York Street Ry., Portsmouth, N. H.	12.00	.....	707,000	$30,000	Receiver discharged. Property sold and dismantled in 1926.
Long Island Electric Ry., Jackson Heights, N. Y.	24.97	600,000	600,000	None	Receiver discharged. Property operated by Jamaica Central Railways, Inc.
Cincinnati, Georgetown & Portsmouth R.R., Cincinnati, Ohio.	54.00	1,500,000	1,000,000	None	Reorganized and receivership terminated.
Sharon & New Castle Street Ry., Youngstown, Ohio.	17.00	120,000	120,000	None	Sold at receivers' sale for scrap.
Oklahoma Ry., Oklahoma City, Okla.	138.45	5,595,900	5,815,000	.....	Receivership terminated.
Total of receiverships terminated (17 cos.)	1,098.82	$51,990,600	$71,755,000	$30,000	
Sold at Foreclosure Sale But Receiver Not Yet Discharged					
Washington-Virginia Ry., Washington, D. C.	40.00	2,378,300	5,614,000	None	Sold at foreclosure sale. Property now operated as the Mt. Vernon, Alexandria & Washington Railway and the Arlington & Fairfax Railway.
Chicago & Interurban Traction Co., Chicago, Ill.	50.00	1,000,000	1,816,000	None	Property sold and operation discontinued.
Kansas City, Lawrence & Topeka Electric Ry., Kansas City, Mo.	12.00	250,000	400,000	None	Sold at foreclosure sale. Operations suspended July 16, but negotiations now under way for resumption of service.
Morris County Traction Co., Morristown, N. J.	68.98	300,000	4,179,000	None	Sold at foreclosure to Public Service Transportation Co.
Second Avenue R.R., New York, N. Y.	23.96	1,862,000	5,682,000	3,140,000	Sold at foreclosure sale. Reorganization plan now pending before New York Transit Commission.
Total of foreclosure sales without discharge of receivers (5 cos.)	194.94	$5,790,300	$17,691,000	$3,140,000	
Foreclosures Without Receiverships in 1927					
Auburn & Syracuse Electric R.R., Auburn, N. Y.	29.04	1,962,000	1,742,000	.....	.....
Port Arthur Traction Co., Port Arthur, Texas	7.00	333,000	323,000	.....	.....
Batavia Traction Co., Batavia, N. Y.	2.50	10,000	14,100	.....	Operations abandoned.
Willamette Valley Southern R.R., Oregon City, Ore.	35.97	.....	666,000	.....	.....
Total forclosures without receiverships (4 cos.)	74.51	$2,305,000	$2,745,100		

(a) Included with Rockf ord & Interurban Ry. figures.
(b) Information not available.

Electric Railroad, Kansas City, Mo., following a receivership of eight years. The property was sold at foreclosure sale in August for junk. Residents along the route were so anxious to have operation resumed that the purchaser agreed to defer dismantling the tracks until they had an opportunity to make arrangements for operating the line. Negotiations are still under way to accomplish this, and it is hoped that operation will be resumed early this year.

The Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan., was sold at foreclosure and reorganized as the Kansas City, Kaw Valley Railroad. Interest charges have been reduced from $82,470 to $30,000 a year through the reorganization.

Foreclosure of the Second Avenue Railroad, New York City, occurred early in 1927 and the reorganization plan is now before the New York Transit Commission for approval, the receivership being expected to end early in 1928.

Three railways included in Table I, New Receiverships, are also shown in Table V, Terminations. These are the Cincinnati, Georgetown & Portsmouth Railroad, Cincinnati, Ohio; the Grandview Railway, St. Louis, Mo., and the Murphysboro & Southern Illinois Electric Railroad, Murphysboro, Ill. Of these, the two latter companies terminated their receiverships after foreclosure sale and dismantling of the properties. Termination of the receivership of the Cincinnati, Georgetown & Portsmouth Railroad was effected through reorganization after a receivership of less than six months.

Three other properties were sold and dismantled, the Denver & Interurban Railroad, Denver, Col.; the Mesaba Railway, Virginia, Minn., and the Sharon & New Castle Street Railway, Youngstown, Ohio. In the case of the Denver & Interurban Railroad, bus service was substituted under the name of the Denver & Interurban Motor Company. Although the Portsmouth, Dover & York Street Railway, Portsmouth, N. H., was sold and dismantled in 1926, the receiver was not discharged until 1927.

The property of the Washington-Virginia Railway, Washington, D. C., was sold at foreclosure and purchased by two companies organized to take it over, the Mount Vernon, Alexandria & Washington Railway and the Arlington & Fairfax Railway. These companies are operating the property under one management and dismissal of the receiver is looked for early this year.

The Westchester Street Railroad was sold to the Third Avenue Railway in 1926 and is now being operated by that company. To all practical purposes the receivership is over, but the actual dismissal of the receiver has not taken place, so the figures are still carried in Table IV.

Control of the Hannibal Railway & Electric Company, Hannibal, Mo., was purchased last winter by owners of the Hannibal Transportation Company, operating bus lines in and out of Hannibal. A voluntary petition in bankruptcy was filed in October, 1927, to dispose of the indebtedness taken over and a receiver was appointed.

The Morris County Traction Company, Morristown, N. J., was purchased at foreclosure sale by the Public Service Transportation Company, bus subsidiary of the Public Service Railway, Newark, N. J.

At the close of 1927 only three large companies remained in receivership, the Chicago Railways, with 597 miles of track; the Union Traction Company of Indiana, 445 miles, and the Detroit United Railways, 614 miles.

Manufacturers Reflect Confidence for 1928

Continuation of good times seen in opinions of industrial leaders and reports of 100 industrial business and engineering editors. Manufacturers close to electric railway industry look on new year with confidence

SOUND business conditions for the country in 1928 are reflected in the opinions of leaders of industry in the retail, utilities, manufacturing and other fields. These coincide with the forecasts of some of the leaders in finance, civic and trade organizations. In pre-visioning stability for 1928 some among them have based their beliefs on the present abundance of credit at low rates, volume of farm purchasing power resulting from improved agricultural conditions during 1927, low inventories and other controlling factors.

While in the offing looms up the shadow of a presidential campaign and the possibility that the coming campaign may tend to have an upsetting influence on business conditions, yet this does not appear to be viewed with any decided apprehension. The feeling evidently is one of confidence in the stability of the country's general economic position.

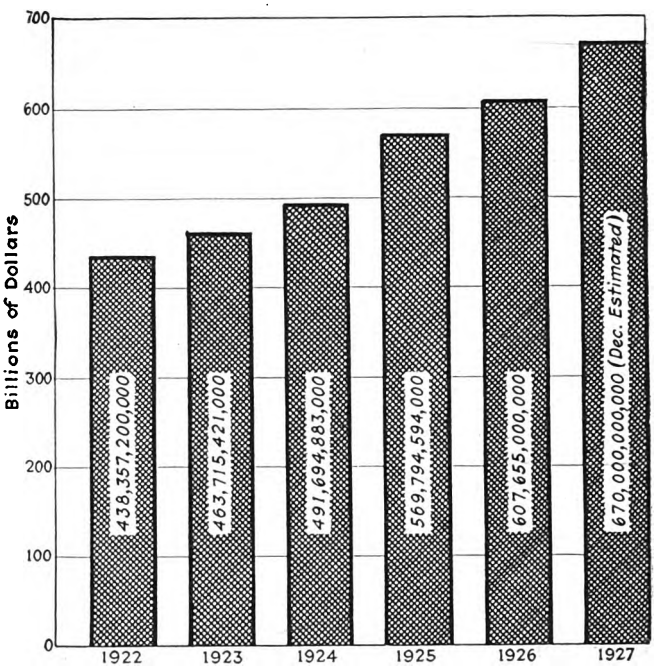
In connection with the views just quoted on credit and the presidential election, it is interesting to note what James S. Alexander, chairman of the board of directors National Bank of Commerce in New York, said at the annual meeting of shareholders on Jan. 10:

> While easy money alone is not sufficient to assure prosperity, it is a great help toward it, and it was unquestionably an important factor in business throughout 1927. The maintenance of the comparatively low rates which prevailed has been assisted by the open-market operations of the Federal Reserve Bank and the very moderate demands of commercial and industrial borrowers for funds. Present indications seem to point, not to cheaper money, but to fairly stable moderate rates, a condition highly favorable to good, sound business.
>
> * * * * *
>
> The record for many years back discloses no definite connection between presidential elections and the course of business. Some presidential years have been prosperous; some, periods of depressions, and some mixed. While the approach of the election will probably be reflected in a little more caution than might otherwise be in evidence, there is not much likelihood of the development of any seriously disturbing issue and we can foresee no justification for business nervousness because of politics.

Further indication of a continuation of prosperity in 1928 is found in a composite summary of year-end reports made to the National Conference of Business Paper Editors and the Associated Business Papers, Inc., by 100 editors of industrial, business and engineering publications.

Business Editors Review Prospects

Business in the United States reaches the close of 1927 in a sound condition and faces 1928 with every prospect of continued prosperity and of definite gains in certain basic industries, according to the above summary. The forecast also indicates that the buying power of the American farmer will increase during the present year and forsees continuance of wages at their present levels in the basic industries.

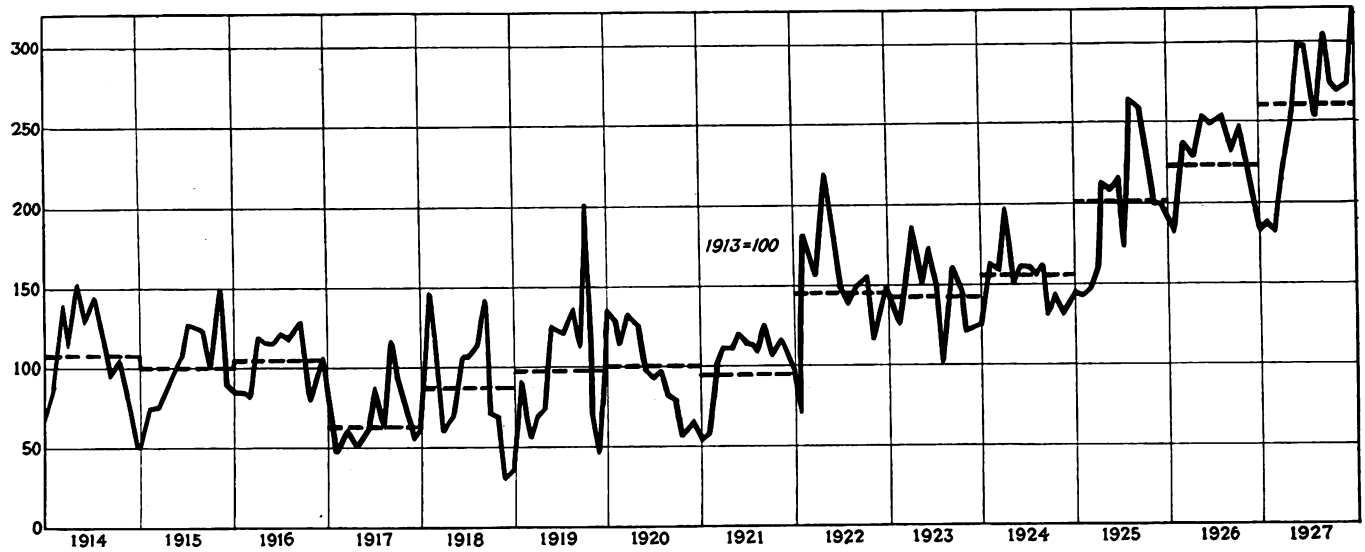


Bank debits to individual accounts, as reported by Federal Reserve Bank, reflect stability and prosperity of country

Outstanding in the policies of industry which will continue through 1928 are scientific determination of markets in line with intensive effort to reduce selling costs, and further widespread replacement of obsolete and inefficient machinery. The editors report at the year's closing a lack of excessive inventories, except in a few specialties where markets have been overestimated. Price trends indicate that levels will be about the same as they were in 1927, with some trades just now showing a softening in prices. Reduction in size and intensive development of jobbing areas is seen. No indications of slump are found on the nation's business horizon.

In reviewing 1927, the summary shows that indexes of trade which measure week-to-week activities, such as electric power used, output of pig iron and steel ingots, building construction and freight loadings, are slightly under those of 1926. Power used in 1927 increased 7 per cent over the previous year. Pig iron totaled 36,300,000 tons, putting 1927 in eighth place among big years. Steel ingot output was about 8 per cent less for 1927 than in 1926, making 1927 fifth among years of largest output.

Digitized by Google



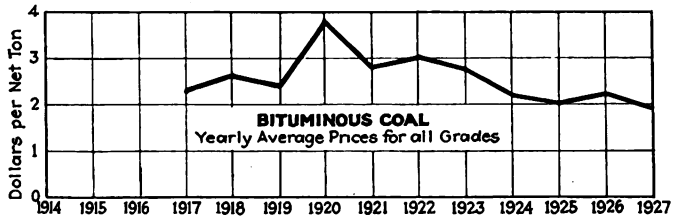
General construction volume index figure rises to highest point in fourteen years

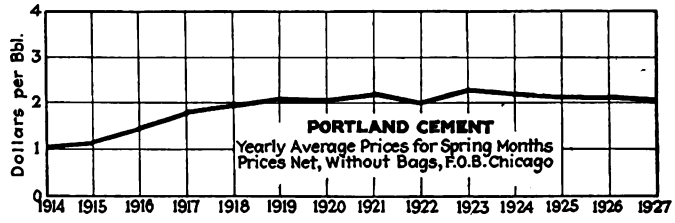
Volume of railroad freight declined, especially in the latter part of 1927, but in common with other trades there is expectation of an increase in freight in 1928. The volume of water-borne freight was slightly greater in 1927 than in 1926, and tonnage rates held steady.

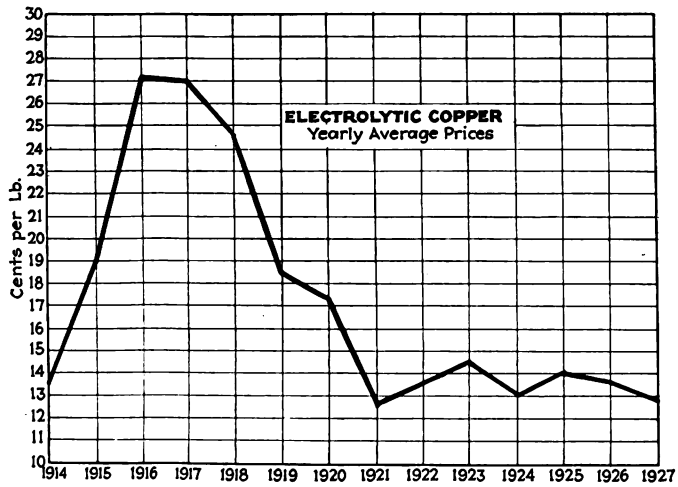
Building construction is reported lower, due to reduction of residential building, with industrial construction and certain classes of public works building very much increased. Heavy engineering construction is 11 per cent higher, industrial construction is 2½ per cent higher, electric light and power plant construction about 5 per cent over 1926, with an estimated additional 5 per cent increase in 1928.

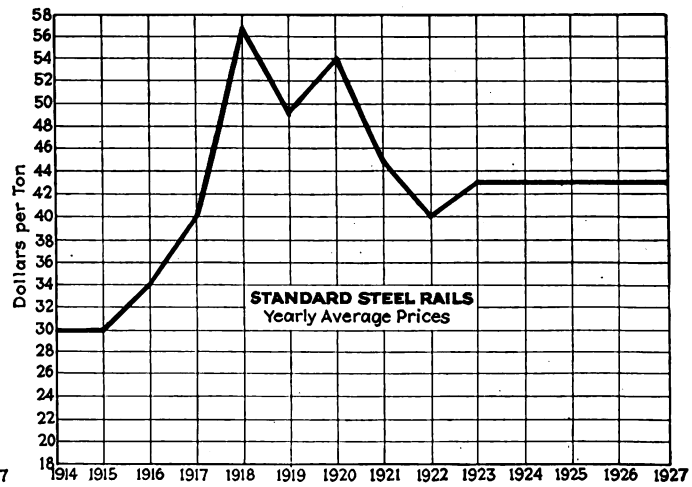
High specialization in machinery to reduce production costs marked several basic industries. In the cotton and rayon division of the textile industries, plants have been brought up to very high efficiency. Steel averaged 75 per cent of capacity in 1927 against 83 per cent in 1926, and pig iron capacity 73 per cent in 1927 against 80 per cent in 1926. In metal working lines the average of working operations was about 15 per cent less than in 1926. Nineteen hundred twenty-eight is expected to equal 1927. Railway equipment was used to greater efficiency in 1927. In the furniture trades there was about 90 per cent use of equipment.

The total payrolls in practically all industries were less in 1927 than in 1926. The notable exception was in the field of transportation. Railroad payrolls advanced about $60,000,000. Prices throughout 1927 are reported as slightly lower and the margin of profit less, but the outlook for 1928 is generally considered favorable, with some slight price increases. Pig iron prices during 1927 averaged 10 per cent less than in 1926 and steel prices were 4 or 5 per cent less. The profits of steel companies for the first nine months were from 15 to 20 per cent less than for the similar period in 1926.









Downward trend in price levels of three out of four basic industries. Others remain constant

Digitized by Google

In general, the close of 1927 finds the industries of the United States with stocks which deviate little from the volume at the close of 1926, reflecting continued hand-to-mouth buying. In the oil field the total stocks of crude and refined products increased about 12 per cent during this year. In the paint industry they are generally considered low. Iron and steel stocks are considerably lower than they were a year ago and the unfilled orders of the steel companies are from 12 to 15 per cent below those of the close of 1926. Crude rubber stocks are ample to offset any upward price movement. Volume of coal trade was less in 1927 than in 1926 and stock of coal on hand is greater.

In the chart of four basic industries accompanying this article, the 1927 yearly average prices for bituminous coal (all grades), Portland cement and electrolytic copper moved down, and that for standard steel rails remained the same as for 1926. This lack of any drastic change in prices indicates a reasonable steadiness of supply and demand and reflects a normalcy in basic manufacturing and transportation industries.

One of the elements which helps to make a composite gage to determine the stability of the country's business is the yearly total of bank debits to individual accounts, as reported by the Federal Reserve Bank. The accompanying chart shows this figure over a period of years. The figure for December, 1927, is not given by the Reserve Bank but has been estimated on the basis of December, 1926.

Light and Power Industry

In reviewing 1927 it is of interest to observe in the Jan. 7, 1928, issue of *Electrical World* that in 1927 the light and power industry used more than 37,000,000 tons of coal and that each year for several years the consumption of coal has increased at the rate of about 1,000,000 tons a year. Electrical manufacturers of heavy equipment did a gross business of about $1,000,000,000. In the same publication an article, "Light and Power Progress," by G. F. Wittig, statistical editor, furnishes the following information:

The year 1927 has witnessed a normal growth and development in the light and power industry. Its operations continue to expand, its service continues to supply an increasing demand and its management continues to develop better ways of doing business.

The 4,400 operating properties supply electricity to 21,700,000 customers in the United States. For this service they receive a gross revenue of $1,783,000,000. Operating and maintenance expenses used $767,000,000 of the revenue, taxes to local, state and national governments accounted for a sum estimated to be $150,000,000, and the balance of the revenue took care of incidentals, development expense, depreciation and obsolescence, and the credit requirements of an industry group whose operating and holding company capitalization aggregates $9,500,000,000. In 1927 the light and power utilities raised more than $2,100,000,000 in the money markets which they used for refunding high-rate issues and for additions to service facilities. Of this sum, $240,000,000 was raised by direct sales of securities to customers and employees in 344,000 individual sales. The capital expenditures for these properties aggregated $760,000,000 in 1927, and the budget for 1928 amounts to $900,000,000.

In their normal operations the light and power companies generated 75,100,000,000 kw.-hr., of which 29,000,000,000 kw.-hr. came from waterpower plants and 46,100,000,000 kw.-hr. from fuel-burning stations. The generating capacity of the industry aggregates 29,000,000 kva.; of the prime movers water power operates 11,700,000 hp. This power supplied nearly 16,000,000 of the 35,800,000 hp. driving our factories, to quote 1925 census figures, and it gave to the cities and homes the services and conveniences which only electricity can render.

Electric Railway Manufacturers Take Confident View

In order to obtain an idea of the prospects of the electric railway industry in 1928, as determined by its purchases, the Journal has queried executives of representative manufacturing companies in close contact with its needs and developments. The outlook is pretty generally viewed with optimism and confidence, as will be noted in the following opinions:

General Electric Company

DURING 1927, the electrical manufacturing business in general has been satisfactory, with approximately the same volume as in 1926. We look for additional activity during 1928 as most of the utility companies have already completed their financing and the total budget of expenditures for 1928 exceeds materially that of 1927.

We feel that economic conditions are sound and that the transportation companies will show added activities which will require additional electrical equipment for buses, street cars and locomotives.

J. G. Barry,
Vice-President.

Westinghouse Electric & Manufacturing Company

RAILWAY equipment business for 1927 has not measured up to what was anticipated at the begining of the year. The equipment business booked has been less than for the year 1926, whereas at the beginning of 1927 it was anticipated that this business would exceed that of 1926.

The association program looking toward more extensive modernization of cars has not as yet accomplished the full results hoped for in the actual replacement of obsolete equipment. It has, however, inspired a great deal of development on the part of the manufacturer and a great deal of interest on the part of the industry in new designs and new types of drive, which are now available. Having devoted the year largely to an intensive study and trial of the many new developments, the industry should now be in a position to decide what is best and enter upon a real program of purchasing new equipment in 1928.

Electric railway business must keep pace with the growth, the development and the expansion of our cities. The year 1928 will, undoubtedly, see a considerable increase in the purchase of automobiles, which will cause even greater congestion in the business districts than at present. The result will be favorable to the electric railways in that the car riding will be increased. Increased riding must be stimulated by more up-to-date and attractive equipment and this will result also in reduced operating expenses.

The gas-electric bus has a place, distinctly its own, in street railway transportation and there will undoubtedly be a gradual increase in the number of these equipments placed in service by electric railway companies.

While the railway equipment business in 1928 will not show a phenomenal increase over the year just closed, it is believed that the study and development of the past year should result in an increase in business, as compared with 1927, of about 25 per cent.

A. J. Manson,
Manager Traction Apparatus.

The J. G. Brill Company

THE year 1927, just passed, was one of the poorest in the history of car building. While car builders during the year contributed more in the way of equipment development than during previous years, the comparatively few purchases must not be construed as indicating a lack of appreciation on the part of the operating companies of the importance of improvements made. In most cases the value of present equipment represents a large percentage of the entire valuation upon which fare rates are based. The economic advantages of modern types of equipment are, therefore, placed beyond the reach of many electric railway companies due to inability to disturb the present arrangement.

Careful analysis of the situation on various properties reveals in many cases particular conditions involving franchises, paving regulations, etc., beyond

Digitized by Google

the control of the railway, which hinder the modernization program.

Equipment design has progressed. The improvements are here, and the industry through the agency of the trade press is familiar with what has been accomplished. Whether 1928 will witness any change in the situation depends principally upon electric railways obtaining relief from the particular conditions which have hindered the introduction of modern cars.

SAMUEL M. CURWEN,
President.

The Cincinnati Car Company

THE surest way to forecast trade conditions is to take a retrospective view of the growth of this great country. We find it has prospered from the beginning, and its growth has been linked at every stage with developments in transportation.

Electric railways have contributed their share to this prosperity; and while the motor bus and private automobile are supplying a part of today's increased demand for transportation, established railway lines are still the safest and cheapest means of urban travel, and will continue to dominate the field. The year 1928 promises increasing activities on the part of operating and manufacturing companies to meet the demand for more comfortable and faster moving cars.

H. L. SANDERS,
President.

Haskelite Manufacturing Corporation

OUR business in 1927 was slightly less than in 1926, but not to the same extent that the purchase of new cars decreased. This year we look for a greatly increased business as a result of our development efforts during the past few years. The riding public is demanding strong lightweight cars of greatly improved appearance. The satisfying of this demand means increased sales for us. The introduction of a 40-passenger single-deck bus will stimulate operators to improve their rolling stock. We are very optimistic for 1928.

JAMES R. FITZPATRICK,
Vice-President and Secretary.

Bridgeport Brass Company

OUR business with the transportation companies during 1927 was not equal to that of 1926. This, no doubt, was due to conditions throughout the country which seemed quite general and resulted in less business in most industries.

We do feel that there are indications that 1928 will show a considerable improvement, and we are quite optimistic in regard to the outlook.

A. D. GUION,
Advertising Manager.

Ohio Brass Company

IT has become recognized in the electric railway industry that successful transportation is not only a matter of improving service but of improving the methods of selling that service and the orgnization back of it. In this connection there has been a trend toward better equipment, track and overhead. From this progression, in 1927, our company has experienced a good volume of business with O-B products for car, track and overhead. Likewise, it is anticipated that this continued interest and activity of railway men will result in an increased business in 1928.

E. F. WICKWIRE,
Vice-President.

A.C.F. Motors Company

IN OUR opinion, motor coach transportation made considerable progress in 1927 despite the fact that coach manufacturers generally sold fewer coaches than in previous years. There was, we believe, a more careful selection of the types of vehicles purchased and a marked improvement in the methods, application and operation of motor coaches by the electric railway companies generally.

We believe that more coaches will be sold in 1928 than in 1927, and we naturally believe that the tendency is toward the purchase of heavy-duty vehicles. There is a decided trend toward the purchase of the very best equipment possible, regardless of its price.

We look for the retirement of a considerable number of light-duty coaches bought during the years of 1923 and 1924 which are no longer able to furnish the type of transportation demanded by the American public. These will undoubtedly be replaced to a certain extent by heavy-duty vehicles, both of the standard urban coach and of the de luxe urban coach types. In order to increase the ratio of passenger-miles, we anticipate the establishment of many high-speed, high-fare motor coach lines in city and suburban service, designed to appeal to the habitual coach rider morning and evening and to the present-day automobilist during the off-peak hours.

We feel that all motor coach manufacturers have made considerable progress in design and construction during 1927 and that this will result in improved motor coach transportation as the newer types and models of motor coaches are put into service by the electric railways in 1928.

C. S. SALE,
President.

Twin Coach Company

OUR analysis of bus operation throughout the United States indicates that 1928 should be a banner year from bus sales standpoint for two reasons. First, the introduction of single-deck coaches of larger carrying capacity is and will continue to open up entirely new fields for the economic operation of motor coaches. Second, many of the larger transportation companies will have a rather large number of coaches that will be completely written off and replacement equipment will be purchased, whereas 1927 saw very little replacement equipment purchased.

F. R. FAGEOL,
President.

The White Company

BUSINESS prospects for 1928 in the motor truck and bus industry indicate a much better year than 1927 turned out to be. Most manufacturers have studied and analyzed general conditions as reflected in business reports from all parts of the country, have sized up the readings of the so-called "barometers" of business and agreed in the prediction that the new year will be one of greater volume and prosperity—possibly the biggest year in the history of the automotive industry.

The year now closing has been one not only of severe competition, small margins of profit and dull business in certain localities, but a year of readjustment. New tendencies in highway transportation have dictated new developments in motor vehicles for hauling of both passengers and freight, as well as revamping of manufacturers' lines to a certain extent. Most of this work has been accomplished, and we look forward eagerly to 1928 as a year of renewed activity in selling.

So far as The White Company is concerned, we are ready to meet the conditions of the new year. This growing tendency toward lighter and more flexible units has necessitated production changes. New White models of light delivery and fast express trucks, introduced during 1927, are in full production now. This is true also of the new White six-cylinder, 100-hp. bus. The latter part of the year has witnessed the cleaning up of repossessions and other unavoidable obstacles. The new year finds our company with a balance sheet showing an exceptionally strong financial position, with a complete line to meet the new demands of motor transportation in all its commercial phases, and with every confidence that 1928 is to be a good year.

WALTER C. WHITE,
President.

Metal & Thermit Corporation

WE ARE very optimistic for the electric railway business for 1928. During 1927 our business with street railways increased more than 40 per cent over 1926, and we are looking forward to a similar increase in 1928.

While there is still some doubt by the railway operators in the future of the industry, which we think is unwarranted, there is a general tendency toward optimism which has led most companies to seek out the best and most permanent methods of doing their

Digitized by Google

work. It is interesting to know that practically all the railways that have taken an optimistic view of the future and have made concerted efforts to give the public what it wants in the way of modern transportation, are making their operation a success.

It is to be hoped that 1928 will see a larger percentage of the railways in this class.

JOHN T. TINNON,
Manager Rail Welding Department.

Consolidated Car-Heating Company

EQUIPMENT orders from transportation companies were somewhat disappointing during a part of 1927. Toward the end of the year conditions materially improved, and we look with confidence into the year 1928.

CORNELL S. HAWLEY,
President and Treasurer.

National Pneumatic Company

IN 1927, it seems to us, transportation has come much closer to its goal, not only keeping pace but catching up with the demands of constantly increasing traffic. Facilities have been extended. Equipment has been added to or adapted to meet new demands with greater efficiency and at a lower operating cost.

Co-ordination has brought various branches of service into closer relationship and affiliation. This results in broader and better service to the public. We look for a continuation of, and even an acceleration of, this tendency in 1928, with increased patronage and reduced expense for all modern and progressive transportation agencies.

T. W. CASEY,
Vice-President.

SKF Industries

THE year 1927 was from our observations one in which the transportation companies showed a disposition to give serious thought to matters of maintenance and the general improvement of the efficiency of their service.

While the volume of business done by us with them was not large, it was satisfactory in character. From present appearances it is our judgment that the year 1928 should show a substantial improvement in volume over that of last year.

S. B. TAYLOR,
General Sales Manager.

The Tool Steel Gear & Pinion Company

OUR railway gear sales in 1927 were about 5 per cent better than in 1926. Our export gear business showed a similar improvement. Approximately one-sixth of our total sales was in new equipment, i.e., where our gears were specified on new motors for new cars. This class of business showed a decided improvement over 1926 and has been increasing from year to year for the last few years.

We look for a much greater improvement, especially in the new equipment field, during 1928. It has been evident of late that the electric railway industry is coming back and that the method is to be snappy service with modern equipment. We feel the next few years will show a decided improvement in purchases for rehabilitation, and that the industry will buy the best equipment it can get. It will look to ultimate operating economies and good will on the part of its patrons to bring electric railways back to the place they deserve.

E. S. SAWTELLE,
Assistant General Manager.

Portland Cement Association

THE street car companies are emerging from the period of adjustment made necessary by conditions brought about by bus and automobile transportation. They are meeting this competition with better service, better equipment and better track.

The engineering departments of the street railway companies are giving more attention than formerly to the development of standard designs of car track construction and particularly to that portion of the track structure that must transfer the loads to the soil.

While exact data are not available, it appears that the use of a definite rigid foundation to support car tracks is gaining favor and that more of the so-called "rigid" type was constructed in 1927 than in any previous year.

The outlook for car track reconstruction rehabilitation in 1928 is promising. The extent of it will, of course, depend in a large measure on the money available for such work.

A. C. IRWIN,
Manager Railways Bureau.

Ohmer Fare Register Company

THE business of the Ohmer Fare Register Company in the past twelve months showed a marked degree of progress and expansion, and in fact 1927 was the best year in our history.

The progressive transportation manager is less inclined than ever before to depend on guesswork in the operation of his system, but requires a method that will insure an accurate and dependable record of the income derived from each day's operation. The Ohmer system of fare registration was therefore in great demand in 1927.

With the realization of transportation managers generally of the importance of protecting income at its source and furnishing statistical data concerning the operation which is of vital importance, the demand for our products increases proportionately, and our opportunities for 1928 give great promise of a record year.

JOHN F. OHMER,
President.

Heywood-Wakefield Company

I CONSIDER the outlook for the sale of seats to transportation companies during 1928 to be excellent, especially in the line of bus seats. During 1927 we had a banner year in our car seat department. We are looking forward to even better business during 1928.

BERTRAM BERRY,
Manager of Sales, Car Seat Department.

Westinghouse Air Brake Company

WE ARE entering the year 1928 with a decided feeling of optimism for business in general and particularly so for the transportation and allied industries.

General conditions throughout this country are fundamentally sound and most lines of business are now striking the stride that indicates an active and prosperous year.

As relates to the transportation industry, it is obvious that the high degree of efficiency with which it is being operated (both steam and electric) has brought about a return of confidence as indicated by the large purchases of rolling stock during the past 60 days.

The substantial improvements that have been made and are continuing in the electric railway industry, contributing to the comfort and convenience of the public, has brought about an appreciation on the part of the public that their interests are best served by upholding and supporting the service and, with the extension of the improvements and with proper co-ordination of electric car and bus service, the industry as a whole should enjoy a very prosperous year.

S. G. DOWN,
Vice-President.

Globe Ticket Company

DESPITE a temporary wave of false economy, which brought price into undue prominence in some quarters during 1927, the year was one of great advancement for us in the transportation field.

Progressive properties are showing a quickened interest in fare control methods which are safe, efficient and genuinely economical from every standpoint. Among other favorable indications, two of the largest transfer users in the United States invited our suggestions, abandoned their old concepts and placed their business with us.

Electric railway properties in 1927 definitely started on the return swing of their prosperity pendulum.

P. C. SNOW,
Vice-President.

Association Activities

Program Complete for C.E.R.A. Meeting

THE final program for the Central Electric Railway Association meeting at Cincinnati, Ohio, has been completed. Following is the schedule of events:

THURSDAY, JAN. 26, 1928

9:30 A.M.—Address of Welcome, Hon. Murrray Seasongood, Mayor of Cincinnati, Ohio.

Address of the President, M. Ackerman, manager Peoples Railway, Dayton, Ohio.

"Relationship of Freight Traffic to Revenue," by F. D. Norviel, general passenger and freight agent Union Traction Company of Indiana.

"The Situation in Cincinnati," by W. A. Draper, president Cincinnati Street Railway.

12:30 P.M.—Adjournment for lunch.

2:00 P.M.—Motor coach tour of the city of Cincinnati and inspection of the shops of the Cincinnati Street Railway.

6:30 P.M.—Association dinner.

Address, Judge Roland W. Baggott, Dayton, Ohio.

Dance.

FRIDAY, JAN. 27, 1928

9:30 A.M.—"The Cincinnati Plan," by Edgar Dow Gilman, Director of Public Utilities city of Cincinnati.

"Publicity," by J. E. Morton, secretary Ohio Bankers Association, Columbus, Ohio.

"Advertising Transportation. How Much of It Is Science? How Much of It Is Bunk?" by E. T. Gundlach, Gundlach Advertising Company, Chicago, Ill.

General business.

Election of officers.

International Street Railway Convention at Rome

PUBLICATION of the preliminary program for the Rome meeting of the Union Internationale de Tramways, de Chemins de fer d'Intérêt local et de Transports Publics Automobiles, has just been made by the secretary of the association from association headquarters in Brussels, Belgium. It is as follows:

Sunday, May 6—Registration, issue of final program, meeting of the executive committee.

Monday, May 7, 9:30 a.m.—Reception and opening session to be held in the Campidoglio building (Capitol); afternoon, technical session; theater party in the evening.

Tuesday, May 8, 9 a.m.—Technical session; 2 p.m., a sightseeing tour; 5 p.m., visit to the Campidoglio; 8:30 p.m., banquet offered by the Municipal Tramways of Rome.

Wednesday, May 9, 9 a.m.—Technical session; 1 to 2 p.m., departure by special train for Naples; 5:30 p.m., arrival at Naples and sightseeing trip; 9:30 p.m., reception by the municipal authorities of Naples at the Palais Royal.

Thursday, May 10, 9 a.m.—Trip to Pompeii and return to Rome by special train in the evening.

Friday, May 11, 9 a.m.—Technical session; 2:30 p.m., excursion to the environs of Rome.

Saturday, May 12, 9 a.m.—Technical session; 3 p.m., inspection visit to the offices and carhouses of the Rome Tramways; 8 p.m., complimentary banquet offered by the National Facisist Transportation Association of Italy.

Sunday, May 13, 9 a.m.—Technical session, business meeting and adjournment; 2:30 p.m., sightseeing tour; 8:30 p.m., departure for Turin.

Monday, May 14, 9 a.m.—Arrival at Turin; 11 a.m., reception at Porta Nuova for a visit to the exposition and luncheon offered by the Municipal Tramways of Turin; afternoon, visit to the exposition and the city; evening, theater party.

Tuesday, May 16—Visit to the offices and shops of the Fiat Automobile Company; excursion to the environs of Turin, and luncheon offered by the Società Ferro-Tramviarie; evening, departure for Milan.

Wednesday, May 16—Visit to the Milan Exposition in the morning; trip around the city in the afternoon; and dinner offered by the Milan municipal authorities in the evening.

Thursday, May 17—Excursion to the Italian Lakes.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Jan. 16-17*—Midwest Electric Railway Association, Arlington Hotel, Hot Springs, Ark.**

***Jan. 18-19*—Kentucky Association of Public Utilities, annual meeting Brown Hotel, Louisville, Ky.**

***Jan. 18-19*—Central Electric Traffic Association, Hotel Gibson, Cincinnati, Ohio.**

***Jan. 25*—Central Electric Railway Master Mechanics' Association, Hotel Gibson, Cincinnati, Ohio.**

***Jan. 25-26*—American Railway Association, Motor Transport Division, organization meeting, Palmer House, Chicago, Ill.**

***Jan. 25-27*—Electric Railway Association of Equipment Men, Southern Properties, Roosevelt Hotel, New Orleans, La.**

***Jan. 26-27*—Central Electric Railway Association, Hotel Gibson, Cincinnati, Ohio.**

***Jan. 31*—New York Electric Railway Association, annual meeting, Hotel Commodore, New York, N. Y.**

***Feb. 13-17*—American Institute of Electrical Engineers, winter convention, New York, N. Y.**

***Feb. 17-18*—Central Electric Railway Accountants' Association, Hotel Gibson, Cincinnati, Ohio.**

***May 2-5*—Southwestern Public Service Association, Dallas, Texas.**

***May 6-12*—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, annual meeting, Rome, Italy.**

***June 6-8*—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.**

***July 8-12*—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.**

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention, Cleveland, Ohio.

Details Arranged for C.E.R. Master Mechanics Association

THE program for the meeting of the Central Electric Railway Master Mechanics Association is as follows:

WEDNESDAY, JAN. 25, 1928

9:30 A.M.—Address of the president, George R. Green, general superintendent Chicago, South Bend & Northern Indiana Railway.

"Variable Load Brake," by J. S. Y. Fralich, Westinghouse Traction Brake Company.

Discussion.

"W-N Drive and High-Speed Traction Motors," by W. J. Clardy, Westinghouse Electric & Manufacturing Company.

Discussion.

"Slide Rule and Calipers" (luncheon talk), by E. H. Arnott, Central Service Bureau.

"Railway Roller Bearings," by M. S. Downes, Timken Roller Bearing Company.

Discussion.

Reports of committees.

Round-table—General discussion.

Election and installation of officers.

Adjournment.

8:30 P.M.—Meeting of executive committee of Central Electric Railway Association.

Toronto Selected for Canadian Meeting

TORONTO has been selected as the location for the 1928 convention of the Canadian Electric Railway Association. The dates are June 6, 7 and 8. As in previous years there will be an exhibit of electric railway supplies.

Southern and Southwestern Equipment Men to Meet Jointly

INVITATIONS have been sent out for the thirteenth semi-annual meeting of the Electric Railway Association of Equipment Men, Southern Properties, to be held in New Orleans, La., at the Roosevelt Hotel, Jan. 25-27. This will be a joint meeting with the mechanical division of the Southwestern Public Service Association.

Digitized by Google

News of the Industry

Ten-Cent Cash Fare Suggested in Dallas

Officers of the Dallas Railway & Terminal Company, Dallas, Tex., filed with the Mayor and Board of Commissioners of the city on Jan. 9 an application for an increased fare, in which they set forth fully the conditions which make such fare necessary.

Feeling that the patrons of the company, and the citizens of Dallas generally, are directly interested, the application was made available to the public in full.

The proposed schedule of fares recognizes the fairness and justice of charging a ticket rate substantially less than the cash fare rate, thereby providing service to the regular and habitual rider at a rate less than that charged to the transient or casual rider. A statement by the company says:

> The company is desirous that the citizens of Dallas, and particularly its patrons, acquaint themselves with the conditions which made this application necessary, and accordingly it extends to every citizen an invitation to request such additional information on the subject as may be desired, as it feels that a lack of mutual understanding will be responsible for whatever difference of opinion may exist.

In its plea the company "respectfully requests that your honorable body establish such new schedules of rates as will accrue in the reserves of the company amounts sufficient to enable it to make the necessary repairs as they accrue; to replace its property when and as it becomes exhausted, inadequate or obsolete; and at the same time to maintain said reserves at normal, as contemplated by its franchise."

The rates suggested tentatively are a 10-cent cash fare for adults, with five tickets for 35 cents; students' tickets at 4 cents and children five to twelve years old at 4 cents.

Third Arbitrator Wanted in Chicago

Following a series of wage conferences between Guy A. Richardson, vice-president, representing the Chicago Surface Lines, Chicago, Ill., and Alderman Oscar Nelson, representing the trainmen's union, announcement was made on Jan. 10 that the two men were unable to agree and would immediately begin considering the selection of a third man.

Under the terms of the arbitration agreement signed Messrs. Richardson and Nelson were to proceed to consider the terms of an arbitration of the demands of the union for a wage increase of 15 cents and for life and sick benefit insurance, as well as the suggestion of the company for a decrease of 5 cents in the present wage scale. Upon agreement they would have been authorized to extend the agreement to June 1, 1930.

In the case of disagreement, however, they were to proceed at once to select a third man to complete the board of arbitration, and in this event any agreement reached would cover only the present fiscal period ending June 1, next.

Experimental Rates in Santa Barbara

Following a study of the Santa Barbara & Suburban Railway increased rate case the California Railroad Commission found on Jan. 3 that the situation calls for a trial of experimental rates to determine whether or not any fare structure could be devised which will make it possible to continue the service. The company was directed to file within five days the following schedule of fares for its rail and bus system: Single cash fare to the holder of an identification card, 5 cents; individual weekly identification card, 25 cents; individual identification card for a longer period than one week, at the fare of 25 cents a week or such lesser fare as the company may fix; single cash fare, 10 cents.

In ordering the experimental rates which will provide a 5-cent fare to the holder of a weekly identification card costing 25 cents, the commission said that the consensus of opinion was in favor of first trying a 10-cent fare with a 25-cent weekly identification card or pass entitling the holder to a 5-cent fare.

According to the commission, the argument in favor of this form is that the regular rider, depending upon the number of times he rides, may enjoy a fare approximating the one now in effect. This plan has the added advantage of doing away with the multi-coin fare which slowed up traffic and irritated the rider.

Chaos Again in Columbia

Approximately 60,000 people are without dependable transportation system. City Council favors return of street car. Jitneys running sans schedule and sans route

AN EMERGENCY state in the transportation muddle in Columbia, capital of South Carolina, was reached recently when the buses of the Carolina Transit Company, 21 all told, were sent to Charlotte, N. C., where they were put in storage, leaving the Columbia field to the unregulated jitneys. A year ago Columbia offered a choice of three modes of transportation to its citizens—one could ride on street cars, buses or jitneys—the fares amounting to about 10 cents in each instance. Now only one system remains, that of the jitneys, which have no definite schedule, operate over no definite route and are withdrawn from the streets at the pleasure and whim of the owners. These vehicles are owned by individuals.

The many incidents in Columbia's transportation muddle, becoming more complex since last March, when the Columbia Railway, Gas & Electric Company stopped the operations of its street cars on the ground of lack of patronage, have been reviewed from time to time in these pages. Early, in December, 1927, the Carolina Transit Company and a bus manufacturing company made a proposition to the Columbia City Council to operate the street cars in conjunction with the buses. The Council, feeling that the Broad River Power Company, which has the franchises for furnishing light, power and gas to the city, should also operate the street cars, looked with disapproval on the proposition.

Late in December a representative of the bus manufacturing company went to Columbia, sales of "token" used in lieu of fares were stopped, employees were released and on the last night of the year of 1927, a few minutes after midnight, the buses, in a long caravan, left the city for Charlotte. Columbians awoke on the dawn of the New Year with no system of public transportation other than that furnished by the jitneys. The proposition made to the Council for the operation of buses in conjunction with street cars was withdrawn.

Last summer the Council passed an ordinance regulating the jitneys, prescribing routes and schedules for them. The jitney union at once instituted legal proceedings to have the ordinance declared unconstitutional, and the case was taken to the State Supreme Court, where it now rests.

The City Council has taken the position that street cars offer the best and most satisfactory system of transportation and it is now considering passing another ordinance having to do with transportation, an ordinance separate and independent from that now before the Supreme Court. Its intention is to force the Broad River Power Company to run the street cars.

Decision in Labor Injunction

New York court returns case with suggestion of possible modification of sweeping terms

THE New York Court of Appeals on Jan. 10 suggested possible modification of the injunction issued by the New York Special Term in the case of the Interborough Rapid Transit Company, New York City, against Edward P. Lavin, Harry Bark, Joseph G. Phelan and James F. Walsh, restraining them from interfering with the employees of the Interborough and inducing them to join an association of railway employees secretly. The court held that an injunction for some part of the relief prayed for is justified by the record and sent the case back to the Special Term "in order that it may exercise its discretion as to whether an injunction of more limited scope should be issued."

EXTRACTS FROM COURT OPINION

After discussing the contractual relations of employee and employer Judge Lehman wrote:

Where employees have freedom of choice a labor union may not be accused of malicious interference when it urges the employees to make that choice in its favor; even though the choice may involve termination of present employment and consequent disruption of a business organization.

The defendants have the right to induce the plaintiff's employees to join the Amalgamated Association, though that may involve termination of their employment. They are under no obligation to the plaintiff to inform it that some of the plaintiff's employees are joining the union, so that the plaintiff may exercise its choice of retaining or discharging the new members.

Though we have decided that the defendants may not be enjoined from inducement by lawful means to leave the service of the plaintiff or to join an organization of employees other than the brotherhood or to make demands upon the plaintiff for increased wages, yet even such purposes may not be effected by unlawful means.

The defendants may not without the permission of the plaintiff enter upon plaintiff's property or place any signs thereon for the purpose of inducing even lawful action on the part of the employees. The defendants may not achieve their purpose by malicious falsehood and deceit. They may not use force or intimidation.

Though the court at Special Term would have been justified in issuing an injunction against any threatened use of unlawful means, even to achieve lawful end, and though we leave open the question of whether the defendants may be enjoined from inducing the plaintiff's employees to conceal from the plaintiff that they had joined the Amalgamated Association, the injunction, as issued, was beyond the power of the court.

Under these circumstances the orders should be reversed and the motion remitted to the Special Term in order that it may exercise its discretion as to whether an injunction of more limited scope should be issued upon the facts contained in this record.

After the strike of Interborough employees in 1916 a voluntary unincorporated association was formed under the name of the Brotherhood of Interborough Rapid Transit Company Employees. Substantially all 14,000 employees of the company joined the brotherhood. In 1926 the defendants were members of the General Committee of the brotherhood. On July 1, 1926, a group of the employees by a vote of 579 to 7 rejected a proposal that the wages and working conditions should remain unchanged.

The following day the men, through Lavin, demanded an increase in pay. On July 6 a strike started, lasting until July 30. The four individuals named by the company were leaders in the strike movement. It was charged they sought to have the men join the Amalgamated Association.

The Interborough then brought this action to secure an injunction which would in effect prohibit the defendants Lavin and others from inducing Interborough employees by lawful or unlawful means to leave the company's employ. An injunction in its broadest terms was granted.

Nathan D. Perlman of counsel for the Amalgamated Association said on Jan. 10 that the decision of the Court of Appeals was in the first injunction action brought by the Interborough Rapid Transit Company to prevent unionization of its employees, but added that he believed it would have an effect on the decision in the company's second injunction action, which will be argued before Supreme Court Justice Isidore Wasservogel on Jan. 23.

Ford Studies Transportation of Its Men

Following studies conducted at the River Rouge plant of the Ford Motor Company to determine the best method of providing for the transportation of 45,000 men moving in and out of the plant three times a day it has been decided that the best method will be to provide loading and unloading facilities on the company's property so that cars and buses can handle employees. The problem involves a movement of this large number of employees within a period of approximately a half hour.

Parking in Chicago Restricted

The elimination of parking in the Loop district of Chicago, Ill., became effective Jan. 10. Parking is forbidden on weekdays between 7 a.m. and 6:30 p.m. in the entire congested area of the central business district. During these hours passenger motor cars are permitted to stop at curbs only long enough to discharge and receive passengers. Taxicabs are permitted to park only at authorized cab stands, and only the authorized number of cabs are permitted in these stands. Delivery trucks are permitted to use the curb space for not more than one-half hour for loading and unloading purposes. A fine of $1 to $25 for each offense is provided by the ordinance. The ordinance is not in effect on Sundays and holidays, and on Saturdays parking is permitted after 3 p.m.

Bus Operators an Issue in Pennsylvania Strike

Insistence of trainmen to have the word "subsidiary" inserted in a wage agreement resulted in a strike on Jan. 6 on the lines of the East Penn Railway between Tamaqua and Mauch Chunk, Pa. The word "subsidiary" would cover buses, which are to be used as feeders for the railway lines and under it the bus drivers would be required to become members of the union.

Weekly Pass Replaces Permit Card at Halifax

The Board of Commissioners of Public Utilities for Nova Scotia has approved the application of the Nova Scotia Tramways & Power Company, Ltd., to change from a 5-cent permit card to an unlimited ride, transferable weekly pass. The permit card was adopted by the former management on June 1, 1924, on the occasion of going from 7 cents cash and seventeen tickets for $1 to 10 cents cash and six tickets for 50 cents. Permits were sold at the rate of $1 a month for all hours and 50 cents a month for specified off-peak hours. The permits were also sold at diminishing rates throughout the month, so that an all-hour permit cost only 60 cents after the fourteenth day of the month, while an off-peak permit was then obtainable for 30 cents.

From March, 1925, the company sold the 8⅓-cent tickets at three for 25 cents and during 1926 it added a thirteen-rides-for-$1 ticket book. The new schedule calls for an unlimited-ride weekly pass for $1.25 and a ticket rate of fourteen for $1 in book form.

Zone Limits at Wilkes-Barre Approved

The Public Service Commission has refused in an order to force the Wilkes-Barre Railway, Wilkes-Barre, Pa., to revise its rate schedule on the branch between Wilkes-Barre and Sugar Notch Borough. The borough filed a complaint with the commission in Harrisburg alleging that the service maintained was inadequate and that the fare charged was unjust.

In its decision the commission dismissed the allegation on the inadequacy of service without much discussion. The section between Sugar Notch and Wilkes-Barre city is divided into two fare zones, with an average length of 2.98 miles each. Other zones on the line the commission found in its study to be approximately the same length.

The commission said it was obvious that zones on a railway system could not all be the same length. The zoning system on the Wilkes-Barre railway lines has been in effect for many years and the commission said it found nothing to indicate that the zones on the lines are unjustly discriminatory or an abuse of managerial discretion.

New Fares in Effect in Council Bluffs

All cars of the Omaha & Council Bluffs Street Railway, operating in Council Bluffs, Iowa, left the carhouse on Dec. 31 with prominent placards announcing a new 10-cent fare effective at once. The 10-cent fare decision was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 10. The new rates are as follows:

	Cash	Ticket
Council Bluffs, local—adult	10c	6 for 40c
Council Bluffs, local—child	5c	10 for 35c
Omaha-Council Bluffs	10c	10c
Omaha-Council Bluffs—commutation	..	30 for $2.25
Council Bluffs-Iowa School for the Deaf—adult	10c	Round trip 15c
Council Bluffs-Iowa School for the Deaf—child	..	Round trip 10c
Omaha-Iowa School for the Deaf—adult	..	Round trip 25c
Omaha-Iowa School for the Deaf—child	..	Round trip 15c

In the Jan. 1 issue of *Street Car Topics*, published by the Omaha & Council Bluffs Street Railway, an explanation is made by the company for the necessity for an increase in fare. It was the conclusion of the company that it was best to establish the same rates in Council Bluffs as are in effect in Omaha.

W. Winans Freeman Wins McGraw Award

Electrical men paid tribute to W. Winans Freeman Jan. 10 at a dinner given at the Hotel Roosevelt, New York, on the occasion of the presentation of the James H. McGraw Award medal for co-operation. Prominent executives numbering 300 from Eastern points and as far west as Chicago, gathered to express the approval of the industry of the outstanding service rendered by Mr. Freeman in accomplishing the reorganization of the Society for Electrical Development, by which its directorate has been made officially representative of the major national associations of the industry. It was in recognition of this that the medal was awarded.

P. G. Gossler, president of the Columbia Gas & Electric Company, paid a personal tribute to Mr. Freeman, and Owen D. Young, chairman of the General Electric Company, eulogized the practical ideal which is the basis of the McGraw Award, the recognition of the service of individuals in the advancement of the industry.

In responding, Mr. Freeman dwelt upon the promise of broadened opportunity now opened to the electrical industry through the closer unity that has been effected between the national associations. He modestly insisted that the credit for the accomplishment should go to his associates on the directorate of the society and to the staff.

Mr. Freeman was selected for the award by judges representing the four branches of the industry—J. E. Montague, S. L. Nicholson, G. E. Cullinan and James R. Strong.

Mr. Freeman is chairman of the Union Gas & Electric Company of Cincinnati, vice-president of the Columbia Gas & Electric Company, New York, and for eight years has been president of the Society for Electrical Development.

Seattle Will Not Borrow from Peter to Pay Paul

By a vote of five to one, a group of City Councilmen who attended a conference called by Mayor Bertha K. Landes of Seattle, Wash., disapproved of a plan to loan funds of the city Light Department to the Municipal Railway, to permit cashing about $121,000 in payroll warrants to be issued on Jan. 10. The Light Department has approximately $400,000 derived recently on a bond sale, lying in banks at 2 per cent, and the plan was to loan that to the Railway Department at the 5 per cent the payroll warrants will bear until paid. Councilmen took the stand that it would be "foolish to make one utility carry another."

The plan to effect a loan from the city light funds to aid the Municipal Railway in meeting a payment of more than $1,000,000 due next March on the purchase of the railway from its private owners developed controversy among members of the City Council.

A resolution adopted by the Clearing House Association last year declaring against all warrants is still standing, but individual members of the association have stated they will take the payroll warrants.

A group of representative Seattle business men and real estate operators appeared before the utilities committee of the City Council recently protested again the Council acting favorably on two propositions under consideration for providing aid for the municipal railway from the general fund. The committee had before it two bills, both of which were drawn up to place them on the ballot at the city election on March 13. The bills, prepared by Councilman E. L. Blaine and Oliver T. Erickson, are alike with the exception of a 5-cent fare proposal contained in Mr. Erickson's measure. Both measures provide a limit of 3 mills in the tax levy for railway aid. According to estimated valuations for next year, the levy would yield between $800,000 and $900,000 for the railway.

Mr. Erickson stated that his measure was offered as first aid, and not a solution, for the serious problem in which the railway finds itself. He said:

> Anything the citizens' committee would recommend could not be put in effect for two years. If the present situation continues, we might as well take the cars off.

At a meeting in the Rainier Valley District, business men of that section went on record as strongly opposing any attempt to return to 5-cent fare on the municipal railway, pointing out that it was impossible for the Seattle & Rainier Valley Railway to reduce its fares.

Plan Petition to Governor for Chicago Traction Session

Circulation of a petition asking Gov. Len Small to convene a second special session of the state Legislature for the purpose of granting the city of Chicago the necessary enabling legislation to clear up the long-pending local transportation problem is proposed in a call for a meeting of the City Council committee on local transportation on Jan. 16, recently issued by Chairman Joseph B. McDonough. If the plan is approved, Alderman McDonough declared, a canvass will be started at once to obtain 100,000 signatures among the civic, business and labor organizations of the city.

While the merits of this procedure were being discussed by city officials, rumors began to filter in from Springfield that the Governor, of his own accord, may still decide to summon another special legislative session to deal with the Chicago traction program. He failed to include traction in the business of the current special session which convened Jan. 10.

At the Jan. 16 meeting Alderman McDonough expects the five transit bills embodying the needed legislation to be presented in final form. Following a meeting with company representatives early last month, the bills were handed back to the city attorney and a sub-committee for certain minor changes.

Membership of Legislative Committees Announced in New York

John M. Hackett, Poughkeepsie, again heads the public service committee of the Assembly, in the appointments handed down by Speaker Joseph A. McGinnies of the Assembly on Jan. 9. To this committee is referred all bills relating to public utilities and amendments to the public service commission law. Other members of the committee include Catchpole of Ontario, Pammenter of Monroe, Grenthal of New York, Stephens of Putnam, Munsel of Clinton, a new man succeeding Winters of Schuyler, who did not return to the Assembly; Fisher of Lewis, Dickey of Erie and Condon of Westchester, a new member succeeding Emerson of Jefferson, who did not return, Republicans, and Gillen of Kings, Ryan of Queens, Higgins of New York, succeeding Hayes of Albany, and Falk of New York, succeeding Dineen of New York, Democrats.

The Senate committee on public service remains the same as last year. The members include Warren T. Thayer of Chateaugay, chairman; Campbell of Lockport, Whitley of Rochester, Hickey of Buffalo, J. F. Williams of Troy, Pitcher of Watertown, Brereton of Essex County, Gates of Chittenango and Majority Leader John Knight of Arcade, Republicans, and Twomey of Brooklyn, Dunnigan of New York, Farrell of Brooklyn and Minority Leader of the Senate Bernard Downing, Democrats.

Lengthening of Local I.R.T. Stations Ordered

An order directing the Interborough Rapid Transit Company, New York, N. Y., to begin work on the lengthening of four local station platforms was announced by the Transit Commission on Jan. 1. These stations are Canal Street, Spring Street, Bleecker Street and Astor Place on the Lexington-Fourth Avenue Line. In this order the commission states that the lengthening of local platforms has become necessary in order to afford adequate transportation. The order marks a new step toward carrying out the commission's order directing the lengthening of all the Interborough local station platforms to a size sufficient for the accommodation of ten-car trains.

Methuselah Lived 969 Years

A pale yellow car lettered in green and red is used effectively as a safety car by the Jamaica Public Service Company in Kingston, Jamaica. An open car, at one time a familiar sight, is the first of its kind to be run on the streets of the island city. Spectators read with interest on the part just above the side step: "It is everybody's business to be careful" and on the letterboard "Methuselah was a careful man and he lived 969 years." The company on its regular trams also displays various accident prevention cards and slogans.

North Shore Line Freight Business Up 25 Per Cent

With the tonnage for the month of December estimated, the freight and merchandise dispatch traffic over the Chicago, North Shore & Milwaukee Railroad totaled about 825,000 tons in 1927 or an increase of 170,000 tons over 1926. This gain is due to the freight facilities afforded by the new Skokie Valley route, which has convenient connections with steam railroads for the interchange of cars.

Prior to the opening of the Skokie Valley route in 1926, the North Shore Line was unable to handle carload freight south of Highland Park because of franchise restrictions in the various municipalities through which it operates. The new high-speed double-track line, however, is constructed on privately owned right-of-way for its entire length. Since the opening of this route, fifteen large concerns dealing in coal, lumber and building materials have located their yards adjacent to its tracks and building operations have flourished.

Another improvement on the North Shore Line has been the development of door-to-door freight service between Chicago and Milwaukee. This service has proved popular with shippers of l.c.l. freight and has made for economy and efficiency in the handling of shipments. Merchandise is placed in steel containers and sealed at points of shipment. The containers, which are semi-steel trailers of 8-ton capacity, are hauled to the freight receiving station by tractors and there mounted on flat cars without removing the trailer wheels. On arrival at destination after an overnight haul the trailers are pulled by tractors direct to the door of the consignee before the seals are broken. New flat cars recently purchased by the railroad accommodate three trailers each.

Some of the buses in the parade in Newark on the day bonuses were awarded operators of the Essex Division

No-Accident Bonuses Awarded in New Jersey

A parade of fourteen buses containing trolley and bus operators marked the ceremonies on Dec. 19 in connection with the awarding of no-accident bonus prizes by Public Service Railway and the Public Service Transportation companies to operators in the Essex Division. The parade was from Lincoln Park to Public Service Terminal, Newark, where more than 800 operators gathered in the auditorium to receive their checks. The night operators received their bonuses in the morning and the day operators in the evening.

The no-accident bonus plan, put into effect in December, 1926, provided $1 a week for each week in the year in which the operator had no accidents. In all the divisions throughout the state $130,000 was distributed. In the Essex Division approximately $42,000 was awarded to 1,580 men.

President Thomas N. McCarter, introduced by James M. Symington, manager of the Essex Division, congratulated the men on their achievement and hoped they would receive larger checks next year. He emphasized the necessity of further co-operation on the part of the city authorities in stricter regulation of parking of private cars so that those who use the trolleys and buses, the great majority, may be transported safely, promptly and economically. Mr. McCarter asked Director of Public Safety William J. Brennan to co-operate to the fullest extent in his power in working out this problem.

Director Brennan also congratulated the operators on their showing under the no-accident plan and asked them to continue to give their best efforts in the cause of safety, guarding those who seem unable to guard themselves.

Fred M. Rosseland, executive manager of the Newark Safety Council, told what his organization is doing in the cause of safe transportation and Matthew R. Boylan, vice-president in charge of operation of the companies, praised the men for their records and asked them to be particularly careful at street intersections, as, he said, 63 per cent of all the accidents occurred at such points.

The playlet prepared by the safety education department, entitled "Whose Fault," was given at each session.

Group of Public Service railway and bus operators (Essex Division) in Newark Terminal auditorium during bonus award presentation

Norfolk's Cars and Buses in New Colors

Virginia Electric & Power Company officials have pointed out the rainbow to the company's master painter and said in effect: "Turn us out some street cars and buses that look like that." Certainly, so far as Norfolk is concerned, the day of the banana-colored street car is over. As fast as the company's rolling stock needs repainting it will be given one or several coats to outshine Joseph's multi-colored one. All cars and buses may be made as gay as the red, white and blue equipment now in service on the Naval Base line at Norfolk. But all won't be red, white and blue. The ten new buses recently ordered by the company will wear a blue, cream and orange dress. Two of them are on their way to Norfolk and the other eight will soon follow. These buses will be used on the Colonial Place line, company officials have announced.

Resumption of Service Demanded of Columbus Interurban

Demand that service under the terms of its franchise be established in Hague Avenue between Broad Street and Sullivan Avenue is made on the Indiana, Columbus & Eastern Railway by City Attorney Leach of Columbus, Ohio. Service was discontinued by the Columbus Railway, Power & Light Company more than ten days ago. The local company had been supplying service for the interurban railway under a contract which has expired. Mr. Leach pointed out that the franchise held by the interurban railway calls for a fifteen-minute city service in those streets. The city attorney said he would wait several days for a definite answer to his demand.

German Visitor Impressed by Chicago Operation

Since the item was published in the JOURNAL for Nov. 19, in which he commented on the railway situation in the United States, particularly in Grand Rapids and Chicago, Herr R. Schwanter, well-known German engineer and assistant director engineer of the Cologne Municipal Railway, has amplified the remarks he made at that time about operation in Chicago and the system there. He said:

I had heard in Germany that the Chicago Surface Lines handled by far the most people in an area with a population of about 3,000,000 with insufficient rapid transit lines. In the Loop, which is the most congested area I have ever seen, street car after street car ran, not crept, sometimes even faster, especially as to acceleration, than competing double-deck buses. The utmost skill is shown in the operation of surface cars, manned by very polite trainmen.

Other interesting features of the Chicago operation were the famous co-ordinated traffic signal system—we say in Germany the "Green wave"—the systematic avoidance of disturbing left-hand turns, the highest average scheduled speed I know of, the densest train schedule, operating like clockwork and without trouble, cars in very good condition, a high standard of maintenance, a fair fare system with its allowance of several changes and last, but not least, the best buses.

I got the impression that there must be excellent co-operation among management, employees and the public. I am convinced, especially by the Chicago Surface Lines, that the day of the last street car is farther away than ever, if managements and employees do not lose courage and energy.

California Fare Hearings to Be Resumed

The third of a series of hearings before the California Railroad Commission on interurban rates for the Pacific Electric Railway, Los Angeles, Cal., will be held on Jan. 17. Since the last hearing, held in October, a comprehensive survey of the properties and the operation of the railway has been under way. Five engineers have been detailed by the Railroad Commission to make this survey.

Particular attention has been paid to the elimination of stops, to speed and to general service. Since the meeting in October more than 100 stops over the entire Pacific Electric system have been eliminated by the commission's recommendation. The commission has in a number of cases recommended an increase in the frequency of service which the company officials have not felt warranted because of inadequate returns from those lines. In no case has any evidence been discovered of wasteful practices.

The company is requesting a raise of approximately 20 per cent in all interurban fares. It bases its request upon the fact that it is not earning an adequate return upon its investment. The company has never paid a dividend. The Southern Pacific, the parent company, a few years ago wiped out a deficit of $15,664,884 accumulated since 1911, when the Pacific Electric was incorporated.

Railway Man to Promote Shipping Interest in Richmond

William E. Wood, president of the Virginia Electric & Power Company, Richmond, Va., has been appointed a member of the Richmond Port Commission. Fred H. Powell, president of the Richmond Common Council, named Mr. Wood, who is already a member of the James River improvement committee of the Chamber of Commerce. The port commission has been created to revive shipping interests of Richmond which in former years contributed largely to the city's commercial development. At one time Richmond's maritime activities extended to all parts of the world. A federal and local survey has recently been completed with the object of deepening the river's channel and providing extensive terminal improvements.

Company at Poughkeepsie Would Sell Right-of-Way for $150,000

The Board of Supervisors at Poughkeepsie, N. Y., has taken preliminary steps to obtain such special legislation as may be needed to permit the county, if it desires, to acquire the right-of-way of the Poughkeepsie City & Wappingers Falls Electric Railway for the widening of the South Road. This end was attained through the acceptance of a report of the board's highway committee on the offer of the railway to sell for $150,000.

The committee recommended that inasmuch as the board had received no information from the State Superintendent of Public Works concerning the reconstruction of the highway and had been furnished with no surveys nor preliminary plans specifying the lands to be needed, no action be taken at this time on the railway offer. The suggestion was made, however, "that the representatives of Dutchess County in the State Legislature attempt to procure any necessity legislation to authorize the Board of Supervisors of Dutchess County to ascertain the amount for which the right-of-way to maintain the trolley road between Wappingers Falls and Poughkeepsie would be abandoned and to appropriate such sums as the Board of Supervisors may determine to pay therefor."

Who Will Win American Waterworks Stock?

A stockholder of the American Water Works & Electric Company, Inc., the controlling company of the Monongahela West Penn Public Service Company, has offered a prize of five shares of common stock for the best article on "What Should My Company Mean to the Public?" Any employee of the American Water Works, or any of its subsidiaries, is eligible for the contest, with the exception of certain high officials.

The competition opened Jan. 10 and closes March 10. Essays must be limited to 1,500 words. Attached to the essay, but on a separate slip of paper, must be the writer's name and the company by which he is employed. The contestant's name, however, must not appear on the article itself.

Hearings on Boston "L" Legislation Begin Jan. 23

The legislative committees on metropolitan affairs and street railways, sitting jointly, have announced that public hearings on all proposed Boston Elevated Railway legislation will open on Jan. 23. The two committees have decided that the Elevated legislation, which is the most important problem before the General Court, should not be allowed to drag through the session, but should be taken care of in the early weeks of the year if possible.

Utility Education in Illinois Public Schools

A total of 33,000 pamphlets on electric railways has been distributed to the schools of Illinois by the Illinois Committee on Public Utility Information. The pamphlet is a revision of similar pamphlets used with success in previous years. It contains a brief history of the development of electric transportation systems and explains in non-technical language the construction of electric street cars and the method of operation. This pamphlet is one of a series issued by the Illinois Committee covering the various public utility services.

Public school teachers and principals have found these pamphlets very valuable in practical instruction of their pupils on subjects relating to public utilities. In connection with the use of the pamphlet on electric railways the Illinois Committee makes some suggestions to school teachers and principals for formal or informal debating and for rhetoric, oral English and current topics classes.

Information Service in Baltimore

As a further aid to the public, the United Railways & Electric Company, Baltimore, has established an information service on the ground floor of the Continental Building, in the heart of the downtown section. This bureau also receives complaints. It was deemed advisable to open the bureau because the offices of the company are scattered on several floors of the building and a person seeking a certain department often experiences difficulty in finding the proper office. At a later date the company expects to enlarge the new department for the sale of car checks and commutation books.

Gary Paper Makes Appearance

Establishment of an employee magazine to be known as the *Treadle* has been announced by the Gary Railways, Gary, Ind. Beginning with the December issue, the new publication will make its appearance monthly, being distributed to each of the 350 employees. The first issue, of four pages, carries news of safety committee work, a new employee training course in elementary electricity, editorials and extensive department personals. It is made up in newspaper style with three columns to the page. Margaret K. Hanlan is the editor.

Service Records in Jackson Rewarded

Service buttons were recently delivered by the Jackson Railway & Light Company, Jackson, Tenn., to 40 of its employees who had been with the company five years and more. Two of the buttons went to men who had been on the payrolls for a quarter of a century, two were for twenty years' service, seven were for fifteen years, nine for ten years, and the remainder for five years.

The 25-year and twenty-year buttons were of gold, the ten and fifteen-year buttons silver and the five-year buttons were bronze. A presentation speech was made by John Wisdom, general superintendent, who drew a 25-year button for his own services.

City Seeks to Recover From the Interborough

Formal approval of a claim against the Interborough Rapid Transit Company, New York, in favor of the city for $9,783,770 was contained in a resolution adopted on Jan. 4 by the Transit Commission. The commission's action is equivalent to starting proceedings to recover this sum, as the amount in question is now automatically placed in a suspense account pending determination by the courts or arbitrators of the merits of the claim. The amount consists of sums charged against operation of the subways and the so-called certificate roads, extensions of lines covered by the dual contracts, which accountants for the Transit Commission contend are improper charges. The position of the Interborough Rapid Transit Company in the matter has been stated previously in the ELECTRIC RAILWAY JOURNAL.

St. Paul Fare Hearing Deferred

Hearing by the Minnesota Railroad and Warehouse Commission of the application of the St. Paul City Railway, St. Paul, Minn., for increase in rate of fare was postponed on Jan. 5 until April 30. The action was asked by Corporation Counsel A. A. Stewart on the ground that the voters will hold a special election on March 13 on a charter amendment to permit the Council to effect relief from certain expenses of the railway such as was recommended at the time the commission announced a valuation and a rate of fare of 8 cents cash and six tokens for 40 cents. Voters have hitherto turned down similar proposed amendments. The property valuation was placed in 1925 at $16,000,000 and the return authorized at 7½ per cent.

Pierce Butler, Jr., representing the city, said the city is acting in bad faith as at the election a proposal will be considered for a municipal bus line, of which business the Twin City Motor Bus Company now has a monopoly. Chairman O. P. B. Jacobson of the commission said leaders for the city in the controversy had estimated the railway property valuation at $9,000,000, and that he intends to find the basis for the figure and reasons for making it public. The proposed relief includes freedom from the cost of paving and maintenance of paving between car tracks and sprinkling amounting to several thousand dollars a year.

Why Only Ten Years More of Life for "Jim" Couzens?

If next August finds him among us mortals, James Couzens, United States Senator, one-time Mayor of Detroit and municipal railway advocate, will have lived one of the last ten years he desires. At least he is reported to have said on his 55th birthday that ten years more of life would be enough for him. His viewpoint is accounted for in the January, 1928, number of *McClure's Magazine* by Allan L. Benson, by whom Mr. Couzens is taken to task.

Railway people remember "Jim" Couzens as that successful young man who resigned as vice-president and general manager of the Ford Motor Company to become president of the Detroit Street Railway Commission, as that fiery municipal railway devotee who later negotiated the sale of electric railway lines to the city and who after serving as Mayor of that city resigned to accept an appointment to the United States Senate in 1922 made by the Governor of Michigan to fill the vacancy caused by the resignation of Senator Newberry.

Mr. Couzens' complaint is that he got out of his element too suddenly, dropped business too early and found too much time with little to do with it. His rise from a car checker in the Michigan Railroad yards at $60 a month to general manager of the Ford company at $150,000 a year covered only a few years in the span of a lifetime.

The writer of the article, who grew up with Mr. Couzens, rejects the philosophy "it is too late to begin" and says it must be exterminated from every life, whether the age be 35, 45 or 55. It is not too late for Mr. Couzens to develop new interests. He who made Detroit a better place in which to live, who devoted much money and time to public service must not relax. As Arthur Brisbane said about him many years ago, "Young in his early 40's, he has many years of useful work ahead and he intends that they shall be working years."

Three-Cent Mileage Rate Sought on Warren & Jamestown

The Warren & Jamestown Street Railway, operating between Jamestown and Warren, N. Y., petitioned the Public Service Commission on Jan. 10 for authority to increase its mileage rate to 3 cents in place of 2½ cents and by increasing the number of fare zones, each with a 5-cent fare. Because of the extensive increase in the number of privately owned automobiles and highway development between Jamestown and Warren the company complains there has been a large decrease in the number of passengers it handles, with consequent loss to the company.

The increase requested by the company is approximately 20 per cent over existing fares. A similar application has been made to the Pennsylvania Public Service Commission.

Recent Bus Developments

Houston's Harrisburg Service to Begin Soon

Express buses to Harrisburg from Houston, Tex., will be put into operation about Jan. 15, Carl Frazer of the Houston Electric Company has announced. Eleven of the fifteen new buses for use on the line had arrived on Jan. 6 and the remaining four were expected at once. The downtown terminus of the Harrisburg line will be at San Jacinto and Preston. There will be express service from Milby to the Harrisburg terminus. The tentative arrangement calls for five to seven-minute service during the rush and ten to eleven-minute service for the off hours. The Harrisburg railway line from 67th Street to the present terminus near Brays Bayou will be retained for several weeks. It is planned to remove the tracks from 67th Street to the terminus when the bus service is perfected.

Appeal on Hoosier Transportation Rights

Notice of the appeal from the decision of the Indiana Public Service Commission to the Superior Court in Indianapolis on the petition of the Hoosier Transportation Company, Inc., for authority to pick up and discharge passengers on West Washington Street inside the city limits of Indianapolis has been filed with the secretary of the commission. The commission recently denied the petition after hearings, during which the Indianapolis Street Railway opposed the plea.

Worcester Consolidated Considers Bus Fare Protest

Residents of Fisherville, Mass., have entered a protest against the bus fare charged by the Worcester Consolidated Street Railway on the line between Wilkinsonville and Fisherville. The fare at present between these points is 20 cents and the distance is about 2 miles. Officials of the railway have taken the protest under advisement.

Substitution of Buses on Providence Line Denied

The petition of the United Electric Railways, Providence, R. I., to abandon railway service between Pascoag and Woonsocket and substitute buses has been denied by the Public Utilities Commission. In summing up the evidence presented at hearings on the company's petition to abandon service to Woonsocket and Pascoag, Chairman Bliss remarked that "if there is a general policy of this company that is in the public interests it should be disclosed in this case as in all other cases." The commission said:

It does not seem to the commission on the facts presented that the petitioner has made out a case of public necessity and convenience, and we do not feel justified in depriving communities of the service in which the town councils are a unit in opposing this move.

The company witnesses testified that this line has shown a loss for a considerable period and that this company believed that bus operation would be profitable.

Business of Gray Line at Toronto Grows

The Toronto Transportation Commission, Toronto, Ont., is doing its share in bringing United States visitors to Toronto by the motor coach service to Niagara Falls and Buffalo. The revenue which Gray Coach Lines, Ltd., received from the Niagara Falls and Buffalo service in October was three times as large as in October, 1926, and in November it was more than four times greater than in the similar month last year.

Shore Line Coach Sold

Routes, station facilities and other holdings of the Shore Line Motor Coach Company, north of the city of Benton Harbor, Mich., were sold recently to the Motor Transit Corporation, Chicago, which operates the Safety Motor Coach Company, the Purple Swan Motor Coach Line and other interurban bus services in the Central West. The Shore Line Motor Coach Company is controlled jointly by the Chicago, South Shore & South Bend Railroad and the Gary Railways. Included in the sale was the Golder Arrow Motor Coach route, over which a de luxe non-stop service is maintained between South Bend, Ind., and Detroit. The Southwestern Michigan Motor Coach Company, Kalamazoo, which has been under the same general management as the Shore Line Company, was also purchased by the Motor Transit Corporation.

With the consummation of the sale on Dec. 31, the operations of the Shore Line Motor Coach Company became confined to northern Indiana and southwestern Michigan, where local permits and franchises are held. The company discontinued its service as of Jan. 1 connecting Benton Harbor, South Haven, Holland, Grand Haven and Muskegon. The Shore Line system consists of extensive motor coach routes in northwestern Indiana adjacent to Chicago. Local transportation is rendered in Hammond and between that city and Chicago, East Chicago, Whiting and Chicago Heights, Ill. Service is also furnished between Gary and Chicago, Gary and Michigan City, Gary and Valparaiso and Michigan City and Benton Harbor.

Shore Line Motor Coach service between Chicago and Benton Harbor will continue to be operated in conjunction with the fast limited train service of the South Shore Line. Shore Line Motor Coach passengers have the option of making the trip between Chicago and Michigan City, en route to Benton Harbor, on the electric interurban railroad, thus saving an hour in time.

Fares Equalized in California City

A certificate has been granted by the California Railroad Commission to the San Diego Electric Railway to operate auto passenger service between San Diego and El Cajon and intermediate points and to increase the fare from Lookout Avenue to Grossmont from 5 cents to 10 cents, and between Lookout Avenue and El Cajon from 15 cents to 20 cents. Other fares will be equalized.

Buses Soon Over Morris County Route

The first of the buses to be substituted for the cars of the Morris County Traction Company between Newark and Lake Hopatcong, N. J., has been received at Dover. O. G. Schultz, general manager of the company, said he expected the other buses before Jan. 15. If favorable action is taken by the Public Utilities Commission on the company's application to run the buses between Maplewood and Newark and for location of a terminal at Park Place, opposite the Hudson Tubes in Newark, Mr. Schultz said it was planned to begin the Morristown-Newark service as soon as the buses are ready. The Morristown-Lake Hopatcong line will begin operation shortly thereafter. Between Summit and Newark there will be a fifteen-minute schedule and an express service is to be maintained between Newark and Maplewood. It is expected there will be a shortening of time in the bus schedule as compared with that now followed by the cars. The bus schedules are being worked out.

Would Transfer Olean Bus Franchise

The Olean, Bradford & Salamanca Bus Line, Inc., holding certificates to operate in Salamanca, between Olean and the New York State line via Limestone, and between Bradford, Jamestown and Salamanca, applied on Jan. 6 to the Public Service Commission for authority to transfer its franchises and property to Alvin R. Bush, Phillipsburg, Pa. The petition states that all of the capital stock of the bus line is owned by the Olean, Bradford & Salamanca Railroad and that the bus line does not possess funds necessary to maintain, improve and operate the bus line.

Financial and Corporate

Merger in New Jersey

Bus and railway lines of Public Service Corporation to be consolidated under title "Public Service Co-ordinated Transport"

THE directors of Public Service Railway and of Public Service Transportation Company, Newark, N. J., have approved an agreement of consolidation and merger which will be submitted to the stockholders of the two companies for their action at meetings to be held on Jan. 31.

A new company is to be created, known as Public Service Co-ordinated Transport. Provision is made for the issuing of 2,500,000 shares of no par value common stock and 487,500 shares of non-cumulative preferred stock of no par value, which will have no voting rights but will receive dividends at the rate of $6 per annum per share, for such years as in the judgment of the board of directors such dividend is justified and before dividends are paid on common stock. In the event of the dissolution of the company its preferred stock is to be entitled to a division of the assets at the rate of $75 a share, before the common stock receives any part of the assets.

President McCarter Comments on Change

Under the terms of the agreement the 487,500 shares of no par value common stock of Public Service Railway outstanding will be exchanged for 487,500 shares of non-cumulative preferred stock of Public Service Co-ordinated Transport, and the 1,004,500 shares of common stock of Public Service Transportation Company outstanding for the same number of shares of common stock of the new company.

Thomas N. McCarter, president of Public Service Railway and Public Service Transportation Company, said in reference to the merger:

The consolidation of Public Service Railway and the Public Service Transportation Company into Public Service Co-ordinated Transport is a forward step in improving local transportation conditions. It will, in the opinion of the directors of the two companies to be merged, accomplish two important objects. First, a further co-ordination of street car and bus service with resulting economy and efficiency, and, second, an improvement of financial structure, including the possibility of an open end mortgage, which will make it easier to secure new capital for extension and betterment of facilities. The merger of Public Service Electric Company, Public Service Gas Company and United Electric Company of New Jersey into Public Service Electric & Gas Company has demonstrated the benefits of this character of consolidation, which is in the interest of the public as well as the stockholders.

The large increase in the number of passengers carried by Public Service cars and buses during 1927 demonstrates the demand for adequate transportation facilities, and experience gained through the operation of both kinds of vehicles shows clearly that co-ordination of service is necessary in order to meet these demands adequately. This co-ordination, the merger of the two companies will assist in securing.

Traffic, Fare and Wage Figures

No reduction in the rate of decrease of electric railway traffic during November, 1927, was noted. Compared with a similar month of 1926 the rate of decrease is somewhat greater than reported in the previous months of the year, with the exception of July. The number of revenue passengers, including bus passengers, reported by 190 companies for November, 1927, compared with November, 1926, is as follows:

November, 1927	759,463,443
November, 1926	779,126,980
Decrease, per cent	2.52

The average cash fare in cities of 25,000 population and over:

	Cents
Dec. 1, 1927	7.9993
Nov. 1, 1927	7.9846
Dec. 1, 1926	7.7643

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate Cents	Index Number 1913 = 100 Per Cent
Dec. 1, 1927	57.27	210.17
Nov. 1, 1927	57.27	210.13
Dec. 1, 1926	56.88	208.73

Winona Line to Issue $260,000 Notes

Authority to issue and sell $260,000 of its 6 per cent ten-year gold notes was granted the Winona Railroad, Warsaw, Ind., on Dec. 31 by the Indiana Public Service Commission. Under the terms of the commission's order, the securities are to be sold at 94 per cent of their par value. Proceeds from this sale will go to reimburse the railroad's treasury for additions to properties already made.

Tulsa Tax Claim Settled

Tulsa, Okla., presented the Tulsa Street Railway with a receipt in full for more than $30,000 of long overdue franchise taxes in exchange for a check for $3,000. In return, the railway agreed to remove immediately the block to progress which has existed on the east side of the city since 1914. The company will lay new double tracks and pave its portion of the street for the unpaved distance of six blocks. New 80-lb. steel rails will be used. Franchise taxes have been accumulating for several years, but the company has been unable to pay them. The recent increase in fares enables the company to pay expenses and make some necessary improvements.

Financing Plans Completed at Alliance

Plans for refinancing the Stark Electric Railroad and retiring an old bond issue were approved at a special meeting of stockholders held recently at the railway offices in Alliance, Ohio. The refinancing will be done with a $500,000 7 per cent bond issue and $250,000 of preferred stock, both of which were approved by the Ohio Public Utilities commission.

Directors of the Stark Electric were authorized to proceed to complete a contract between the Stark Electric and the Alliance Power Company, so they may be submitted at the annual meeting of the stockholders to be held on Jan. 19. The Alliance Power Company, organized several months ago, has taken over and is operating electrical generating equipment formerly owned by the Stark Electric. State commission officials have approved the proposed contract, which includes an easement right-of-way from Louisville to Damascus, a distance of 16 miles, to be purchased from the railway for $22,500.

Amusement Plot Sold by Tri-City Railway

The Tri-City Railway, owner of the Black Hawk Watch Tower at Rock Island, Ill., has sold the 177-acre tract to the state of Illinois for $200,000. The state will convert the plot into a park preserve similar to Starved Rock. The railway at one time operated the property as an amusement center.

Confirmation of Twin City Details Sought

The annual meeting of the stockholders of the Twin City Rapid Transit Company, Minneapolis, Minn., will be held at Jersey City, N. J., on Feb. 28, 1928. At this meeting officers will be elected and other business transacted, including such action as may be necessary or convenient legally to prevent any sale or transfer, pledge, hypothecation or other encumbrancing of the shares of stock of the Minneapolis Street Railway and the St. Paul City Railway, owned by the company, or any interest therein, so long as any of this company's first lien or refunding 5½ per cent gold bonds, series A, remain outstanding and unpaid without the consent of the trustees named in the trust indenture securing said bonds. Action will also be taken to secure legally the retention by the Central Union Trust Company, New York, with which the shares are now on deposit.

Aggressive Policy Helps New Haven

According to the *Wall Street Journal* a shift in the winds of public sentiment in the past few years, and more particularly the stand of a courageous and aggressive management prevented further sale of outside properties of the New York, New Haven & Hartford Railroad at receivership prices, checked disintegration of the New Haven system and afforded opportunity to work out the problem of its investments. The management is making every effort to develop these properties to best advantage, to salvage and build up values. The same authority says that the comeback of the Boston & Maine Railroad and other properties in which the New Haven Railroad is interested inspires reflection as to what it would have stood to lose had it been forced out of these as it was out of the Rhode Island trolleys, Eastern Steamship and Merchants & Miners Transportation Company, all sold at a heavy sacrifice.

It will be recalled that under pressure from the government through a suit brought under the Sherman anti-trust law the New Haven management of that day, under the famous "consent" decree of 1914, was divested of virtually all extraneous properties. These included the Boston & Maine, controlled through the Boston Railroad Holding Company, the Connecticut Company, operating the Connecticut trolleys; the Rhode Island Company, the Berkshire Street Railway, the Vermont Company, the Westchester Street Railway, the New York & Stamford Railway and the New England Investment & Security Company, which controlled the Springfield Street Railway and the Worcester Consolidated.

In 1925, the dissolution decree was nullified completely by the court, which directed the handing back to the New Haven of the Connecticut Company, the New York & Stamford Railway, the Berkshire Street Railway, the Vermont Company and the New England Investment & Security Company, controlling the Springfield Street Railway companies and the Worcester Consolidated.

The *Wall Street Journal* says:

The Connecticut Company for many years has earned its fixed charges and something over on its $40,000,000 stock, which is owned entirely by the New Haven. Its total investment in this company is above $45,500,000, but the independent appraisal which is being made of the value of the Connecticut Company properties indicates that the valuation will more than support New Haven's investment therein.

While the court order permitted return of the Springfield Street Railway and the Worcester Consolidated, the New Haven also had to get special legislation in Massachusetts and authority from cities and towns served to resume operation of these properties. These were secured, the New Haven stating that it was prepared to expend $1,000,000 on each of the properties for their rehabilitation and development. It has made many improvements, supplementing railway lines with bus lines and adding new equipment.

Thus the New Haven management has gone ahead making the most of its opportunities for service, preserving the integrity of its property and developing its outside investments.

Decline in Traffic in St. Louis in November

The number of passengers carried by the United Railways, St. Louis, Mo., fell off 1,359,276 in November compared with a similar month in 1926, according to statistics compiled by the St. Louis Public Service Company, which succeeded the United Railways on Dec. 1. The figures were 21,098,039 and 22,457,315. An 8-cent base fare with two tokens for 15 cents was granted the company by the Missouri Public Service Commission on the assumption that the new rates would yield the company $119,056 a month more than the old rate of 7 cents straight. Figures for November show that an increase of only $16,729 was realized.

$19,610 for Municipal Railway Equipment at New York

The public auction sale of trackless trolley cars and trolley cars held by the Department of Plant and Structures, New York City, N. Y., on Dec. 5, 1927, and continued on Dec. 28, 1927, resulted in the disposition of the material used by the city in municipal railway operation in five lots.

Lots 1 and 2 were awarded to L. Schiavone and Bonomo Brothers, Jersey City, N. J., the highest bidders, as follows:

Lot 1. Seven Atlas trackless trolley buses, stored at carhouse at Concord, Staten Island, N. Y.	$385
Lot 2. Fifteen Brockway trackless trolley buses. Ten stored at carhouse at Greenridge, S. I., and five stored at carhouse at Concord, Staten Island, N. Y.	825
Total	$1,210
Lot 3. Thirty-eight Birney type trolley cars, stored at carhouse at Concord, Staten Island, N. Y.	$6,000
Lot 4. Fifteen Second Avenue type trolley cars, stored at carhouse at Concord, Staten Island, N. Y.	2,400
Lot 5. Thirty-three Birney type trolley cars, stored at Williamsburg Bridge carhouse, Bedford Avenue, between South Fifth and South Sixth Street, Brooklyn	10,000
Total	$18,400

Decrease in Riding in Decatur

Car lines in Decatur, Ill., operated by the Illinois Power & Light Company, showed a marked decrease in transportation in 1927, despite the small decrease in total mileage. The mileage was 998,638, a decrease of 52,500 miles, and the passengers numbered 5,112,457, a falling off of 456,000. Approximately 20 per cent of the passenger travel was on transfer.

Would Abandon Nine-Mile Line in New Hampshire

The Massachusetts Northeastern Street Railway has petitioned the Public Service Commission of New Hampshire to abandon railway service on certain of its lines in that state. The particular line set forth in the petitions names the railway route between Plaistow and Rowes Corner in Newton, a distance of 9 miles. In its petition for abandonment the company claims it sustained a loss on this line in 1926 of approximately $9,000. Operating expenses were decreased during 1927 by making fewer runs over the line and the loss was not so great.

Binghamton Sale Put Off

Sale of the properties of the Binghamton Railway, Binghamton, N. Y., has been indefinitely postponed. At first the sale under foreclosure proceedings was set for Dec. 1, 1927, and later was deferred to Jan. 5, 1928. The railroad proper consists of 47.72 miles of single and double track.

Report Issued on New York State Operations

The New York State Railways, operating in Rochester, Syracuse, Utica and Uneida, reports a net income of $529,006 for the year ended Dec. 31, 1926, against a net of $760,138 for the year previous. Contained in the report is a comparative statement of the earnings and expenses for 1926 and 1925, which is shown herewith.

SUMMARY OF OPERATIONS OF THE NEW YORK STATE RAILWAYS FOR THE YEARS ENDED DEC. 31

		1926		1925
Railway operating revenues		$10,351,484		$10,027,906
Railway operating expenses (including depreciation)		7,588,755		7,199,139
Net revenue railway operations		$2,762,728		$2,828,766
Net revenue auxiliary operations		495		1,247
Net operating revenue		$2,763,224		$2,830,014
Taxes assignable to railway operations		659,422		695,146
Operating income		$2,103,801		$2,134,868
Non-operating income		*$38,194**		132,942
Gross income		$2,065,607		$2,267,810
Deductions from gross income		1,536,601		1,507,671
Net income		$529,006		$760,138
Sinking fund appropriations		31,603		32,664
Dividends 5 per cent cumulative preferred stock (see note)	(5%)	193,125	(5%)	193,125
Earned on common stock	(1.52%)	$304,278	(2.68%)	$534,349

Note: 2½ per cent paid in 1925, none paid in 1926.
*Adjustment of excess of specified return under service-at-cost contract, city of Rochester.

Book Reviews

Mundy's Earning Power of Railroads

New York and Chicago: James H. Oliphant & Company, 1927. 568 pages.

The 22d issue of the Floyd W. Mundy compilation is a comprehensive study of stocks, funded debt, mileage, revenues, expenses, maintenance, dividends, valuations and other important factors in the earning power of one of the greatest utilities. In the interest of the investor these statistics are arranged to give the best available information on the value of stocks or bonds of any railroad and to permit easy comparison.

Engineering of Power Plants

By R. H. Fernald and G. A. Orrok. Third edition. New York: McGraw-Hill Book Company, Inc. 663 pages. Price, $5.50.

Twenty-six chapters in this book outline the whole power-station field as it exists today and introduce to readers the equipment available and the present practices in power-station design. All through the book an economic and commercial rather than a theoretical point of view is found. The authors discuss power plants in terms of equipment or of application. While primarily a college text book, there are many engineers who will find it valuable.

Electrical Power Transmission—Principles of Design and Performance

By E. A. Loew, professor electrical engineering University of Washington. New York, N. Y.: McGraw-Hill Book Company. 400 pages. Price, $4.

The first seven chapters are devoted largely to a discussion of the mathematical tools and the underlying circuit theory of the transmission line. The last seven chapters discuss the mechanical features of line design with a study of the economics of line design as influenced by both the mechanical and electrical features.

Transactions of the National Safety Council

Sixteenth Annual Safety Congress, held in Chicago, Sept. 26 to 30, 1927.

Proceedings of the 1927 Safety Congress are published in several parts. The one of most interest to electric railway men, naturally, is the report of the Electric Railway Section, comprising 88 pages. Other sections, of nearly as much interest, are the Public Utilities Section, the General Sessions, and the Transactions of the National Safety Council (Public Safety Division). Those that took part in the Electric Railway Section are prominent in the electric railway field, and the discussions and papers are intensely practical.

The Principles of Bond Investment

By Lawrence Chamberlain and George W. Edwards. New York, N. Y.: Henry Holt & Company. 700 pages. Price, $7.50.

For sixteen years Chamberlain's "The Principles of Bond Investment" was known as "The Bible of Wall Street." It was the precursor of a long list of similar books. Since the original book was written, however, there has been a period epochal in that it has witnessed a world war, a new banking system and a system of taxation that is virtually new.

Moreover, certain industries have in the meantime atrophied, others have been created, old types of securities have disappeared, others have assumed greater importance and new types have sprung into being. In consequence almost all the old matter has been rewritten and a number of new chapters have been added. In the book as it is now rewritten, the intricate subject of taxation has received the attention that it deserves. If the investment trust appears to have been neglected, that is only because this practice applied to the idea of diversification is still too young as a practice in the United States to warrant its inclusion.

So much for the book in general. To be more specific, there is an excellent chapter "Public Utility Securities" also a special chapter "Street Railway Bonds." In both of these public utility operators will be interested, but electric railway men particularly in the authors consideration of street railway bonds. Naturally the attention given to this subject in a work of this kind is not exhaustive, but the conclusions are very much to the point, borne out by many quotations, not a few of which are from the ELECTRIC RAILWAY JOURNAL.

Some of the inherent defects in street railway bonds under the old form of mortgages are pointed out, but the authors say that during the last decade changes in the financial structure of electric railways, as in practically all utilities, have eliminated many undesirable features. They hold to the view that the investor should not turn away because of the many failings of the electric railway class, but rather that he should remember that there are numbers of splendidly equipped and well developed companies with records and capacity for earning beyond question. In conclusion they say that only men of affairs capable of diagnosing reports, and seeking a large return from a form of investment that is fairly convertible, should seek to meet their needs with electric railway bonds. Of incidental interest to electric railway operators is the chapter in which the authors discuss equipment trust obligations.

Despite the growth of investment literature in recent years "The Principles of Bond Investment," with all due respect to other treatises, appears to be in no danger of having its previous place as "The Bible of Wall Street" ursurped by any other aspirant to such honors. It is still the classic volume in its own field.

Die Elektrifizierten Hauptlinien der Schweizerischen Bundesbahnen

By J. Göttler. Berne: Bolliger & Eicher, Price, 2 Swiss francs (40 cents). 56 pages, illustrated.

This is a technical account of the electrical equipment of the Swiss Railways brought up to date. It gives a general review of the work, accounts of the power stations, transmission systems, substations, overhead conducting system and locomotives, with some particulars of the results of operation, cost and financial results.

Employee Magazines in the United States

Prepared and published by the National Industrial Conference Board, Inc., New York, N. Y. 89 pages. Price, $1.50.

Analysis of a large number of employee magazines was made in order to prepare this digest of ways and means of publishing them. Considerable help was received from a number of editors of successful publications of this sort. Their advice and views are printed at some length, as well as the judgments of the compilers.

Deutscher Reichsbahn-Kalender for 1928

Published by the German State Railway Company, Berlin, Germany.

The German State Railway has issued an attractive calendar for 1928 with three leaves per week, or 156 altogether. It is illustrated by views of places reached by the system, with some historical views. Illustrations of electrically equipped lines are included.

Water Power Bonds—1927 Edition

New York: Minsch, Monell & Company, Inc. 90 pages.

Statistical data including descriptions, a table of comparisons and a chart are featured in this sixth edition. Information is collected in regard to water power development, 55 hydro-electric companies and the securities of the latter as investments. The booklet is intended for the investor and layman "who cannot be expected to be acquainted with the technicalities nor the common phraseology of the hydro-electric industry."

Personal Items

J. B. Potter Made Manager at Wilkes-Barre

J. B. Potter has resigned as manager of the Bridgeport and Norwalk divisions of the Connecticut Company's railway and bus lines, effective on Feb. 1, to become general manager of the Wilkes-Barre Railway, Wilkes Barre, Pa. Mr. Potter will be succeeded at Bridgeport by Frank L. Kibling.

After he was graduated from Cornell University Mr. Potter went with the Westinghouse Electric & Manufacturing Company. Here he learned the rudiments of the electrical industry, and from 1898 until 1900 he was an engineer for Sanderson & Porter, New York. He next entered the railway industry as superintendent of a line operating between Worcester, Mass., and Central Village, Conn.

In 1907 Mr. Potter became manager of the New York & Stamford Railway and the Stamford and Norwalk divisions of the Connecticut Company and remained in these posts for a period of ten years. In 1917 he was appointed manager of utilities for Sanderson & Porter, New York. He resigned this position in July, 1919, to become engineer in charge of economies of the Federal Light & Traction Company, New York. In 1920 he returned to the Connecticut Company as manager of the Bridgeport and Norwalk divisions.

Mr. Kibling, who succeeds to the managership, has been with the Connecticut Company since 1905. He started as a motorman. In 1909 he was appointed starter and subsequently became chief instructing motorman. In 1912 he was made dispatcher and in 1914 became superintendent, the position from which he is promoted to succeed Mr. Potter.

Changes on California Commission

Following the custom heretofore established of rotating the presidency of the commission each year, Ezra W. Decoto retired Jan. 3 as president of the California Railroad Commission and Leon O. Whitsell was elected president for the year 1928.

President Whitsell has been a member of the Railroad Commission since 1925 and was reappointed for a full term of six years by former Gov. Friend W. Richardson on Jan. 1, 1927. He was appointed from Orange county where he was a member of the Board of Supervisors. He was a practicing attorney for many years before engaging in citrus growing in southern California. He resides at Burlingame.

F. O. WHITEMAN, service agent of the East St. Louis & Suburban Railway, East St. Louis, Ill., and its subsidiaries, was recently appointed superintendent of service. This appointment placed him in charge of the transportation department in addition to his duties in the passenger and freight departments. His office was removed from the Eads Bridge station to the main office.

J. C. Guild, Jr., New Chattanooga Manager, Well Known in South

Jo Conn Guild, Jr., whose appointment as general manager of the Tennessee Electric Power Company, Chattanooga, Tenn., to succeed the late B. C. Edgar, was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Jan. 7, is widely known in Nashville, Chattanooga and elsewhere throughout the State. For the past 4½ years he has

J. C. Guild, Jr.

served the Tennessee Electric Power Company as vice-president.

The new executive upon leaving Vanderbilt University in 1908 engaged in construction work at the Hales Bar power plant. This project was one of the outstanding engineering achievements of its character in the South. Mr. Guild was identified with the work during the last four years of the project, holding at the completion of the work the position of assistant resident engineer. Immediately thereafter, in 1913, Mr. Guild entered the employ of the Chattanooga & Tennessee River Power Company in Chattanooga in new business development work, with special attention to the sale of electric power to the new and expanding industries in his home city.

In 1915 he was appointed to the post of general manager. Several years later, when the Chattanooga & Tennessee River Power Company was consolidated with the Chattanooga Railway & Light Company and Tennessee Power Company into the Tennessee Electric Power Company, Mr. Guild became vice-president of the combined companies. In the meantime he had become closely identified with the growth and development of Chattanooga's business life.

Mr. Guild, of distinguished ancestry, was born and reared in Chattanooga. He received his early education at the Baylor School in that city, later matriculating at the University of Virginia. After two years he transferred to Vanderbilt University in the engineering course.

His contacts with the public in general early made Mr. Guild, like his predecessor, a firm believed in the policy of maintaining good public relations between the power company and the customers it serves. He frankly advocated the widest possible dissemination of information regarding the affairs, policies and progress of the Tennessee Electric Power Company through the press. As a result, in the fall of 1923, Mr. Guild was designated, in addition to his other duties, to supervise the sale of the company's preferred stock on the customer-ownership plan.

The new executive has been closely associated with the late Mr. Edgar in all of the operating problems and policies of the company and is considered fully qualified by experience, ability and training to take over the reins of one of the largest concerns of its kind in the South.

New Assignments in Fort Worth

A. J. Rowe, assistant manager of the Northern Texas Traction Company, Fort Worth, Tex., has been made assistant superintendent of transportation in a new schedule of personnel changes announced by A. F. Townsend, manager of the company.

A. A. Chamberlain, in addition to his duties as assistant treasurer, has taken on the new duties of general passenger agent and supervisor of advertising.

F. W. Mayborn will be actively engaged in advertising work, though continuing in his capacity as assistant general passenger agent.

C. H. Bowen remains as superintendent of city transportation.

L. H. Church With "Journal" Staff

Leonard H. Church, with the editorial staff of the *Electrical World* for the past year and a half, first in New York and more recently in Cleveland, has been appointed editorial representative of the ELECTRIC RAILWAY JOURNAL in Chicago, with the title of assistant editor. For three years before he assumed editorial duties in New York, Mr. Church was a member of the faculty of the electrical engineering department of the Kansas State Agricultural College, Manhattan, Kan. In addition to his academic work Mr. Church, while he was in the West, served as a consulting engineer on the Red Wing rural project in Minnesota and specialized in rural electrification in Kansas.

Manufactures *and the* Markets

$529,655 Budget at Houston

The 1928 budget of the Houston Electric Company, Houston, Tex., lists expenditures totaling $529,655. The budget is $125,000 more than the 1927 budget. Important features in the 1928 plan of the company include removing the carhouse at Texas and Brazos and relocating on the old circus grounds on Silver and Sabine, placing $181,000 worth of buses on the Harrisburg line, building a big garage at the Texas and Brazos carhouse, erecting a steel trestle over White Oak Bayou, etc.

More land has been acquired by the company in the rear of its present carhouse at Texas and Brazos and the garage and machine shop will be built over all the area.

The interurban station and express house will remain on the present location. Contract for paving the gravel portion of Texas Avenue from Louisiana to the bayou and in front of the interurban office has been let.

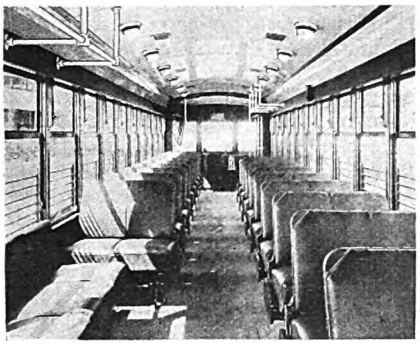
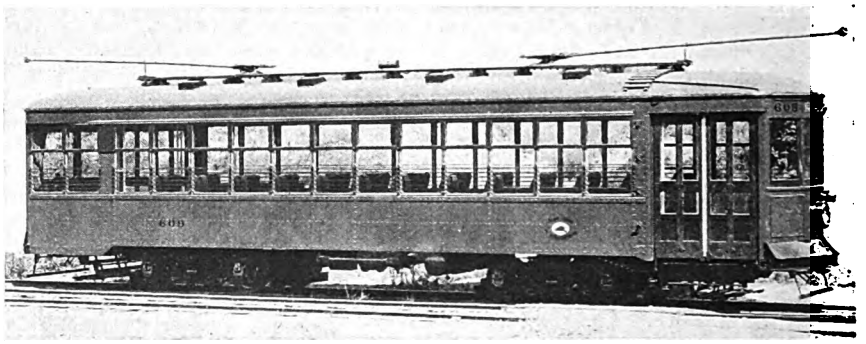
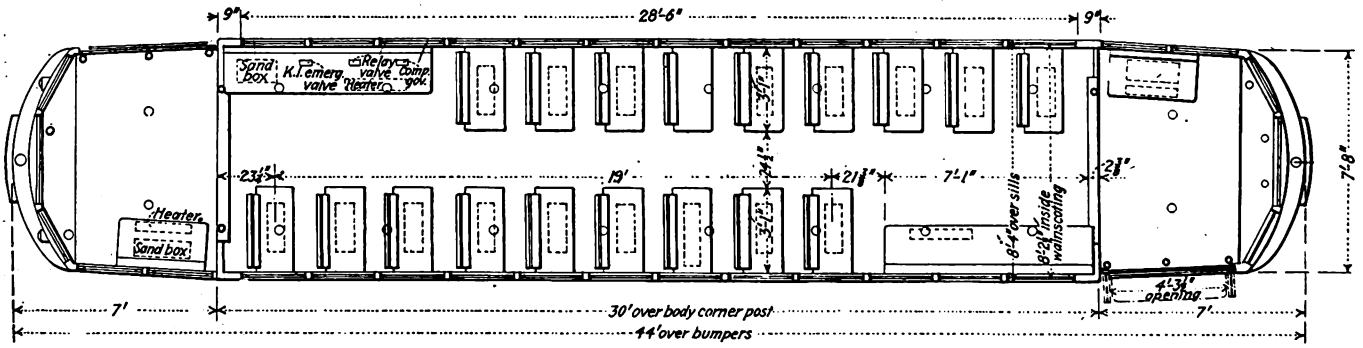
Eight Attractive Cars for Beaver Valley Traction





Interior and exterior appearance of the eight units delivered last fall to the Beaver Valley Traction Company



The cars are 44 ft. 4 in. over all and seat 50 passengers

Supplementing the preliminary specifications published in the JOURNAL for June 25 are the above illustrations showing the type of one of the eight one-man, two-man double-truck cars ordered by the Beaver Valley Traction Company, New Brighton, Pa., in May, 1927. These units were manufactured by the Osgood-Bradley Car Company, Worcester, Mass., and delivery was made in September. As noted in the JOURNAL of June 25, the order for these units followed the rehabilitation of ten of twenty recently purchased cars which were found not to conform to the standards of ease and refinement set by the company for its patrons. The cars have an over-all length of 44 ft. 4 in. Entrance and exit doors will be on the right side only.

The units are of semi-steel construction and are driven by Westinghouse No. 510-E inside hung motors. The exterior color scheme is in orange and the interior trim mahogany. The most modern safety devices have been installed. Revised specifications are as follows:

Name of Railway	Beaver Valley Traction Company, Beaver Falls, Pa.
Number of units	Eight
Type of unit	One-man, two-man, motor, passenger, city, double end, double-truck
Number of seats	50
Builder of car body	Osgood-Bradley Car Company, Worcester, Mass.
Date of order	May, 1927
Date of delivery	Sept. 8 to 15, 1927
Bolster centers	20 ft. 0 in.
Length over all	44 ft. 4 in.
Length over body posts	30 ft. 0 in.
Truck wheelbase	5 ft. 6 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	11 ft. 1¼ in.
Window post spacing	28¼ in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse
Armature bearings	Plain
Axles	3¼-in. x 6-in. journals
Car signal syst.	Consolidated Car Heating Company
Compressors	Westinghouse DH-16
Conduit	Transite lined cable boxes and Duratube
Control	Westinghouse
Couplers	Metropolitan drawbars
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Railway company's standard
Finish	Paint
Floor covering	Battleship linoleum
Gears and pinions	Westinghouse
Glass	¼-in. crystal
Hand brakes	Peacock staffless
Heaters	Consolidated Car Heating Company

Slaying the Four Dragons of Maintenance

SYMBOLIC of the power of evil or of evil itself was the dragon in ancient mythology. Legends were built around heroes who were reputed to have met and slain the dragons. Is it too great a strain on the imagination to picture the modern equipment executive as a Siegmund and the destructive forces as the dragons which he must set out to slay? For that is just what he must do—attack the destructive agencies which beset his rolling stock.

Four dragons lying athwart his path are wear, corrosion, vibration and dirt. Ill appearance and discomfort are allied demons, but with the other four out of the way, it is easy to turn attention to them. The other maintenance demons will succumb only to analysis and deep study.

Look briefly over the four maintenance dragons. Wear is probably uppermost in everyone's mind. Little that can be proposed is new. There is one development to which attention is called, the plating of wearing surfaces with chromium. Quite possibly this process holds possibilities of effecting marked economies.

Corrosion comes next. Steel construction in car building has become practically standard. The underside of a car is subject to the corrosive effects of water spray loaded with salt, alkalies and sometimes acids. Then there always is a coating of dust to retain these destructive agents. Steel sheathing, tee posts and pipes have often been known to corrode to the point of destruction within seven years. Rust-repellent steel has been developed to the point that it is available and its use is advisable. Steel with a copper content of 0.18 per cent shows markedly less corrosion than ordinary steels. Interesting tests on this subject are reported in Vol. 22 and Vol. 23 of the A.S.T.M. *Proceedings*. From them the economy to be obtained by the use of such steel can be determined.

Next comes vibration. It is a dragon of such ferocity that it tests the mettle of any engineer. In fact, it has so many elements of destructiveness that it will be made the subject of a separate editorial. Sufficient here to say that it can be met and overcome.

The fourth dragon is dirt. In the pathway of the equipment man dirt serves but one useful purpose, to show him the loose parts. For this purpose it is of great value. But dirt—meaning grit—is the greatest enemy of wearing parts. If bearings, guides, clevises and similar wearing parts could be protected absolutely against dirt their life would be prolonged greatly. Fenders over car wheels have been used to great advantage to keep dirt from moving parts. Alemite or similar lubricating systems have been used successfully for brake hanger pins and the like so as to form a grease seal to prevent the entry of grit. As the grease is forced from the inside to the outside clean grease is always present to protect the bearing surfaces and the new grease tends to force out any particles of grit that may have worked in.

So it is not too much to believe that these four dragons can be slain or driven back to their lair. If they are overcome the equipment man will have reached a point far nearer to ultimate perfection and will have obtained not only increased economy but a greater ride sales value for his equipment.

Vibration a Destructive Agency

VIBRATION as a destructive agent is not fully appreciated. This is evident because so little has been done to combat it. It becomes manifest in cracked or broken axles, fatigue and fracture of many other parts throughout the car and track structure, and in noise. If of low frequency it may directly produce discomfort to the car rider. The great trouble with failures due to fatigue of metal, the direct result of continued vibration, is that breakdown does not occur until after the lapse of considerable time. The vibration is all too often looked at as a matter of course and steps are not taken to minimize the evil.

The remedies for vibration, so far as it applies to the maintenance of cars, may be summarized as reduction of gross weight, reduction of unsprung weight, greater care in selection and treatment of steel and other structural materials, more careful construction and cushioning. The factors of weight determine the amplitude of the vibration wave. It is obvious that the lower this amplitude the less will be the destructive action and the greater the life of the structural part.

As to quality of material, first cost is too often allowed to overshadow the value of long life. The question of metallurgy must be given deep thought if the maximum economic value is to be obtained. Often a change to a steel much better adapted to the purpose can be made at little or no additional cost. Likewise more careful engineering in the proportioning of parts is of value. In other words, in ordinary design too much is left to guesswork and rule of thumb methods.

From a construction standpoint, there is much need for closer fits. If wearing parts such as bearings and clevises are well fitted there is little tendency for them to set up vibration with consequent wear, fatigue of metal and noise. For example, a loose fit of an axle bearing not only allows grit to enter, but it permits the bearing to vibrate and add hammering to the normal frictional wear. The vibration within the bearing tends to crystallize it and cause fracture. The vibration is transferred to the armature leads, causing breakage there, and also to the gear case, to bolts and to dozens of other

This is the issue in January that is devoted essentially to maintenance and construction subjects

Digitized by Google

parts, each in turn suffering for the sin of the loose bearing.

Another constructional feature having to do with vibration is the item of fillets. While fillets cannot stop vibration they certainly minimize its effects by distributing stresses and preventing localized bending. Fillets should be of the largest practicable radius and should be true segments of circles, ending in tangents.

All parts should be machined carefully and fitted tightly. A construction cannot be kept tight if an unfinished casting is bolted or riveted directly to a rolled section, because the contact between the two consists of several points instead of a flat surface. Subsequent vibration is sure to imbed these points into the opposing surface with resultant loosening and added wear, vibration and noise. The only practical way of making a permanently tight joint between unfinished parts is to interpose a layer of soft material such as canvas dipped in linseed oil paint. If the compressive strains are too great for such treatment the sole alternative is careful machining of the parts coming in contact. Another aid to the maintenance of tight fits is use of the new American Standard fine threads. Bolts can be made of better steel and finished under the heads where practicable.

The final element in reduction of vibration is the use of springs and cushions. To be effective springs must absorb much of the vibration. Today much attention is being paid to rubber as a supplement to spring action. It has been used between the halves of elliptic springs, on the end supports of semi-elliptic springs, in center bearings, in quarter bearings and even in wheels. Much of this is in the experimental stage, but it gives promise of real results in the near future. If rubber can be used successfully in wheel construction it will go a long way toward reducing the effective unsprung weight of the car.

In the final analysis vibration means fatigue and rapid ageing of parts, accelerated wear and noise. And noise in turn is the sure signal that something is wrong.

Where the Maintenance Money Goes

QUESTIONS are often asked as to the division of expenditures in the various maintenance departments between materials and labor. While it has been possible to make the segregation for any one company, it never has been done for the industry with any degree of exactness. In the estimate of expenditures for the coming year, published last week, it was possible for the first time to make an accurate division between maintenance materials and maintenance labor. The results are quite decisive as indicating trends and conditions in various railway departments.

The total expenditures on maintenance accounts are divided in the proportion of three-sevenths materials and four-sevenths labor. The underlying reason for this high proportion of labor is, of course, due to track construction, in which the greater portion of the materials, such as sand, rock and paving materials, bulk large. The work of preparing and placing these materials naturally is a major part of the total cost of the work.

In car maintenance the proportion of material is also low, being some 45 per cent. Contrasted with this, the materials for bus maintenance constitute almost 59 per cent of the total. While in general the processes of repair on cars and buses are similar, here is an indication that bus parts are in large measure finely machined specialties using high-grade materials, while cars include many more foundry and forge shop products of lower grade materials and much rougher finishes.

Obviously there is a field for better car design. While the production of cars is mainly in small orders, there is room for standardization and refinement of parts so that there is less bulk and weight to give needed strength. It may be, of course, that another reason for the higher proportion of labor in car maintenance is due to the manufacture of repair parts in the railway shop, a practice which this paper has always advised against and which is frequently very deceiving in the matter of costs. In any event, the figures indicate that there is a need for further investigation to find if the costs of car maintenance cannot be further reduced by the purchase of more finished parts and the use of less labor, as contrasted with the practice of home manufacture and patching.

Recommendations Growing Out of the I. C. C. Bus Inquiry

INTEREST will run high among all carriers in the reports and recommendations of Attorney-Examiner Flynn of the Interstate Commerce Commission on the subject of the bus and truck engaged in interstate commerce. The findings and conclusions set out in the report are merely tentative. At the hearings more than 5,000 pages of testimony were taken from more than 400 witnesses. This fact is cited merely to indicate the mass of material which had to be considered and to convey an idea of the task before the attorney-examiner in formulating his conclusions.

With these conclusions, in general, there is no cause for quarrel, however much a specific recommendation here and there may be subject to differences of opinion. The conclusions, published elsewhere in this issue, should be read carefully even by those to whom it would now seem they do not apply and by those to whom it would seem they are never likely to apply. It is a changing world and the subject of the motor carrier is by far so big that no one engaged in transportation can afford not to be well informed about the matter and its possible ramifications.

One of the suggestions made is that regulatory intervention by the government is necessary. It is proposed that state regulatory commissions take joint jurisdiction and that joint boards representing two or more states should act when operations extend across one or more state lines, but if the commissions failed to accept authority the Interstate Commerce Commission should act with original jurisdiction. On the decision of such boards, right of appeal to the Interstate Commerce Commission would be allowed. The regulation would apply equally to independent operators and to railroads or public utility companies, and operations would not be allowed until the board had found them necessary in the public interest. Operations begun before March 2, 1925, would be considered as established. If any state refused to apply the regulation, the Interstate Commerce Commission would act for its territory in fixing rates and charges and over the supervision of operation.

Not the least interesting part of the report is the review of the effect of changing conditions on the common carrier. It is significant that during the period since 1921, the number of electric railways reporting to the Interstate Commerce Commission decreased from 312

Digitized by Google

to 259 in 1926. During the same interval the operating revenue of the electric railways reporting to the commission decreased from $235,656,072 to $194,860,470, or 17.31 per cent, and electric railway operating expenses of these properties decreased from $189,450,749 to $163,210,222, or 13.85 per cent. The passenger revenue decreased from $193,166,389 to $140,536,857, or 27.25 per cent. As Mr. Flynn points out, however, there was a steady increase in freight revenue during the same period. Returns from this source were $28,585,712 in 1921, and $39,794,714 in 1926, an increase of 39.21 per cent.

As indicated in an editorial in the JOURNAL for Dec. 31, 1927, the matter of the regulation of interstate buses is again before Congress. At that time, some of the reasons for regulation were reviewed. The concern now is with the contents of the report of Mr. Flynn, and with his thirty recommendations. As he indicated, and as ELECTRIC RAILWAY JOURNAL said, public policy demands the fostering and preserving of motor vehicle transportation in its full vigor, but the same public policy requires that there shall be regulation, with a wise, far-sighted and definite co-ordination of all existing transportation agencies—land, water and air.

Better Adjustment for Brush-Holders Will Reduce Motor Trouble

MANY of the troubles experienced in railway motor operation can be traced directly to improper brush-holder action. The defects at the root of the trouble when located appear quite insignificant, but when remedied, a marked improvement in the operation of the motor results.

A surprising fact brought out in the brush-holder survey, results of which are given in this issue, is the large number of types of brush-holders, many of which are unsatisfactory and should be eliminated. Railways with several kinds in service should try to standardize so as to reduce the number on a single property to a minimum. Manufacturers have developed new brush-holders for some of the old type motors in which many of the modern improvements have been incorporated. Use of these improved designs will help minimize brush-holder troubles and insure prompt delivery of renewal parts.

Railway motor maintenance costs are reduced by keeping brush-holders in good condition. Careful attention to some of the points brought out in the brush-holder survey will lengthen the life of brush-holders, carbons and commutators, improve commutation and reduce the tendency to flash between brush-holders and ground. The importance of proper spring pressures has been discussed in these columns at frequent intervals. The survey shows that in general a spring pressure of about 5 lb. per square inch of contact area is good practice. If the brushes spark badly and there is a tendency to flash at high speeds, the spring tension can be raised to between 7 and 9 lb.

Breakage of springs and loss of tension in springs were among the most frequent troubles reported. By keeping braided shunts in good condition, excessive motor current does not go through the spring mechanism and some of the troubles are avoided. When carbon dust or dirt gets into the working parts of a brush-holder, it is sure to work stiffly. Cleanliness and occasional lubrication will do much to insure satisfactory operation.

Spacing of brush-holders and alignment parallel to the commutator bars should be checked at each inspection. In most types of railway motors brush-holders are aligned with the center line of the pole faces. The distance from the center line of one brush-holder to the center line of the next should be equal to one-quarter of the distance around the face of the commutator. The report from one railway stated that flashing with one type of its motors became so serious that cars could hardly be kept in service for any extended period. Investigation showed that the supporting faces had become so worn that when the brush-holders were installed they were not located correctly in relation to the field coils. Each motor was overhauled and the brush-holders were reinstalled with jigs and fixtures so as to make certain that they were located properly. This remedied the trouble.

The distance of brush-holders from the commutator surface affects the wear of the brushes. In general the under side of the carbon box should be between $\frac{1}{8}$ in. and $\frac{3}{16}$ in. from the face of the commutator. This is important, as it reduces the chattering and the tendency of carbons to break.

When mounting brush-holders in the motor frame, the pads or seats should be cleaned carefully and all dirt removed in order to insure proper spacing and alignment. In making connections from the wiring around the frame to the brush-holders, the cable leads should have sleeves or terminals, depending on the design of brush-holder. Use of proper connectors is important to keep the connections tight and secure good electrical as well as mechanical contact. Set screws, if used, should be equipped with lock washers and nuts to prevent loosening. When porcelains are used, they should be kept clean and free from dust and dirt so as to provide the necessary creepage distance to ground, otherwise flashing will occur and the burning action will lead to other troubles.

Manufacturers View New Year Favorably

REPORTS on the extent of business done by manufacturers during 1927 differ. Some of those in the local transportation field whose opinions were quoted in the last issue of this paper found sales somewhat slow. They found that the exchange of obsolete for modern equipment anticipated at the beginning of last year was not up to expectations. According to one prominent manufacturer, in some instances local conditions such as pending franchise changes, paving regulations, etc., beyond the control of the railways, undoubtedly accounted for this delay. Others found the year that has just passed satisfactory from a business point of view and several report an increase in sales over 1926 or previous years.

It is notable that the majority of the manufacturers look forward to 1928 with confidence and optimism. Some of them even believe that it will be a record year in the purchase of the kind of equipment they make. A composite expression of their opinions might read that public authorities are realizing more than ever before the need for good transportation and the railway companies themselves know that this can best be given with modern equipment. Hence they believe these coming twelve months will witness a long step in advance in the adoption and use of up-to-date apparatus.

In the main a crystallization of these opinions indicates that the industry's manufacturers may be expected to share in the continued prosperity of the country for 1928 forecast by leaders in other industries.

Brush-Holder Troubles

And How They Are Overcome

Common practices in brush-holder and carbon brush maintenance are determined from a survey covering 30 properties. Replaceable carbon brush boxes prove economical. Side wear of brushes greater with ventilated motors

MANY factors enter into the efficient maintenance of brush-holders for railway motors. The copper shunts break or burn off, insulators crack or become short circuited, flashing and grounding are most common. Many troubles are caused by conditions apart from the brush-holders themselves, such as the type and quality of carbon brushes used, amount of spring tension, or condition of commutator. To determine some of the problems that come up in connection with brush-holder maintenance and to find out how they are being solved most effectively, a survey of this particular phase of maintenance on 30 electric railway properties was made by this paper.

The results obtained by different practices or methods used to overcome some of the troubles are enlightening. The large variety of brush-holders in service is astounding. One property operating 137 cars has 23 different types of brush-holders in use, an average of but one type for every six cars operated. On this particular property none of the different brush-holder types can be used in more than one type of motor. Numerous other properties have many types of brush-holders in comparison with the cars operated. One railway with 49 cars had six different types; another operating 103 cars had eight. Others were one company with 166 cars had thirteen types, a second with 227 cars had seven different types, another with 664 cars had nineteen different types. Still another with 407 cars had twelve different types and another with 403 cars had eleven different types. Out of a total of 26 replies in which definite information was given, the number of car equipments per brush-holder varied from 6 to 344. Under the best conditions, one property operating 3,441 cars had ten different types of brush-holders, a second with 2,000 cars had six different types and a third with 2,858 cars had nine different types. The minimum number of types found was on three properties operating 209, 149 and 91 cars respectively. Each has but two different kinds of brush-holders. The average for the 26 railways from which the information was obtained showed 92 cars per brush-holder type. Of these railways seventeen stated that none of the types could be used in more than one type of motor and nine have types which can be used in two different types of motors. Thus it appears that here is a wide field for standardization.

Of the large variety of brush-holder troubles, those mentioned most frequently are broken springs, worn carbon boxes, broken shunts, flashing and weak springs. Other troubles include grounded, short-circuited, loose and broken insulators, loose shunts, burned and loose springs, broken pressure arms, broken fronts, worn contact tips and dirt back of tension springs.

Rigid Inspection Essential

Many of the methods cited for overcoming brush-holder troubles can be classed under the general heading of rigid inspection and maintenance. Some of the methods given in replies to a question as to how brush-holder troubles are reduced are as follows: Keeping insulators clean; baking and cementing the insulators in place; careful attention to keeping commutators properly slotted; keeping brush-holders, commutators and fields in good condition; use of a clock-spring type of brush-holder; replacing and adjusting springs at frequent intervals; use of a combination of spring and finger type of brush-holder; improvement in the type of shunt and connectors used; giving more attention to the removal of worn brushes; use of a new flat coil-type of spring instead of old-style wire springs; shaping the carbon box on a steel mandrel; checking carbon boxes with a limit gage; cutting out the bottom of brush-holders so as to let out dirt; use of renewable carbon ways; replacing armature bearings; frequent checking of brush-holder spacing; keeping brush movement to a minimum; repairing bad track; insulating motor cases; reducing the voltage on old-type motors; testing fields at frequent intervals for short circuits, and stopping the practice of operating down grade with power on.

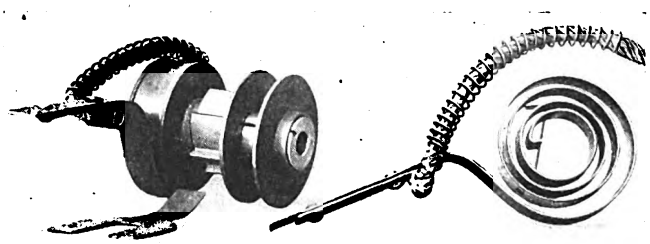

Fig. 9—Six-tooth single center-ratchet type adjusting mechanism for Westinghouse No. 306 railway motor brush-holder

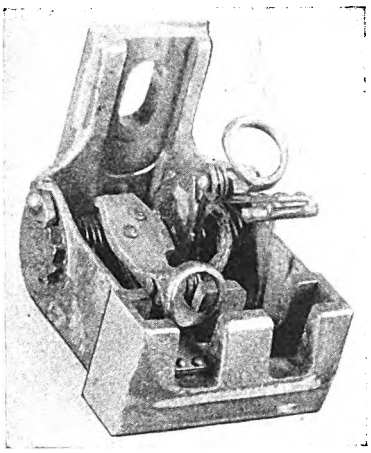
Many of these practices are common and are included in the general inspection and overhauling of brush-holders of different railways. However, it is evident that more careful attention should be given to these troubles and inspectors should be instructed in the various points to be taken care of to make certain that brush-holder troubles will not occur. Satisfactory operation cannot be expected where the carbon brushes themselves are loose in the brush-holders due to worn conditions or where

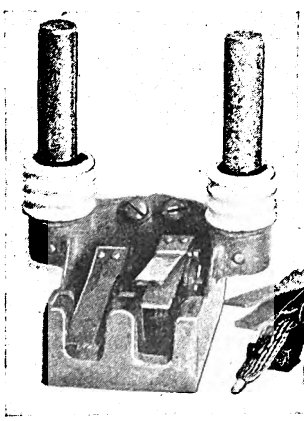
Digitized by Google

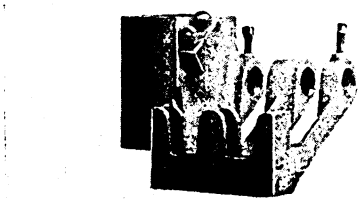
pressure on the brushes cannot be maintained uniform because the springs need repairs. Careful attention to this particular part of the equipment will bring gratifying results.

Spring Tension Should Not Be Adjusted by Carhouse Men

Railway maintenance men at present seem to be agreed that it is advisable to provide modern brush-holders with some means of adjusting the spring tension. Further, they seem to agree that it is not objectionable—in fact, it is preferable—to remove the brush-holder from the motor in order to make this adjustment. Brush-holders so designed cannot be adjusted readily by carhouse men so that they will not tamper with the spring tension. Adjustments are then made in the shop by trained workmen with proper tools and the most satisfactory operating spring tension maintained. The adjustment is made under the supervision of some responsible head in the shop.







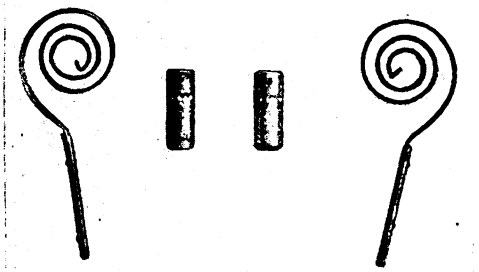


Fig. 10 (Top, left)—The brush-holder of the G.E. No. 21 motor has a ten-tooth ratchet wheel for adjustment.

Fig. 11 (Bottom view)—Fifteen-tooth ratchet-wheel type adjusting mechanism for Westinghouse No. 306 railway motor brush-holder

Fig. 12 (Top, right)—Barrel and set screw ("Flower") type of brush-holder with ten adjusting notches.

Some of the earlier types of brush-holders, many of which are still in use, have tension springs designed for a fixed pressure without adjustment. Later designs include some means of changing the spring pressure on the pressure finger by winding or unwinding the coiled spring and locking it in position.

Accompanying illustrations show some of the various types of brush-holders. Figs. 1 and 2 are of a non-adjustable type, in which a round steel wire helical spring gives a definite pressure. To change the pressure a new spring with a different number of turns or a different size of wire must be used.

In the brush-holder illustrated in Fig. 3 a flat bronze spiral spring gives a partial adjustment. To change this within small limits, the spiral spring may be opened or closed by straining its turns while in position. This will, respectively, increase or decrease the pressure by a limited amount. The Lindall type of brush-holder, shown in Fig. 4, also comes under this class. This uses a Z-shaped flat bronze spring.

A square spindle-type brush-holder is shown in Fig. 5. In this a flat bronze spiral spring is anchored at one end on a square spindle forced into the brush-holder casting. The other end is hooked over an arm on the brush-holder harness or finger. To change this adjustment the spring with the harness is slipped off the square spindle and turned a quarter of a revolution and then replaced on the spindle. This arrangement gives four adjusting points in a revolution. A similar type, but having a hexagonal spindle, is shown in Fig. 6. The method of adjustment is similar but there are six adjusting points in a revolution.

A worm wheel type in which the adjustment means consists essentially of a flat bronze spiral spring anchored on a sleeve on which is cut a spiral thread to engage a worm cut on the adjusting rod, is shown in Fig. 7. This adjustment is made by turning the adjusting rod with a screwdriver, giving an infinite number of steps for the spring tension. A ratchet wheel type with six teeth is shown in Fig. 8. This has a flat bronze spiral spring, one end being secured on a six-toothed ratchet wheel. The ratchet and spring are assembled in a metal harness or finger on which is fastened a pawl or dog which engages the teeth of the ratchet. The other end of the spring is held in an anchor clip riveted to the brush-holder casting. Adjustments are made by shifting the ratchet from one tooth to another. This arrangement gives six adjusting points in a revolution. Fig. 9 shows a somewhat similar scheme of adjustment except that steel spiral springs are used and both springs are anchored to a brass sleeve which has a single set of six teeth on the ratchet located at its center. This makes a common adjustment for both springs and gives six adjusting points in a revolution.

A ratchet wheel type adjustment with ten teeth is shown in Fig. 10. This uses a somewhat similar scheme of adjusting as that in Fig. 6 except that the design of the spring is different. It is a round steel wire helix and the method of anchoring is also different. This arrangement gives ten adjusting points in a revolution. A ratchet wheel type with fifteen teeth is shown in Fig. 11. This is similar to the six-tooth ratchet wheel type and is adjusted the same way except that to compensate for the use of a flat steel spiral spring with fewer turns, a fifteen-tooth ratchet wheel is used. There are fifteen adjusting points in a revolution.

A type of brush-holder with a flat bronze spiral spring anchored on a sleeve or barrel is shown in Fig. 12. This has ten adjusting notches equally spaced in the same plane around its circumference. These notches are engaged by points of set screws, located in the brush-holder casting. Ten adjustments in a revolution are made by turning the spindle from one notch to the other. A

Digitized by Google

spindle and cotter pin type of brush-holder, shown in Fig. 13, has a flat steel spiral spring which is anchored in a slot on the spindle. The spindle has four adjusting holes spaced 90 deg. apart in the same plane around its circumference. A boss on the casting has three holes spaced 60 deg. apart through which a cotter pin engages the holes in the spindle. This arrangement gives twelve adjusting points in a revolution by shifting the cotter pin and at the same time engaging a different hole in the spindle. Fig. 14 shows a similar arrangement with two sets of adjusting holes in the spindle, staggered 45 deg., and two sets of holes in the brush-holder casting. This combination gives 24 adjusting points in a revolution by shifting the cotter pin.

Barrel and cotter-pin types of brush-holders are shown in Figs. 15 and 16. In these a flat steel spiral spring is anchored in a slot on the barrel which has ten adjusting holes equally spaced in the same plane around its circumference. This barrel is anchored to the spindle by means of a cotter pin. The spindle is kept from turning by means of the cotter pin anchoring it to the brush-holder casting. This arrangement gives ten adjusting points in a revolution.

A pneumatic type of brush-holder is being developed in which there are no springs, the pressure being supplied by compressed air. An air-operated plunger resting on top of the carbon replaces the ordinary spring. An infinite number of variations of pressure on the brush-holder are possible, being regulated by the air pressure.

Brushes Should Fit Snugly

It is generally conceded that to prevent breakage of their side walls, carbon brushes should fit the box as snugly as possible without binding. To check this, information was obtained as to methods in use for determining wear inside the brush-holder boxes and for making repairs to worn surfaces. It is universal practice to check the wear on the insides of the carbon boxes. Information was received from 25 railways regarding this, 24 stating that they do check the wear and one stating it does not. Regarding the amount of wear permitted before brush-holders are removed, seven reported a maximum wear of $\frac{1}{32}$ in., seven others allowed $\frac{1}{16}$ in. wear before replacement and two allowed $\frac{1}{8}$ in. wear. Of the others the minimum amount allowed was 0.01 in. and the maximum $\frac{1}{4}$ in. Manufacturers recommend that the maximum wear should not exceed $\frac{1}{32}$ in. In regard to repairs made to worn carbon boxes, fourteen railways make repairs and eleven stated that no repairs are made. Of those that made repairs, six used the method of closing the carbon box onto a steel sizer; six others fill in worn portions by welding and then broach or remachine. Two additional companies have a practice of putting on a new front, and the method used on one railway is to saw the box apart and then weld it together to the original dimensions.

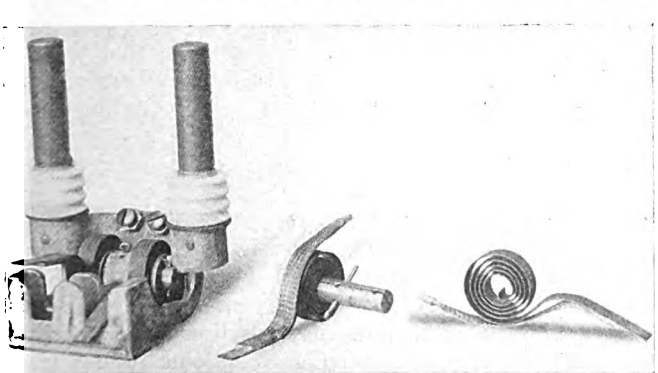

Fig. 13—A spindle and cotter-pin type of brush-holder is used on the Westinghouse No. 306 motor

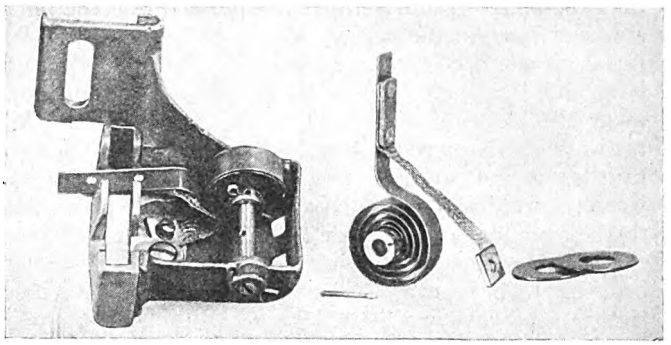

Fig. 14—Spindle and duo-cotter-pin type adjusting mechanism used with Westinghouse No. 508 railway motor brush-holder

In connection with the fitting of the carbons in the brush-holders, some information was obtained as to carbon-brush practice. Undercutting of the mica on railway motor commutators is now universal. This has permitted the use of a higher grade of carbon which has less grinding action. The recommended practice is for the use of a graphitized carbon brush. Generally a spring pressure of about 5 lb. per square inch of contact area is considered good practice. This gives a range of pressure on the carbons of from 5 to 7 lb., depending on their size. Information obtained showed a variation in spring pressure on carbons of from $2\frac{1}{2}$ lb. to 10 lb., the average, however, being 5 lb. per square inch. Where track is poor, resulting vibration necessitates increased spring tension in order to reduce sparking and the tendency for the motor to flash at high speeds. On some railways, marked improvement was obtained through raising the brush pressure to 7 and 9 lb. Under these conditions of increased pressure it was expected that the end wear of carbons would be quite rapid, but this was less with the high pressure than with the low under similar conditions of rough track. This was explained by the fact that with the increased pressure there is less burning at the commutator surface, and apparently the burning action wears away the brush more rapidly than mechanical friction from the increased pressure.

From the information obtained it was found that from 0 to 95 per cent of the brushes were replaced for side wear, the majority stating that on the average about 25 per cent are replaced for this reason. An attempt was also made to determine if the length of brush used had any effect upon the resulting side wear, the thought being that long brushes cause a greater side pressure due to the action of the contact tip. The greatest number of replies indicated a length of brush of from 2 in. to 3 in. The shortest length which a brush was reported as being worn before replacement was necessary was $\frac{1}{2}$ in. and the longest $2\frac{1}{4}$ in.

Causes of side wear appear to be in most cases dust and dirt and worn carbon boxes. Some other causes mentioned were irregularities in carbon box face, rough commutators, vibration, broken shunts, weak tension, lost motion in bearings, spring contact out of line with brush, worn pins in brush-holders and one-way operation of cars. The proportion of brushes which it is necessary to replace for breakage is negligible, according to the majority of the replies. In one reply, however, this was given as 20 per cent. In regard to the fit of the brushes when both brush-holders and carbons are new, ten railways reported that they specify a brush $\frac{1}{64}$ in. smaller

Digitized by Google

than the box. Manufacturers recommend that the initial side clearance in the carbon box be from 0.006 to 0.008 in. If it is much less, the carbon will tend to stick in the box, and if greater it will rattle in the box and wear away the sides. There is also a tendency to chip and break with large clearance. The width variation of brushes is not so important. In some cases, brushes were reported with as much as $\frac{1}{16}$ in. smaller width than the box without causing any trouble in service.

Eighteen railways gave the life obtained from carbon brushes. The average maximum brush life for these eighteen railways was 40,905 miles and the average minimum was 16,748 miles. It thus appears that 20,000 miles

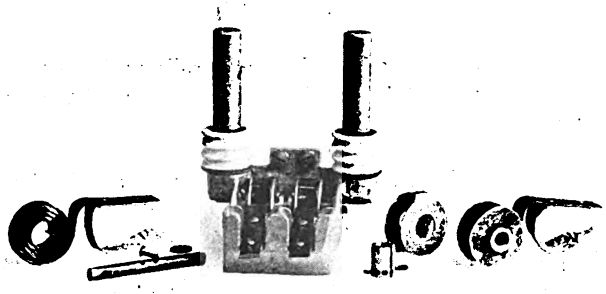

Fig. 15—Barrel and cotter-pin type adjusting mechanism for Westinghouse No. 319-B railway motor brush-holder

is a good average to be expected. Shortly after the ventilated railway motor was introduced, investigation of this point showed that most railways have experienced greater wear with the ventilated motor. Further investigation and studies made from the data available shows that this increased side wear in ventilated motors is due largely to the abrasive action of the dust and dirt drawn through the motor by the ventilating fan on the armature. On thirteen properties included in the present survey both ventilated and non-ventilated types of motors were used, so that a comparison of the performance in the same service was obtained.

The information on brush mileage included replies from fifteen properties that have both interpole and non-interpole motors in use. Some of the means suggested for reducing side wear of carbons in ventilated motors are given. It is advisable to select carbons carefully in order to secure brushes best suited to operating conditions. Some operators have done this by making tests of the various grades. Shunts to the carbons in some cases have seemed advantageous. Instances have been given where the use of one wide carbon instead of two narrow ones in the same brush-holder has reduced side wear. There is some disadvantage to this, as two separate carbons are less likely to cause flashing at the commutator.

Relative Wear of Brush-Holder Parts

An effort was made to accumulate data on the average life of various brush-holder parts such as castings, springs, shunts and spindles. Very complete information from twelve different railways showed an average life of 8.3 years for brush-holder castings, 4.4 years for springs, 3.5 years for shunts, and 4.2 years for spindles.

Shunts on carbon brushes have almost entirely disappeared. Of the entire 25 railways included but three still used them. Shunts on brushes have been replaced by a shunt on the brush-holder, which connects the contact tip on the finger with the main casting. This shunt must be large enough to carry the current and make a good electrical contact. It may be brazed, soldered or riveted. A good electrical path for the current prevents much of the side wear of the carbon and the burning of the carbon box. Therefore, it is very important to keep the shunts in good condition.

Only two railways out of 25 reported extensive breakage of shunts; the others have practically no trouble. Pressure springs are a larger source of trouble, seventeen of the 25 railways having some trouble from pressure springs losing their tension. Increased life and less loss of spring tension have resulted from use of a good quality of material, through checking tension at frequent intervals, and on some properties by changing from a bronze to a steel spring. Other practices that have increased the life of pressure springs are keeping commutators true, eliminating excessive wear in bearings, loosening spindles when they are too tight, and changing from the spiral spring type to the clock spring type.

In most types of railway motors the brush-holders should line up with the center line of the poles, and the distance from the center line of one brush-holder to the center line of the other should always be equal to one-quarter of the distance around the face of the commutator. The most common practice for checking alignment of brush-holders was that of lining the carbon box up with the commutator bars, thirteen railways using this method. Four others check alignment with jigs, and four check from the machined supporting surfaces. The ordinary method of checking spacing is by counting the commutator bars. Some railways use a special gage for their motors, and one railway uses a steel scale.

It is common practice to keep the underside of the carbon box from $\frac{1}{8}$ in. to $\frac{1}{4}$ in. above the commutator surface so as to prevent breakage of carbons. This is done by loosening the clamping block and moving the brush-holder until the correct setting is obtained. A piece of fiber $\frac{1}{8}$ to $\frac{1}{4}$ in. thick makes a handy gage. The nut which holds the clamping block should be tightened

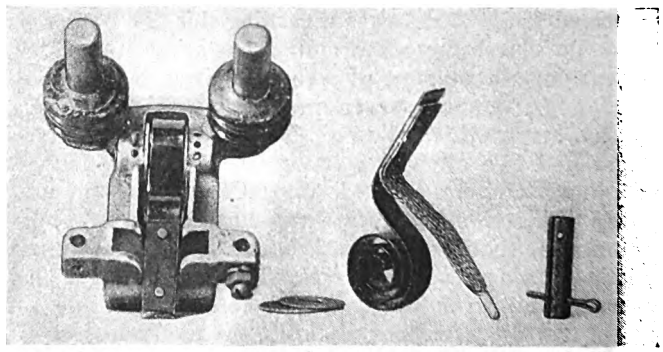

Fig. 16—Ten adjusting points are provided in this G.E. No. 80 barrel and cotter-pin type brush-holder

carefully so that the brush-holder will not come loose. From the information obtained, it appears that an average of $\frac{3}{16}$ in. is most used, although some railways specify $\frac{1}{8}$ in. Carbon dust and dirt are usually cleaned from brush-holders and insulators by wiping and by compressed air. Four railways use gasoline for cleaning and one uses a wire brush.

Out of 25 replies giving the extent to which brush-holders with replaceable carbon brush boxes are used, eighteen had some type of renewable box in service. In regard to advantages, the most general reply was that they were installed as a means toward economy, and that they are proving very satisfactory. Nine replies stated that the new type brush-holders had not been in service a sufficient time to determine advantages or disadvantages.

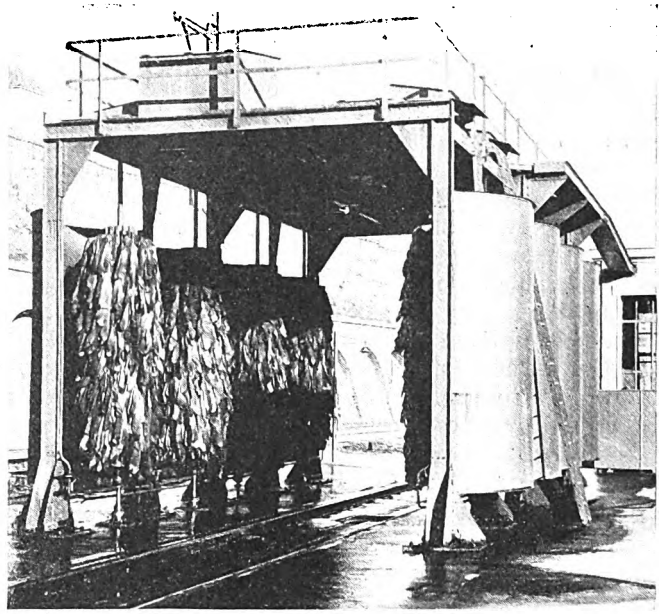
Machines Scrub *as Well as* Wash Cars

Novel devices differing somewhat from those developed in America have been perfected by European railways



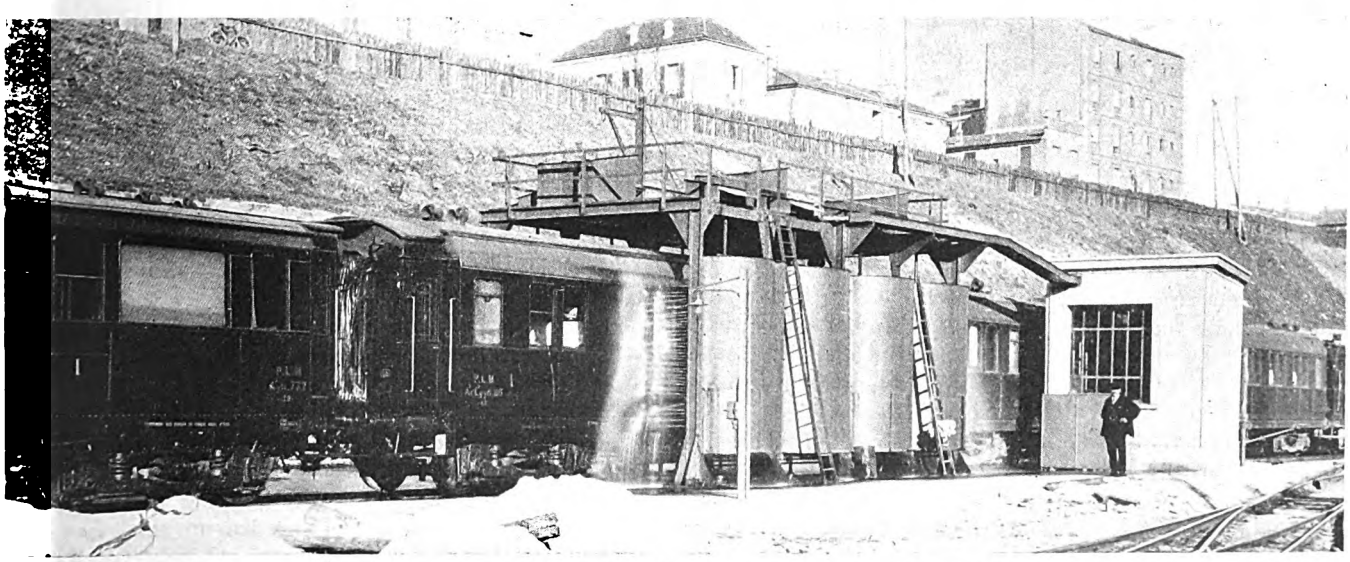
This view of the French washing machine shows the vertical shafts and wipers. Employees can reach the elevated platform above the machine for the repair of the machinery by means of an iron ladder

SEVERAL European car-washing machines have been described in this paper within the last few months. All have been based on the principle of directing sprays of water against the sides and ends of the car. This is the principle generally followed in car-washing machines used in the United States. Where this method is followed, it often is necessary to apply a scrubbing brush against the side of the car as well, so as to remove any spots of hard mud that resist the washing action of the spray.

With car-washing machines now in use on the Paris-Lyons-Mediterranean Railway, the Metropolitan Rapid Transit Railway of Paris, and the London Underground Electric Railway, manual scrubbing is not necessary except at the ends, as it is done by machine. The scrubbing is accomplished by long strip "wipers" attached to vertical revolving shafts driven by motors. As the shafts revolve, the strips, which are heavy with water, are thrown out horizontally by centrifugal force against the sides of the car. The car passes through four pairs of these wipers at the same time that it is sprayed from vertical pipes with perforations set at different angles so that the sides of the car are thoroughly washed down.

The accompanying illustrations show the washing equipment of the Paris-Lyons-Mediterranean Railway. There are four revolving shafts on each side of the track, each pair being driven by a 15-hp. motor. These shafts are driven at different rates of speed and in different directions. The first pair revolve at 49 r.p.m. and the ends of the wipers rub against the car in the direction opposite to that in which it moves through the machine. The second pair is driven at 46 r.p.m., the ends of the wipers touching the car moving in the direction in which the car is moved. The third pair moves in the same direction as the second pair, but at 59 r.p.m., and the fourth pair in the same direction as the first pair, but at 37 r.p.m. Water is sprayed both on the wipers and on the car body. The car passes through the washing machine at a rate of about $1\frac{3}{4}$ m.p.h.

Various types of material have been used for the wipers. Until very recently these wipers have been cut from the same cloth as used for the upholstery in the company's first-class and second-class compartments. This is a very high grade of textile upholstery goods, somewhat like mohair, and able to stand up well under



This washing machine is located at Bercy-Conflane just outside of Paris. It scrubs as well as washes the cars, which pass through at the rate of $1\frac{3}{4}$ m.p.h. Sometimes as many as 500 cars are washed each day by this machine, working 24 hours per day

Digitized by Google

the hard service to which it is put. When this material is used the wipers have to be replaced only about once a month.

Unfortunately for the department responsible for the washing of cars, the company has given up the use of this material in its upholstery, so no more of it is available. Instead the maintenance department is testing some other kinds of cloth for this service. Some are proving more satisfactory than others but none has as yet given as good results as the mohair previously mentioned.

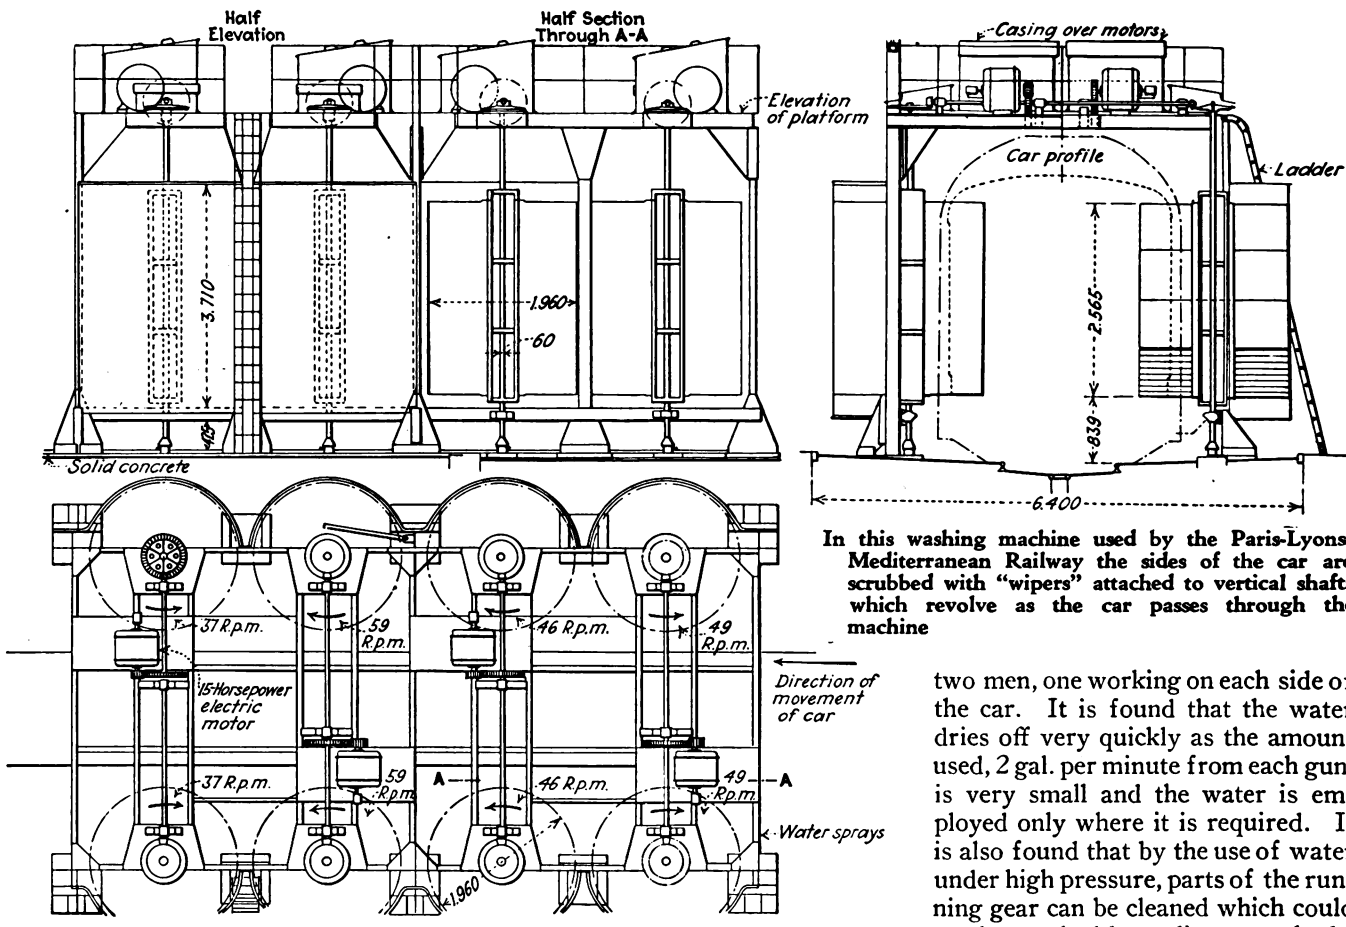
The washing machine of the London Underground Railways is installed at its Ealing Common depot and is very similar in construction. According to the London *Engineer,* the wipers on the four pairs of vertical shafts are soft leather, but other recent British periodicals speak of them as being of soft cloth. After leaving the revolving scrubbers and before emerging from the machine, the car passes through a further spray to complete the wash.

Each car goes through this machine every four to six days, in addition to the nightly cleaning that every underground car receives. The routine of the London cleaning machine may be summarized as follows: (1) The cars are passed through the machine every four to six days for the purpose of a wash down and for window cleaning. (2) The cars are periodically scoured to remove all dirt that may gradually adhere to the paintwork after which they are again passed through the machine.

The British technical papers also report that the Metropolitan Tramways Company of London has installed some so-called water spray guns for cleaning its cars. These guns are directed by hand and receive their supply of water from electric pumps which give a pressure of 300 lb. to the square inch. Hence, the water comes out of the gun with great force. It is conveyed from the main high-pressure supply to the guns by specially strengthened rubber hose which leads down from a roof pipe in the carhouse. The guns can be arranged to give either a fine spray or a powerful jet. The latter is used to clean dirt from the running gear under the car and the former for cleaning the windows and panels.

Besides the removal of dirt by the force of the water, some scrubbing of the sides and windows is done by hand at the same time that they are sprayed. A light brush, fitted on the end of an aluminum rod, 5 ft. long and attached to the spray gun, is used for this purpose. As this brush is so arranged that the jet sprays just below the brush, the two operations of spraying and scrubbing are reduced to one operation.

A double-deck car is washed in about two minutes by two men, one working on each side of the car. It is found that the water dries off very quickly as the amount used, 2 gal. per minute from each gun, is very small and the water is employed only where it is required. It is also found that by the use of water under high pressure, parts of the running gear can be cleaned which could not be reached by ordinary methods.



In this washing machine used by the Paris-Lyons-Mediterranean Railway the sides of the car are scrubbed with "wipers" attached to vertical shafts which revolve as the car passes through the machine

The JOURNAL is indebted to the Department of Commerce, Washington, for particulars of the French machine described, with samples of the wipers used.

New Records for Chicago Elevated

ONLY three or four years ago it was considered exceptional operation when as many as 900 cars entered the Loop over the lines of the Chicago Rapid Transit Company in an hour. Through the use of extended station platforms and longer trains, together with a rearrangement of train stopping points at Loop stations, operation has been speeded up until 1,000 cars an hour is now the daily average entering the Loop in the morning rush. A high record was set on the morning of May 27, when a total of 188 trains of 1,032 cars entered the Loop in the hour between 7:50 and 8:50 a.m.

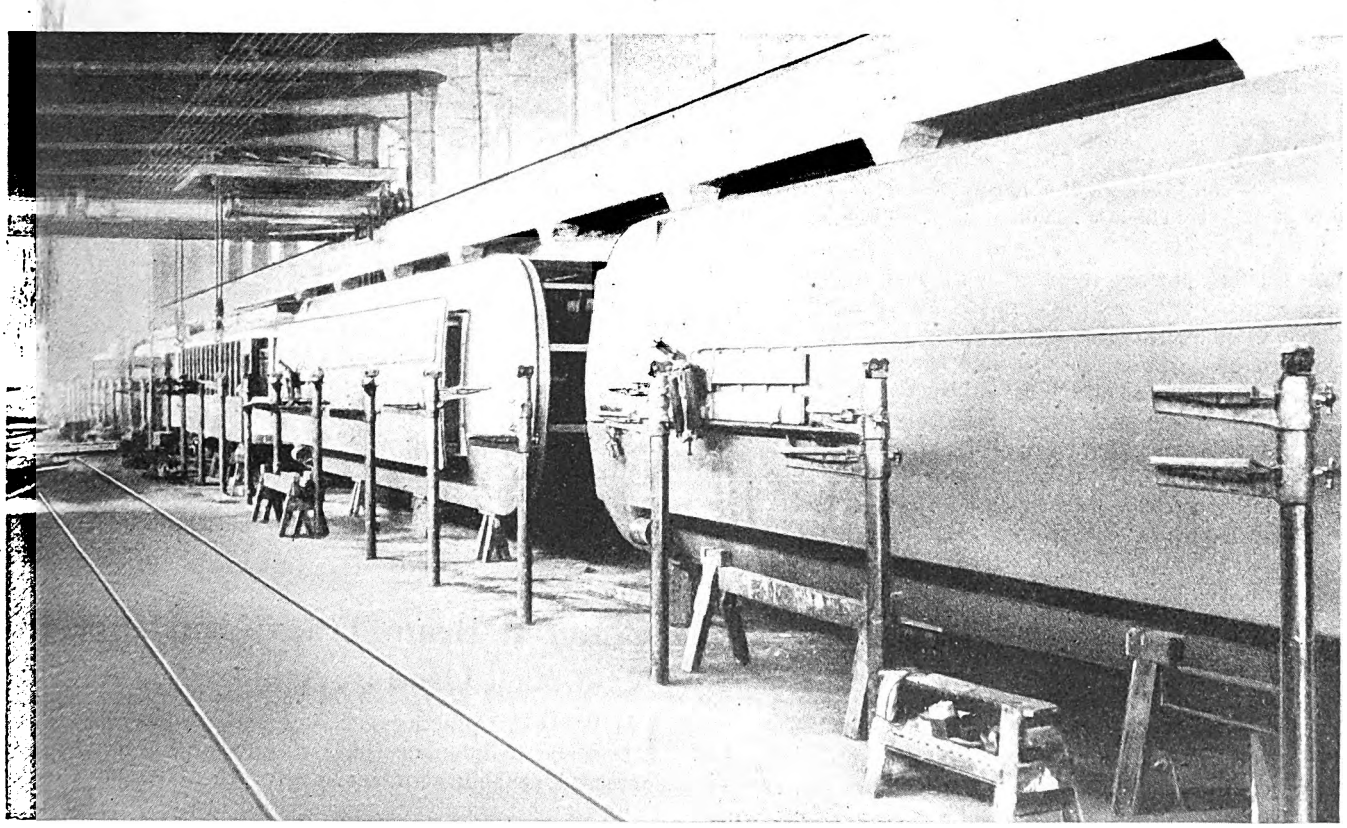
Turning Cars on Their Sides

Facilitates General Repairs

By means of cradles and specially fitted cranes entire car bodies are turned over readily in the Twin City shop. Work on the under side is made much easier



A row of cars in the Twin City shop. The two in the foreground are undergoing repair while they are turned over, while those in the rear have been turned back to the upright position for completion of the overhauling

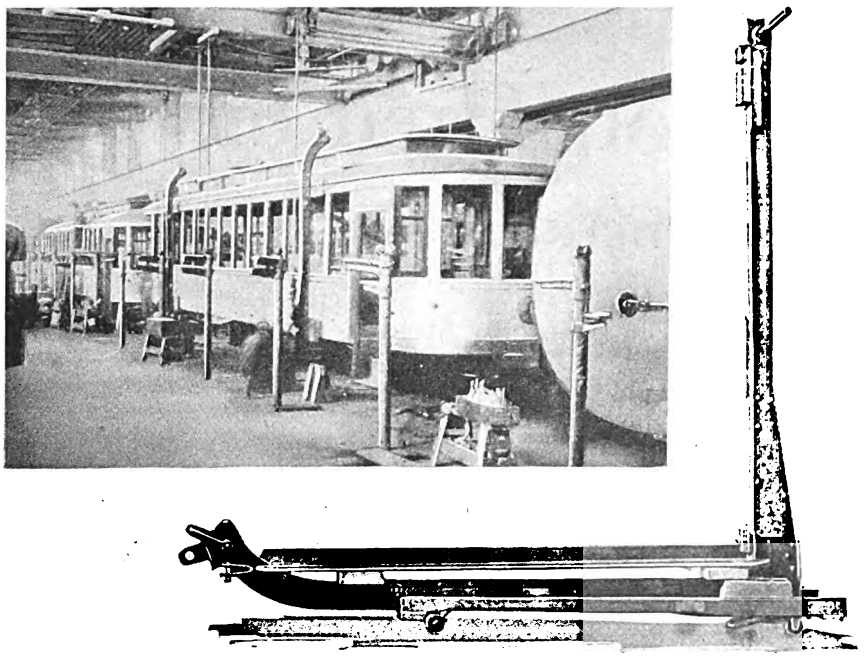
CAR repair work has been facilitated in the St. Paul, Minn., shop of the Twin City Rapid Transit Company through the adoption of a plan of turning car bodies edgewise for general overhauling. The plan, which was devised by W. J. Smith, master mechanic, has made possible more effective inspection to detect rotted and corroded parts and has made the substitution of new parts comparatively easier.

When a car arrives at the shop for general overhauling it is first placed on an outdoor receiving track for stripping. Here the readily removable parts, such as doors and window sash, seat cushions and miscellaneous fittings are taken out and sent to the proper departments for inspection and repair. Either the trucks are removed and temporary trucks are substituted or the truck connections are loosened so that the permanent trucks can be removed readily. The car is then run on the transfer table and sent into the main repair bay, being spotted on one of the two tracks set aside for the purpose of general overhaul.

Two cradles are then placed around the car body. An accompanying illustration shows one of these cradles. In the picture it is resting on a wooden truck which has been designed for holding it so that it can be moved about the shop readily when it is not in position for holding a car in the process of turning. It will be seen that the cradle has two main members at right angles. These are steel forgings shaped roughly to fit the contour of the car. They are permanently joined together at right angles, so that when the bottom member is beneath the body sills the upright member will rest along the side of the car. A removable member serves as a diagonal brace, passing through the windows and connecting with the upright member at a point near the top of the window opening. On the opposite side it is fastened to the end of the horizontal member. A fourth member of the cradle, which is a round steel rod, is placed on the opposite side from the permanent frame. This rod is free to rotate as the car is turned.

When the cradles are placed in position about the body

Digitized by Google



Two of these cradles support the car while it is in process of turning. The insert shows a car which is swinging on the cranes

they are held firmly in place with blocks so that there is no chance of the body shifting as it is turned. With the cradle in place, hooks from the carriages of the overhead traveling crane are attached to the cradle, one set at the bottom next to the sills and the other set at the top of the side frame adjacent to the roof and to the round rod. The body is lifted clear of the trucks, which are run out so that the body is free to move. The differential gear on the crane is then brought into play. This gear consists of a pair of drums with one set of cables reversed so that as one lifts the other lowers an equal amount. The body, swinging free, is then literally rolled over on its side by means of the differential gear. When it has been turned through an angle of 90 deg. horses are placed underneath and the body is lowered onto them. The cradles are then removed and the body is ready for inspection and repair work.

The process of righting the cars is similar to that described for turning them over, the motions merely being reversed. One of the illustrations shows a car which has just been righted and which still is swinging on the crane. The workmen are preparing to put blocking underneath the sills so that the body may be lowered from the crane and the cradle removed.

One of the views shows a row of cars in one of the bays. Those in the foreground have been turned over and work is being done on them. The ones in the rear have already been through the processes that are carried out on the side and have been righted once more, after which the work of reinstalling the parts which were removed takes place.

Advantages of Turning Cars Over

A number of advantages result from the use of the new process. The principal one is that it is possible for the workmen to get at parts of the car which ordinarily are inaccessible, such as the underframing and the equipment beneath the floor. Inspection of the framing is an easy matter when the car is turned over, and many defects have been discovered which never would be noticed if the inspector had to get into a pit and look upward, depending on a portable lamp for light. Rotted timbers and rusted hangers, air tanks and other metal parts have been discovered. Naturally it is easier to attach or remove equipment which is fastened beneath the car, and wiring can be done with comparative ease.

Another advantage which is seen is that it is possible to paint the under side of the car, getting a good penetration of a protective paint, which was not possible with the old methods. It is felt that this protective painting will result in a much longer life of the framing, the floor and the equipment mounted under the car.

While one gang is working on the equipment beneath the car, another force is able to work inside. This is made possible by laying planks along the side, which now is in the lowest position. Painters can clean and varnish the headlining so as to obtain a better finish in less time and with less fatigue than when the work is done overhead. At the same time attention is given to the roof. While this can be done in the ordinary repair process, it is felt that the workmen are able to do a better job while standing erect and facing the roof than when they must crawl over it, having a relatively insecure footing and being forced to work out toward the edge. This is particularly true with the monitor roof cars used in the Twin Cities.

Mr. Smith estimates that the new method has made a material saving in the cost of doing the work, in addition to the better class of workmanship that is attained.

Concrete Beam Track Construction Used in Atlanta

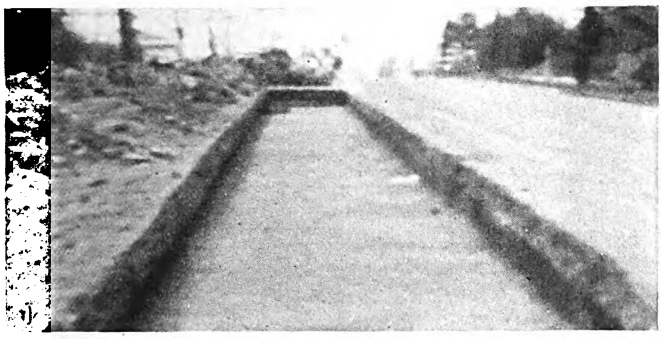
IMPROVED practices of track and roadway construction and maintenance have resulted in lower cost and increased reliability of service for the Georgia Power Company, Atlanta, Ga., as described in the brief of that company submitted in the competition for the 1927 Charles A. Coffin Award. There was a reduction in total derailments and split switches from 270 in 1923 to 129 in 1926.

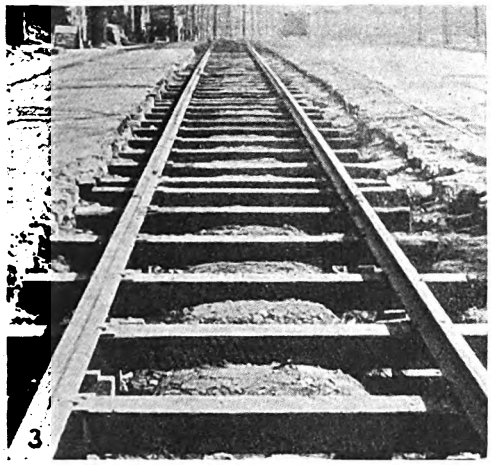
An original type of concrete beam track has been developed. Benefits of using creosoted ties and timbers have been demonstrated and a system for the handling of sand has been inaugurated in which air pressure is substituted for manual labor.

With the concrete beam track a saving of 40 per cent of the concrete and 43 per cent of the rail cost has resulted. The ties and the base of the rails are supported by concrete. The saving in the rail cost is because with the continuous support a light 80-lb. A.S.C.E. section can be used.

After excavating to the subgrade of the paving, the ground is tamped thoroughly or rolled if necessary. After excavation for the beams, the rails and ties are laid. The rails are then bolted together temporarily and spiked with the company's combination tie plates on every tie. The joints are next thermit welded, the track is brought to grade on creosoted pine blocks and the exact

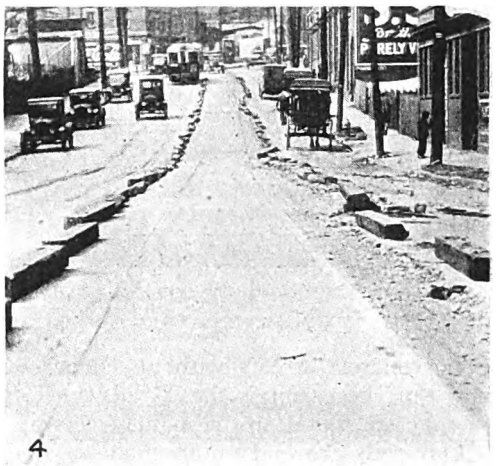
Digitized by Google





Four stages of concrete beam track construction

1. Trench excavated and rolled.
2. Earth mounds excavated.
3. Ties and rails ready for pouring concrete.
4. Finished construction.



final line and surface are adjusted by the use of oak wedges. Immediately following this the concrete structure and the paving are poured if concrete is to be used. The concrete is tamped thoroughly beneath the ties and rails. This method leaves the concrete in beams around the rails and ties, with mounds of earth in between.

This type of construction costs 15 per cent less than 7-in., 122-lb. rail on stone ballast, 29 per cent less than 7-in., 122-lb. rail on concrete beams of similar construction and 20 per cent less than 80-lb. A.S.C.E. rail on ties spaced 2 ft. apart and concrete laid without mounds between the ties.

Concrete Foundations Completed in 24 Hours

A process of laying concrete track and paving foundation under traffic has been developed by use of which jobs can be completed in 24 hours or less. The process consists of double tamping clean crushed stone 5 in. beneath the ties, after which new crushed stone is added to bring the foundation to the required height for the paving base. This is rammed thoroughly. The stone is then filled to its surface with 1 to 1½ grout to which 3 lb. of calcium chloride per sack of cement is added. The paving surface is laid immediately and traffic turned on it as soon as it is ready.

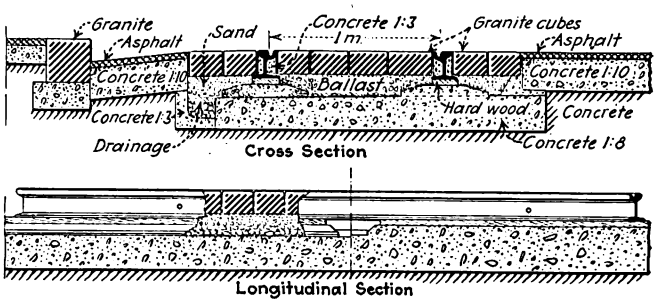
Improved use of electric welding in track construction has resulted in lower cost and increased efficiency. Worn flangeways in crossings have been filled in successfully with electric welding and ground to correct depth to make them flange bearing. The building up of the heels of switch tongues with electric welding is being done with excellent results. This treatment has been found superior to the common practice of using thin shims at the heels of switches. These and other uses of electric welding will prolong the life of the frogs, crossings and switches, with resultant saving in maintenance cost. Electric seam welding of joints is also done successfully.

Jugoslavia and American Track Differ in Many Respects

By Milan Manojlovitch

Chief Consulting Engineer Subotica Electric Railway & Light Company, Subotica, Jugoslavia

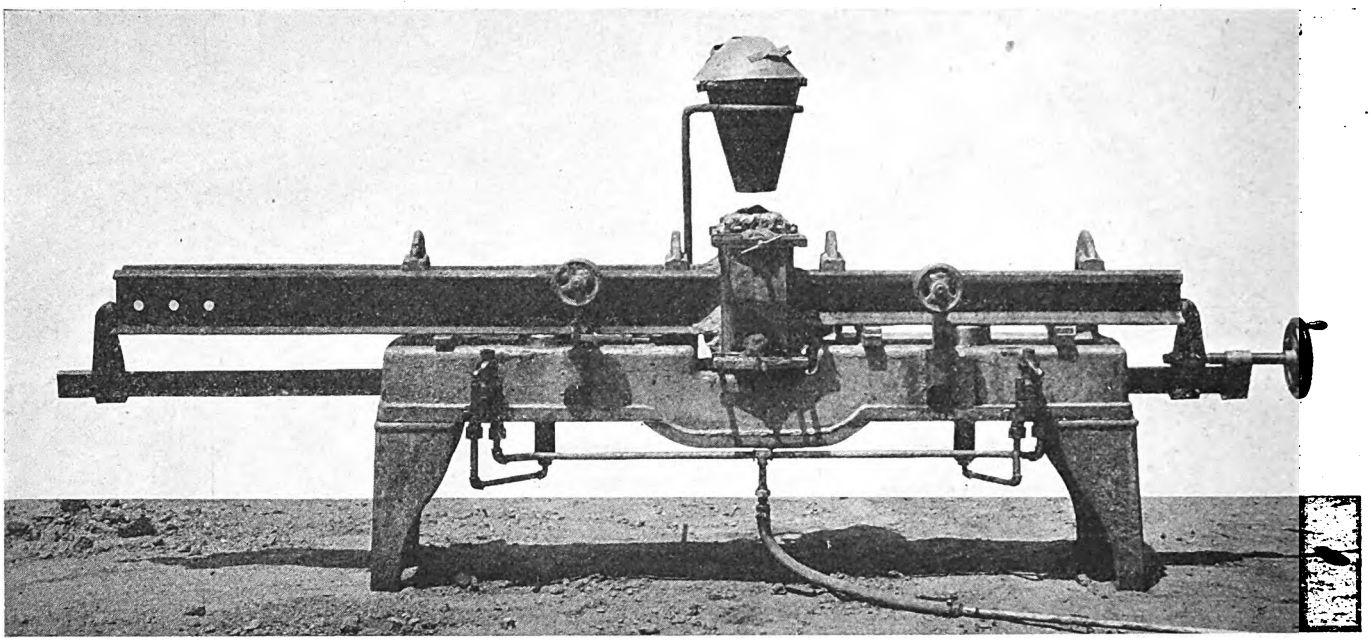
WIDELY divergent methods are used in the construction of track systems in America and Central Europe. In America street car rails are laid directly in concrete on some properties, utilizing ordinary T-rails. In Jugoslavia and Central Europe, in general, the use of concrete and asphalt in direct connection with rails is avoided as much as possible. It is the practice to place paving blocks of stone, ceramic material or wood in two or three rows on either side of the rail. By this



Cross and longitudinal sections of Jugoslavia track showing parallel under-construction and use of gravel ballast

method the breaking and crushing of concrete and asphalt which result from the elastic movement and the continual vibration of the rails under traffic conditions are avoided. This method is also employed wherever the rails themselves are placed on solid concrete foundations. It is only with this method that we have been able to prevent the deterioration of the concrete and asphalt. How-

Digitized by Google



The two rails are held firmly by pneumatic clamps while being welded

ever, concrete streets without asphalt overcovering are not usual here, nor is the T-rail, track construction laid in concrete found on the main streets of our cities.

Our rails are laid on foundations immediately under and running parallel to the rail itself, whereas in America cross-ties are used. We use cross-ties only with track construction on stone ballast without concrete, on open stretches outside of the city limits. The rails are joined at frequent intervals by spacing bars, which serve also as the electric connection, but these do not replace the cross-ties above mentioned.

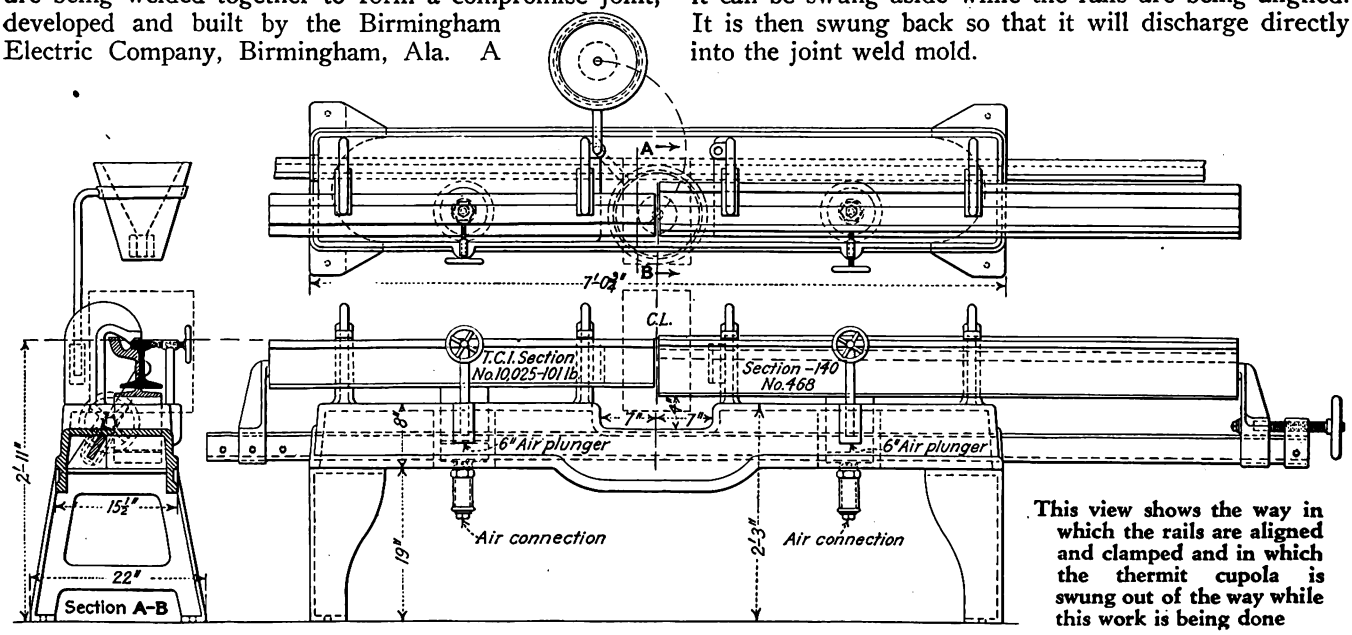
In paved city streets grooved rails with the border of paving blocks as above mentioned are used.

Clamps for Thermit Welding Compromise Rail Joints

CONSIDERABLE interest has been taken in the device for holding short sections of rail while they are being welded together to form a compromise joint, developed and built by the Birmingham Electric Company, Birmingham, Ala. A short account of it was published in the issue of this paper for June 18, 1927. The design of this device was brought about because of the large number of compromise joints required following the adoption of the A.E.R.E.A. 7-in. girder rail for replacing special work as it is renewed. As it was not found practicable to make the necessary compromise joints under traffic and as the work of lining them up and clamping them in position for welding them by hand took a long time, the machine was built.

Two illustrations of the machine, one of them a working drawing, are published herewith. The bedplate, which has four legs, has at the top four upright arms whose lower surfaces are planed accurately so as to align the tops of the two rails to be welded. On the opposite side from these arms are two screw clamps which, with two 6-in. air plungers below, hold the two rails firmly while they are being welded. Before these clamps are finely set up, the rail ends are forced together by a longitudinal screw clamp.

The thermit cupola is held in a hinged frame so that it can be swung aside while the rails are being aligned. It is then swung back so that it will discharge directly into the joint weld mold.



This view shows the way in which the rails are aligned and clamped and in which the thermit cupola is swung out of the way while this work is being done

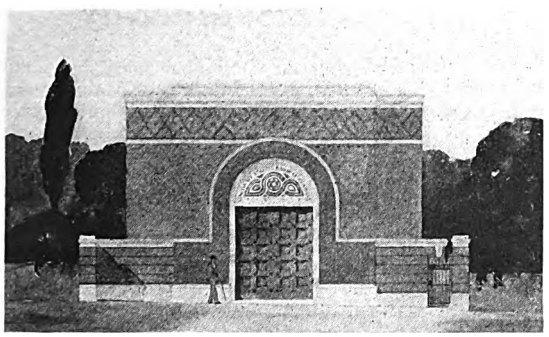
Cincinnati Adopts Supervisory Control for Power System

By Harley L. Swift

Superintendent of Substations Cincinnati Street Railway, Cincinnati, Ohio

COMPLETE revamping of its power distribution system has been decided on by the Cincinnati Street Railway. Under a plan which recently has been embarked on the street railway's power plant will be sold to the Union Gas & Electric Company of Cincinnati. Power for the railway will be purchased from this company and distributed through nineteen full automatic substations, all of which may be controlled by a centrally located load dispatcher or supervisor.

About half the power now comes from the railway's Pendleton generating plant at three-phase, 25 cycles, while the remainder is purchased from the power company at three-phase, 60 cycles. The Pendleton plant supplies five manual substations, while the power company

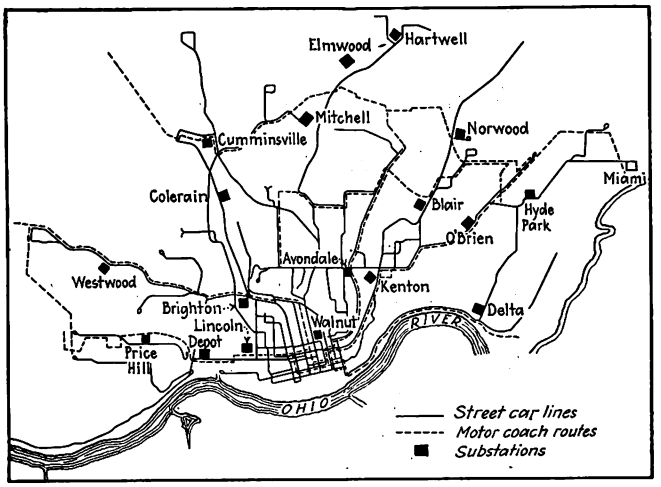


Architect's drawing of the completed Colerain substation

supplies three full automatic stations, three manual stations and a converter in one of the 25-cycle railway substations.

The new plan calls for the abandonment of one substation, the remodeling of nine substations and the building of ten new ones. The average distance between the stations will be about 1 mile. The most remote station will be about 8½ miles from the load dispatcher's office, which will be adjacent to the Walnut Street substation, almost in the heart of the business district of Cincinnati.

The interior arrangement of all new buildings, and in so far as is physically possible of all the old buildings, will be exactly alike. All the equipment will be located on one floor and in one room. There will be no windows, but there will be two doors, one of which will be for emergency use only. To prevent further the transmission of noise the converter will be mounted on 2 in. of either Armstrong or Korfund machinery isolation cork and the ventilators will be made of Robertson's protected metal.



The new Cincinnati railway power plan calls for full automatic supervisory controlled substations

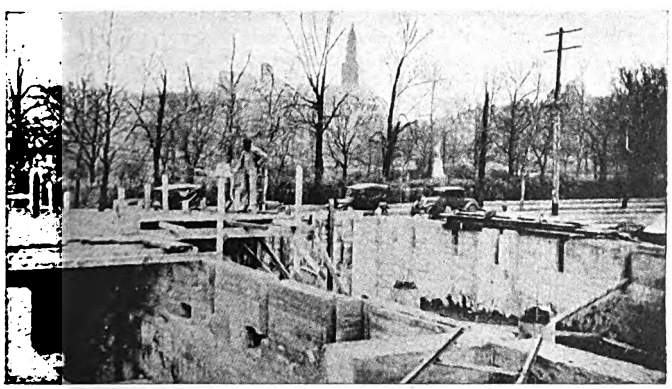
Both single-unit and two-unit stations will be built and ample provision will be made for future additional power requirements. The double-unit stations will be 38 ft. x 75 ft. and will contain two 1,500-kva. converters. The single-unit stations will be 38 ft. x 40 ft. and will contain either one 1,500-kva. or one 1,000-kva. converter. The transformers and high-tension bus structure will be inside the buildings.

Exteriors have been planned to fit the neighborhoods in which the stations are to be located. Several of the stations are to be in high-class residential districts where the City Plan calls for a set type of construction. Beautified structures have been planned for such instances, while all the buildings will be a credit to their localities.

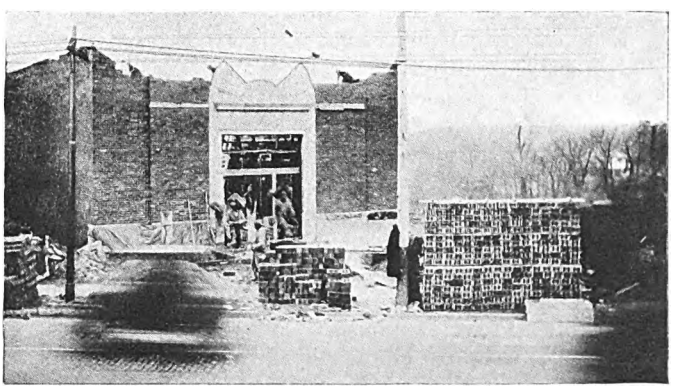
Four buildings are now practically completed, and contracts for five additional buildings are being let. It is expected that the entire program will be completed and in service by June 15, 1928.

The General Electric Company has the contract for furnishing all electrical equipment and for remodeling the present alternating-current controlled automatic stations to function under the General Electric direct-current scheme called for under the contract.

A later article will describe in detail the equipment, buildings, and operating plans.



The Lincoln Park substation as it appeared on Dec. 2. This indicates the character of the territory



The Westwood substation on Dec. 2. The general appearance may be seen from the illustration

Monthly Prize for December in Maintenance Contest

Won by D. S. MacKay

Machine for changing tires of buses as developed by the Boston Elevated Railway awarded the $25 Monthly Prize for December in "Electric Railway Journal's" Maintenance Competition. Efficient system for dipping and draining field coils used by the Georgia Power Company received Honorable Mention.

CHANGING tires on buses is an every-day job and considerable equipment has been devised for simplifying the work. Most commercial equipment, however, is designed particularly for automobile garages and is not considered satisfactory for the heavy duty service of removing bus tires. A tire-changing machine designed particularly for bus maintenance as developed by the Boston Elevated Railway and as submitted in the maintenance contest by D. S. MacKay, supervisor of automotive equipment for the company, has a much stronger construction than the usual type of machine. It has the appearance of a very practical piece of equipment designed to give satisfaction in heavy duty service. Provision is made for tilting so that there is no necessity for lifting the wheel to its place, making it a decided labor saver. That five tires can be changed in the time formerly required for one commends the device for use. The machine provides a large bearing surface on the tires, and being designed particularly for bus service is strong and hardy in every way. It gives a simple and quick method for changing bus tires.

A description of the machine and its use were published in the Dec. 17 issue of ELECTRIC RAILWAY JOURNAL. It was submitted in the contest by D. S. MacKay, supervisor of automotive equipment for the Boston Elevated Railway, Boston, Mass.

A dipping and draining system for field coils as submitted by the equipment department of the Georgia Power Company, Atlanta, Ga., was awarded honorable mention by the contest judges. The equipment is arranged to take little space in the shop and provides an especially efficient method of dipping and draining. Besides conserving space, the equipment used given a neatness and cleanliness to the rather mussy operation of dipping and draining field coils. The labor involved is minimized through the use of this equipment and a maximum of the drippings are salvaged.

Competition for the December prize was very close. The items selected for the monthly prize and for honorable mention were two of the group published in the December 17 issue. An additional group, which will be judged for the $25 monthly prize for January, is included in this issue. One of these will receive the award and another one honorable mention. Results of the contest each month are published in the issue of the JOURNAL devoted to maintenance and construction, which is the third issue.

The following gives a summary of conditions for submitting material in the contest.

1. Any employee of an electric railway or bus subsidiary may compete.
2. The author does not need to be the originator of the idea.
3. Articles may be submitted by several persons or by a department.
4. Any maintenance practice or device for electric railway or bus repairs may be the subject.
5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.
6. Illustration material may be in the form of drawings, sketches, blueprints or photographs. All sheets should be marked "Maintenance Competition."
7. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York.
8. A prize of $25 will be awarded each month for the best maintenance idea in the group published. A minimum of $5 will be paid for each article accepted for publication. Manuscripts will be received until April 30, 1928.
9. Announcement of the winner each month will be made in the issue devoted to maintenance and construction (the third issue each month) following the one containing the item.
10. Additional details were given in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

D. S. MacKay

who won the December prize in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest, is supervisor of automotive equipment for the Boston Elevated Railway. He has been in the employ of this railway and its predecessors since August, 1895. When he first became connected with the company, it was operated under the name of the West End Street Railway. During his long period of service he has served as wireman, repair man, motorman, inspector of buildings and car tracks, yard master, foreman in various car houses of the company, and in his present position as supervisor of automotive equipment. He was appointed to this latter position in 1924.

The Boston Elevated Railway at the present time maintains seven garages, four exclusively for buses. In these are stored a total of 416 pieces of various types of automotive equipment, which includes 242 buses. Mr. MacKay has evidenced a particular desire to utilize the latest improvements in equipment for expediting the handling of maintenance and repair work, and the many improvements to equipment which he has worked out, show the thoroughness with which he is considering the maintenance side of bus operation.

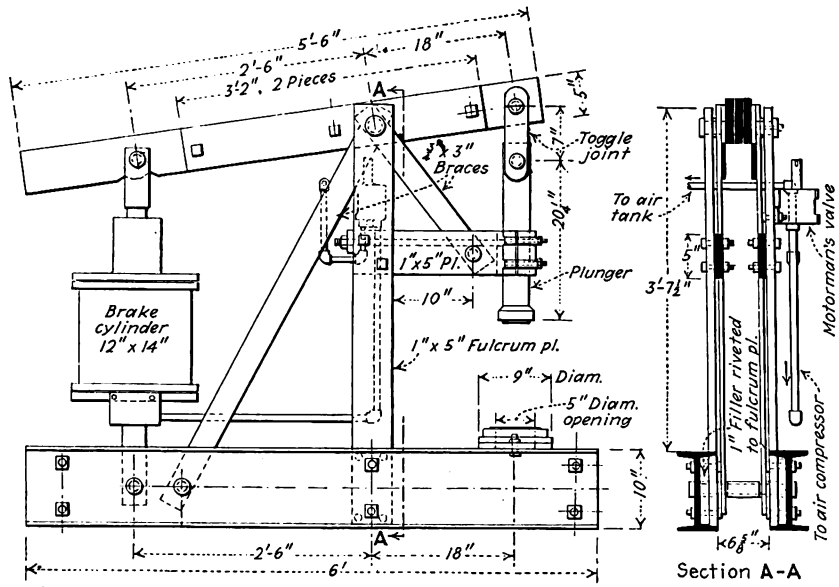
Press Saves Time in Bearing Removal*

By J. A. Duffy

Superintendent of Equipment Monongahela West Penn Public Service Company, Fairmont, W. Va.

WE USE a home-made press in our shops for very many forcing operations, the principal one of which is pressing out bearings. With this the source of power is a 12-in. x 14-in. brake cylinder which is attached to one end of a rocker arm, while the other end supports the plunger used in the forcing operation. The base for the press is made of two 10-in. I-beams. The brake cylinder is pivoted to this in order to avoid the use of a slotted or oblong hole in the power arm, as we have found the pivoted construction better. The plunger has a center bearing support, so as to insure accurate vertical movement. It is connected to the power arm through a toggle joint. Air pressure is controlled by an ordinary straight air brake valve.



Air press used for various pressing operations in shops of Monongahela West Penn Public Service Company

Efficient Commutator Slotting Device*

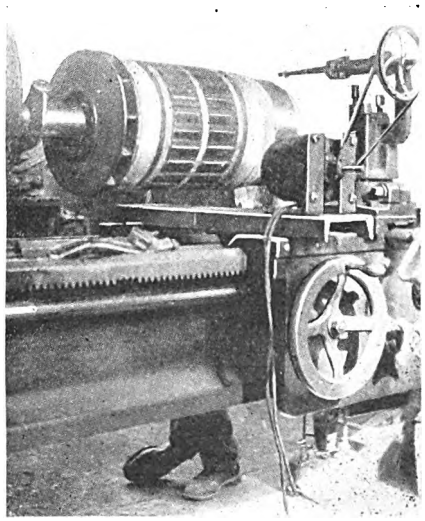
By H. A. Albin

Superintendent Lancaster, Ephrata & Lebanon Street Railway, Lebanon, Pa.

COMMUTATOR slotting is done by an inexpensive and efficient undercutting device constructed and used in the shops of the Lancaster, Ephrata & Lebanon Street Railway. It can be used to slot the commutator of any armature which can be swung in a lathe.

A shaft with a commutator saw on one end and a pulley on the other is supported by two bearings attached to an upright of a piece of steel strap, bent to U shape. The other upright side of the iron is clamped to the binding post of the lathe in which the armature is swung. With this arrangement it is unnecessary to have a guide to keep the saw from damaging the commutator segments, as when the lathe is centered the running of the carriage back and forth provides the desired accurate alignment.

The shaft on which the saw is mounted is driven by a small electric motor which is fastened to a U-shaped bracket, which in turn rests on the carriage of the lathe. The motor is belted to the pulley on the shaft.



Commutator slotting device used in the shops of the Lancaster, Ephrata & Lebanon Railway

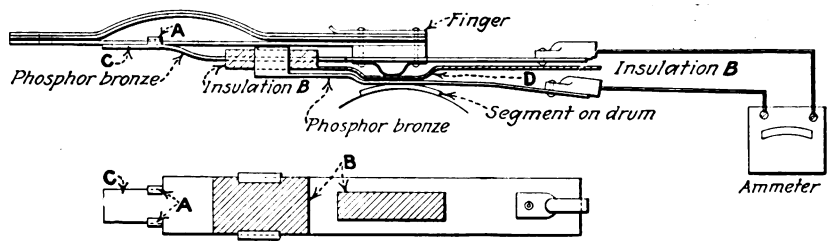
Double Contact Current Measuring Device*

BY ARTHUR E. CLEGG
Foreman Electrical Department, San Diego Electric Railway, San Diego, Cal.

CAUSES of trouble in electrical circuits on cars of the San Diego Electric Railway are located by a double contact current measuring device which the electrical department uses to obtain an ammeter reading. This device can be put in the circuit of a drum switch very quickly in the following manner:

The finger of the switch should be raised just high enough to pass the end of the current measuring device under it so that the contact tip of the finger will rest in the slot designated on the accompanying illustration as *B*. The clips *A* are then fastened to the finger spring and the spring effect of *C* bearing against the finger spring makes a good electrical contact. A heavy-treated canvas is used for insulation to separate the two contacts *C* and *D*, which are made of phosphor bronze.



Double contact current measuring device

The contact tip of the finger resting in slot *B* bears down on the contact *D* as it comes in contact with the segment of the drum. To provide leads to the ammeter at the end of each contact a terminal is fastened by means of a rivet and soldering. Leads of convenient length and proper carrying capacity are soldered into the terminals. These leads can be brought through the car window and connected to an ammeter when the double contact measuring device is inserted in either the reverser or motor cut-out switch circuit if these are of drum type.

Phosphor-Bronze Armature Bearings Profitable*

BY R. T. CHILES
Master Mechanic
Cumberland County Power & Light Company,
Portland, Me.

ONE of the most profitable maintenance practices in use on our property is that of operating phosphor-bronze armature bearings without babbitt or tin lining. We have been using these bearings for the past five years and have had wonderful results. For the year 1926 the following was the average armature bearing mileage:

Type Motor	Number of Motors in Active Service	Bearing Miles
GE-67	114	52,189
GE-80	138	80,705
GE-201 G, GE-203A, GE-247-B	140	173,965

The composition of the metal used in the bearings is 80 per cent copper, 10 per cent tin, 9 per cent lead and 1 per cent phosphorus. Bearings are bored 0.015 in. larger than the armature shaft and all armature shafts are inspected carefully for trueness. After the armature is installed in the motor frame particular care is taken to see that it can be rotated by hand.

In fitting armature bearings to the frame head of box frame motors the armature bearing is pushed into the frame head with a wheel press. We have never had to take a car out of service to remove an armature for bearing wear in our box frames type of motors. The equipment is overhauled completely on an average once every three years and during this overhauling, if we find an armature bearing worn 0.041 in. larger than the armature shaft size it is removed. Usually our removals are for pinion end bearings being loose in the frame head. Armature shaft wear has never been unusual.

Periodic Testing of Field Coils Reduces Trouble*

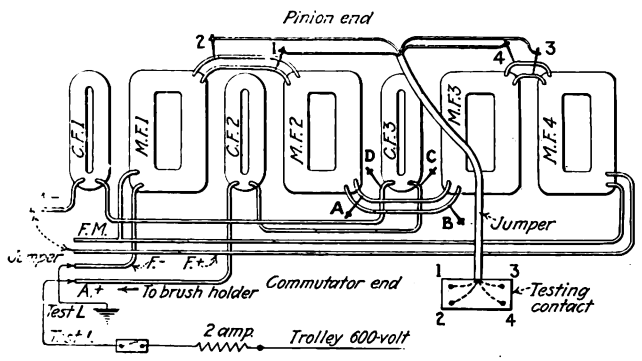
BY FARRELL TIPTON

Electrician San Diego Electric Railway, San Diego, Cal.

IT IS the practice of the San Diego Electric Railway each time a motor is removed from a car to give the windings an electrical insulation test. Fields are tested by the drop potential method to give the insulation resistance between turns. To facilitate this work a test jumper shown in the accompanying illustration has been devised. With this one man can make the drop potential test in a minimum time.

The jumper is made of four No. 14 gage wires, 36 in. long. These are cabled together within 15 in. of the test pins. One end of each wire is fastened to a small sharpened steel pin by means of two nuts and a brass washer on which a symbol is stamped. The other ends of the wires are fastened to terminals on the testing board. These have symbols corresponding to those on the other ends at the test pins. Additional test pins are used to make millivoltmeter contact.

The test board is made of bakelite. It is 5 in. long, 3 in. wide and ½ in. thick. Brass machine screws are used for terminals and testing contacts. In using this test equipment the pins are inserted at given points and the drop across each coil is read separately by placing the test points of the millivoltmeter on terminals as listed in the accompanying table:



Details of field coil testing device

Field Coil Under Test	Points of Contact
Commutating field No. 1	A— and D
Commutating field No. 2	A+ and C
Commutating field No. 3	D and C

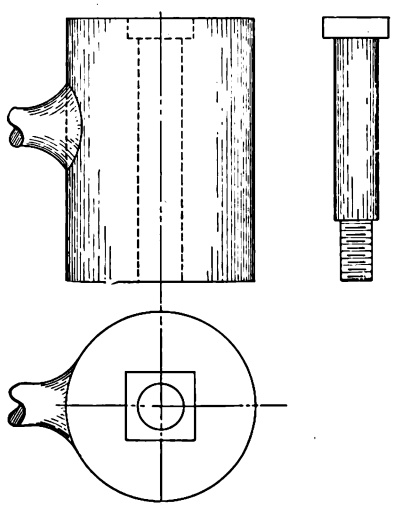
Die for Making Truck Swing-Link Bolts*

BY CHARLES HERMS

General Foreman San Diego Electric Railway, San Diego, Cal.

SWING-LINK bolts used for trucks by the San Diego Electric Railway are made in a die shown in the accompanying illustration. It is made of a piece of an old axle and is the exact length of a finished bolt. The hole of the die is bored about 0.005 in. larger than the desired shank of the bolt to allow for expansion while hot.

Cold-rolled steel stock is used and this is cut off just long enough to allow for a full head. A dozen or more of these pieces are thrown into the fire and heated to a white heat. They are then removed one at a time, and before inserting in the die each one is quenched in cold water so that just enough of the stock remains hot to form the head. The piece is then placed in the die and usually two light blows from a steam hammer finishes the head. By inverting the die the bolt slips out freely.



Die used to form swing-link bolts for trucks

After the bolts are headed they are sent to the machine shop and the ends are turned down and threaded. Where cold-rolled steel is used it is not necessary to turn the shank. After threading, the bolts are drilled for cotter pins and are then sent back to the blacksmith shop for case hardening.

The total cost of material and labor, including overhead charges, amounts to 40 cents per bolt.

Commutator Wire-Slot Cleaning Tools*

BY FRANK VOLENEC
Armature Winder Omaha & Council Bluffs Street Railway, Omaha, Neb.

WHEN an armature is stripped there is always more or less old solder remaining in the commutator wire slots which must be removed before rewinding. This is usually considered a tedious task by the repairmen. In the shops of the Omaha & Council Bluffs Street Railway a set of slot-cleaning tools has been made for the different types of armatures to do this work easily and thoroughly. These tools were made from old files ground to the proper shape. The tools are all similarly shaped but of different thicknesses, depending on the width of the wire slot to be cleaned.

Shaped like a shaper tool and having three cutting edges, the tool in one operation cleans the sides and bottom of the slot. For clearance the tool is tapered away from each cutting edge. The corners of the file teeth at the upper end of the tool are ground away to make a handle for holding the tool while it is driven through the slot by means of a hammer.

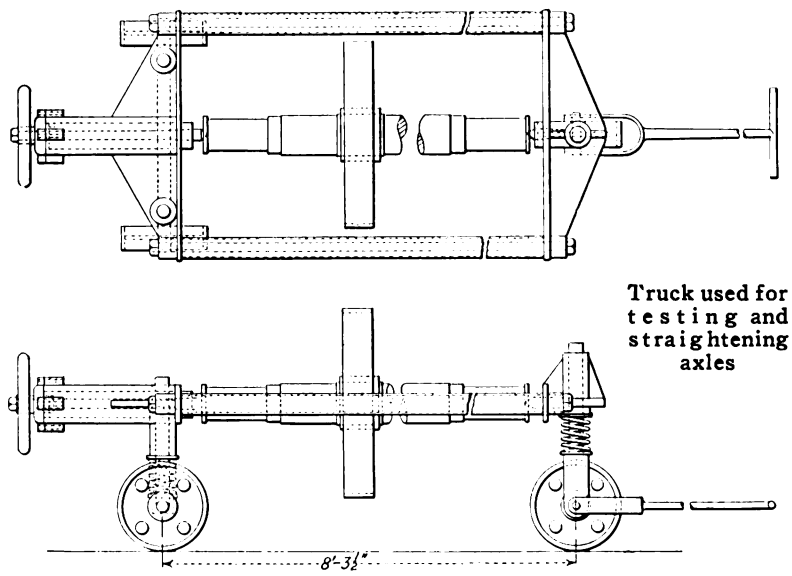
Centering Truck for Testing Car Axles*

BY A. TAURMAN
Superintendent of Equipment Way and Structures Birmingham Electric Company, Birmingham, Ala.

THE accompanying line cut shows an axle centering truck which has proved of particular convenience on our system. The truck was constructed in our shop to test axles after the wheels had been removed, to see that they were perfectly straight. Where the testing shows that the axle is bent the truck is pulled over to a vertical hydraulic press and the straightening is done readily without removing the axle from the truck. After the straightening the axle can be tested in the centers on the truck without removal. The spring between the frame of the truck and the axle allows the truck to be depressed when the straightening operation is carried out and eliminates the necessity of taking the axle from between the centers. This method of handling bent axles eliminates the necessity of heating them, as it has been found that they can be straightened very much better cold. The practice of the railway heretofore was to heat axles and put them in a lathe, which required considerably more time and handling than the present practice.



Truck used for testing and straightening axles

Card Records Show Condition of Equipment*

By Ed. C. Kelly

Shop Foreman Virginia Public Service Company, Hampton, Va.

CAR repair records are kept in a compact and readily available form in the shop of the Virginia Public Service Company, Hampton, Va. Cards 5 in. x 8 in. are used indexed with Smith's "Opnwindo" steel guides. The cards are kept in cases 10 in. x ½ in. x 17 in., which provide a capacity for 1,000 cards.

All bearings, armatures, wheels, etc., are given serial numbers in their respective classes. To aid in following frequent changes in equipment the various parts and position on the cars are identified by numbers stamped near the pedestal jaws, or some other convenient place. Starting to number at one end, odd numbers are used on the left side and even numbers to the right.

In keeping records, armature bearings, axle bearings, wheels, etc., are entered on separate cards and are filed with each car record. As armatures are changed more frequently than other pieces of equipment these are given individual cards. Cards are filed with the record of the car in which the armature is operating, spare armatures being held under "shop" heading. Upon completion of a job involving a change of equipment permanent record is made on a "put in" slip.

TRACK AND WAY DEPARTMENT—15

Concrete Ties Effect Saving*

By Louis T. Botto

Superintendent Maintenance of Way Department, San Antonio Public Service Company, San Antonio, Tex.

BY THE installation of concrete cross ties in place of wooden ties, a considerable saving in first cost has resulted on lines of the San Antonio Public Service Company, San Antonio, Tex. In the concrete construction it is general practice to build a temporary track around the work in order that the new construction may have fifteen days in which to harden. A job now in progress, however, is at a point where the company's tracks cross the switching yards of the I. & G. N. Railway. At this point it is impractical to build a temporary track, so the following method is used:

Every other wood tie is removed and in its place a concrete tie is cast. The construction includes a Carnegie steel tie, M-23, as the core. Tie bolts are placed in the bolt holes and are spot welded to the tie. The tie is then placed in position and blocked up under the rail, using bricks and shingles for blocking. Steel reinforcing wire is placed around the tie and spot welded in several places to the top of the tie. A form is then built around the tie and a 1:2:4 mixture of concrete poured, making the completed tie 8 in. x 10 in. x 7 ft. long. Ties are kept damp by sprinkling for fifteen days, after which the forms are removed and the regular tie clips are applied. Ties are tamped up with air tampers and the nuts are tightened down on the ties in the usual manner. Wood ties are then removed and the remaining concrete ties are installed.

Concrete cross tie construction used by the San Antonio Public Service Company

No difficulty has been experienced in surfacing and lining track with concrete ties and it has been found as easy to do maintenance work as with the ordinary wood tie. It is felt that this type of construction is very desirable in close proximity to railway crossings which require frequent tamping.

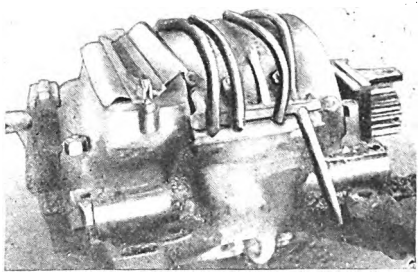
Method of Bringing Out and Fastening Motor Leads*

BY EQUIPMENT DEPARTMENT
Georgia Power Company

CONSIDERABLE trouble has been experienced on cars operated by the Georgia Power Company from axle jumpers becoming oil-soaked and grounding. Motor leads also get down on the axle and cause trouble with split frame motors. To remedy these conditions duraduct is installed over the leads and brackets are welded on the motors for fastening wooden blocks to cleat the leads.

In addition to the cleating, all motors now being overhauled are rewired so as to eliminate the axle jumpers. The bottom field lead is run back around the motor case through steel bushings welded inside the case and is brought out through a hole in the top of the frame along with the other motor leads.

Steel bushings through which the leads are passed are welded to the motor frame and the leads are then bound together with tape to hold them securely. This not only holds the motor leads away from the axle but prevents vibration. This change is being made on Westinghouse type 101-B and C, 112-B-2, 306 and 307 motors.



Motor with duraduct on leads and wood block supports

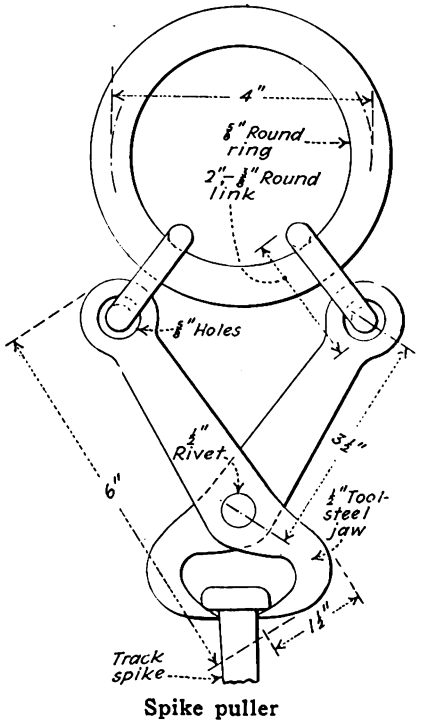
TRACK AND WAY DEPARTMENT—16

Convenient and Powerful Spike Puller*

BY JOSEPH MERCIER
General Foreman Track Service Division Montreal Tramways, Montreal, Canada

A POWERFUL spike puller that may be utilized even where shoulder tie plates or cramped quarters interfere with free movement of the claw bar has been devised by the track service division of the Montreal Tramways, Montreal, Canada. Two tool steel tongs about 6 in. long with hardened jaws, shaped to grasp the head of a spike, are attached to a 4 in. diameter by $\frac{5}{8}$ in. round mild-steel ring with two heavy links. With the jaws adjusted to grip the head of the spike, a pull on a bar slipped through the ring as it rests on the adjacent rail will draw out the most stubborn spike. This has proved a great time saver.



Spike puller

New Equipment Available

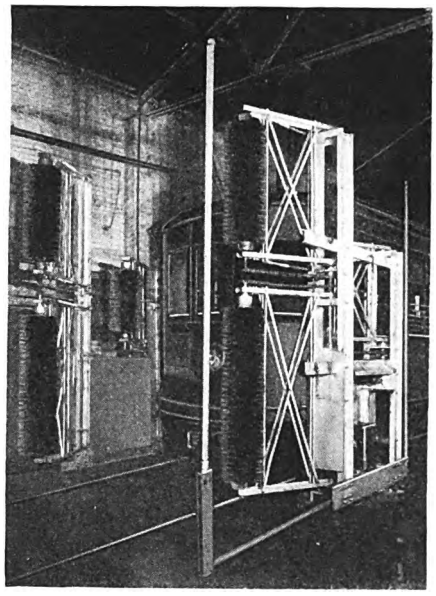
Beaver Valley Machine Scrubs as Well as Washes Cars

CAR washing machines other than those in which water is sprayed on the cars from vertical or horizontal pipes are not usual in this country. Even the rather primitive spraying devices are by no means common among electric railway companies. A machine which scrubs as well as washes the car is very much of a novelty here, although there are machines of this kind in Europe.

A combined scrubbing and washing machine for electric railway cars in use in the New Brighton, Pa., shops of the Beaver Valley Traction Company is shown in the accompanying illustration. It has been patented by two employees of the Pittsburgh Railways and the one illustrated is the second to be installed. It resembles one used by the Pittsburgh Railways and described in the JOURNAL for March 12, 1927. It consists essentially of three hinged arms on each side of the track, each set of arms carrying a vertical revolving brush, driven by chains from a vertical shaft driven by a motor. The arms are hinged so that they can be set to fit the width of the car to be washed. They have a range, in and out, of 9 in. on each side. In addition on each side of the track are two vertical perforated pipes. They supply the water sprays for washing.

After the arms are set to the proper width of the car the operation of the machine is entirely automatic. As the car approaches the washing machine a trip switch is thrown, starting the sprays and setting the revolving brushes in motion. One of the vertical pipes on each side sprays the car before it passes between the brushes. The second vertical pipe on each side sprays the car after it has passed the revolving brushes. The water in each case is directed toward the center of the track.

The water supply is arranged so that the water from the first set of vertical pipes can be chemically treated before it is sprayed on the car. The chemical used is the Imperial Company Simplex Cleanser, which is diluted to various degrees, depending upon the condition of the car and the extent to which it has to be cleansed. The second pair of vertical spraying pipes are supplied only with fresh water. Their purpose is to wash off all traces of the cleanser and the dirt which it has dislodged.



This Beaver Valley machine washes and scrubs the cars at the same time. It is adjustable for various widths of cars

Old Westinghouse D-2 E.G. compressor motors are used for driving the revolving brushes, which are fitted with soft bristles.

Single Operator Type Welder

WELDING by one man is facilitated by a new machine announced by the General Electric Company, Schenectady, N. Y., as the latest addition to its standard line of welding equipment. The machine, which is rated at 300 amp. for one hour with 50 deg. C. temperature rise, includes a ball bearing motor-generator set with flexible coupling. Field control for the generator has been eliminated. The generator panel includes an ammeter and a voltmeter, but no field rheostat such as is customarily used. The meters have metal fronts except for the glass over the scale, thus minimizing the possibility of breakage. Motor starters for 60, 50 and 25-cycle motors are of the inclosed magnetic type. The direct-current motors use a simple resistance starter with a time switch.

The generator is designed to permit belt, motor or engine drive and for either stationary or portable use. It bears the General Electric designation WD-300-A.

Put "No-Nox" in your maintenance, so your cars will operate with no-knocks.

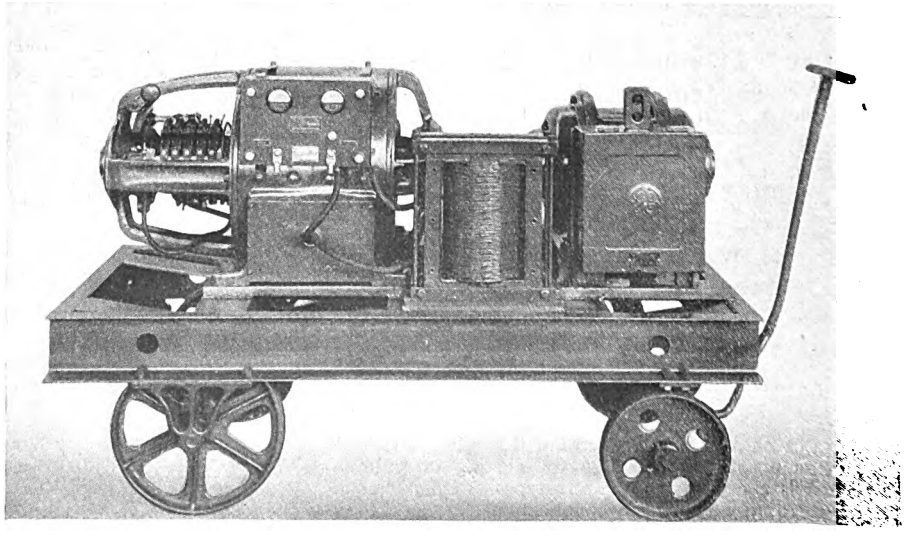
Improved Design of Reverser Finger

IMPROVEMENTS in reverser fingers for replacing the old V-shaped finger have been made by the Westinghouse Electric & Manufacturing Company. Use of this new type is said to result in better operation, longer life of both fingers and contacts and reduced maintenance cost. Other advantages claimed for the new design are:

1. Elimination of the riveted joints which loosen in service and cause heating, resulting in burning of fingers and contacts.

2. The shunt carries the current and the spring does not become overheated. This insures constant spring pressure throughout the life of the finger.

3. There is greater range of deflec-



New arc welder with alternating-current motor drive

Digitized by Google

tion within the prescribed pressure limits so that longer service is obtained from contacts.

4. The use of tinned contact surfaces reduces the resistance of the finger and prevents localized heating.

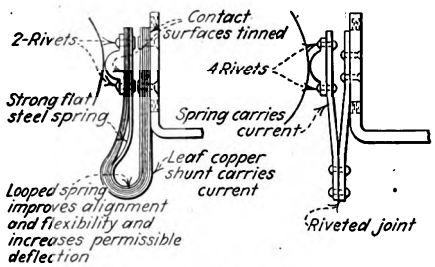
5. Contact tips are renewed more easily than with the older type. Due to contact surfaces being tinned, only two rivets are necessary to hold the contact tips of the fingers.

6. Greater flexibility insures proper alignment and maximum contact between contact tips and drum segments.

7. Longer life of finger segments is obtained due to reduced finger pressure and reduced heating.

The new reverser fingers have been standardized so as to use the fewest parts possible and permit the use of a relatively small number of finger assemblies to replace the old fingers. For the standardized design all copper tube terminals are fastened to the finger bases by means of through bolts. The tap bolts used on a few of the old fingers are eliminated.

For many purposes the new finger is entirely interchangeable with the old V-shaped finger. On some types of reversers it is necessary to change the strap terminal back of the finger when adopting the new finger. On a few other types, the fingerboard



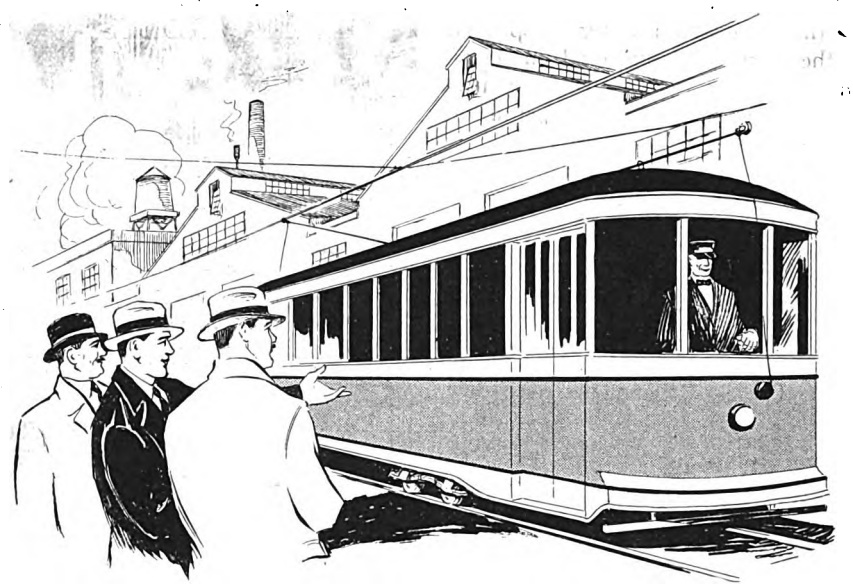
At left—New type of reverse finger. At right—Old finger which is replaced

must be changed or modified to permit its use with the new fingers. In every case the new fingerboard assembly using the new finger is interchangeable with the old fingerboard assembly.

When it is found necessary to replace the old V-shaped fingers, it is recommended that the reverser or changeover switch be changed to use the new finger. This should be done by substituting the new fingerboard assembly for the old fingerboard. At the same time the changeover is made the diameter of the drum should be checked. On type 173, 178, 279 and 284 reversers the finished diameter should not exceed $3\frac{1}{2}$ in. Wherever the contacts have been worn as much as $\frac{1}{16}$ in., they should be replaced with new cars.

Dick Prescott Paints a Car

And Starts a Train of Thought



SOME two weeks following the discussion of car painting by Dick Prescott, assistant superintendent of the Consolidated Railway & Light Company's shop, and Steve White, the carpenter shop foreman, Dick Prescott called up Mr. Milburn, the general manager, and announced that a sample car, painted in the new color scheme was ready for his inspection.

Early in the afternoon Mr. Milburn appeared at the shop and Dick promptly had the newly painted car run outside the building where it could be easily seen in the outdoor light from various angles.

Mr. Milburn stood back some distance from the car while Dick and Steve waited silently for his comments.

"Dick," he said finally, after looking at the car for some time from several positions, "I think that's an immense improvement. I can't understand why we didn't do something of this sore a long time ago."

"That's easily explained, Mr. Milburn," replied Dick, "I think there are two reasons: first we have never given much thought to the matter of improving the appearance of cars with paint, and in addition to that we have used colors which would stand up longest and hold costs to a minimum."

"That is probably true, Dick, but I believe that it was false economy. After all, paint cost is a comparatively small item in equipment maintenance. Even if we added to that item considerably it would not amount to very much money in comparison with the improvement that it makes in the appearance of our cars."

"I agree with you, Mr. Milburn. I think the added cost of keeping our cars well painted in attractive color combinations would be more than compensated for by the more friendly public attitude toward our service. That is an important step toward actual increased patronage by the people of the city."

"Dick, there isn't any question but that you're right. I think this makes an immense improvement in our cars. It will be good business to start in painting this whole group to attract some favorable attention while we are considering that new lot of cars we've discussed several times."

"Fine! Mr. Milburn, we'll get busy at once," exclaimed Dick. "These most recent cars of ours will look pretty good on the street when we finish with them. I do hope, though, that soon we can get rid of some of those old battleships on South Street. They're costing us a lot of money to operate and maintain, to say nothing of the way they look and ride."

"Come down to the office Friday morning, Dick, and we'll go over those figures again that you compiled some time ago," Mr. Milburn replied as he walked to the corner to board a street car bound down town.

Association Activities

Midwest Association Members Optimistic

Papers and discussions at the Hot Springs convention considered government ownership, pending legislation, franchises, transportation and mechanical problems

OPTIMISM prevailed at the sessions of the Midwest Electric Railway Association convention, which was held in Hot Springs, Ark., on Monday and Tuesday of this week. The 150 delegates present from seven states, including Utah, Colorado, Oklahoma, Missouri, Kansas, Nebraska and Arkansas, were given a most cordial welcome by Mayor Leo P. McLaughlin of Hot Springs and F. Leslie Body, manager of the Chamber of Commerce. F. G. Buffe of Kansas City, vice-president of the association, sounded the optimistic keynote of the street railway business today in responding, declaring that no organization could be in a state of hopeless decline which represented an investment of $6,000,000,000 and carried more than 16,000,000,000 passengers annually.

Comparing industrial conditions in the United States with those in foreign countries, J. B. Wootan, editor *Public Service Magazine,* Chicago, attacked government ownership of industries as inconsistent with the principles enunciated in the constitution and voiced by the founders of the nation.

In presenting a résumé of legislation pending in the present Congress Leslie Vickers, economist of the American Electric Railway Association, explained something of what the national association is undertaking to do through its New York and Washington offices to safeguard as well as to promote the interests of the electric railway industry. He urged that every effort be made locally in each state to keep its senators and congressmen adequately and intelligently informed concerning the problems of the electric railway properties in their particular territory.

F. Forman of Stone & Webster, in speaking of building a sales instinct in trainmen, stressed the value of public speaking instruction in helping organize an intelligent, judicious-minded body of railway employees.

There were two interesting luncheon sessions held the first day of the convention, which were turned into round-table discussions of transportation and mechanical problems with T. G. Kelly of Fort Smith, Ark., and W. J. Martin of Miami, Okla., as group leaders. The banquet was the social feature of Monday's sessions and was addressed by Former Governor Charles H. Brough of Arkansas, who warned against the doctrine of government ownership, and by Walter M. Ebel, editor of the Hot Springs *Sentinel-Record,* who expounded sympathetically on the relationship which should exist between the press and the public utilities.

Tuesday's session was opened with a paper on the place of the bus in urban transportation, delivered by D. E. Druen, superintendent of bus maintenance of the Kansas City Public Service Company. Present-day bus construction, in the opinion of Mr. Druen, is fast incorporating qualities of increased speed, improved riding and greater ease of handling and is obtaining them with an ever-increasing simplicity in mechanical construction.

Lantern slides illustrating a large number of the latest developments in modern electric railway equipment were presented and discussed briefly by Claude L. Van Auken, managing editor of *Electric Traction.* About 50 slides were employed to show the product of the foremost car builders. Problems of municipal transportation, particularly as they concerned the functioning of the service-at-cost type of franchise in effect for the past eighteen years in Cleveland, Ohio, were discussed in a comprehensive paper by C. M. Ballou, City Railway Commissioner of Cleveland.

Entertainment for the ladies attending the convention was not overlooked. In addition to a splendid luncheon for them on the first day they were taken for a drive over the city of Hot Springs and to near-by points of interest through the courtesy of the Chamber of Commerce. One of the interesting features of the convention was the exhibition of the new 38-passenger, 110-hp., twin motor coaches manufactured by the F. R. Fageol company of Kent, Ohio.

The program of the convention was concluded with a short business session, during the course of which Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, was called upon by President Cobban of Miami, Okla., for a few remarks. Mr. Gordon spoke of the feeling of optimism which has begun to make itself felt in the ranks of the railway industry and expressed it as his belief that the decline in the business of providing mass transportation with street cars has been pretty well halted, with consequent hope for a return to more prosperous days.

New England Motor Bus Association Formed

ELECTRIC railways and steam railroads have formed the New England Motor Bus Association, affiliating themselves with the American Automobile Association. The object is to promote co-operation and to give the public information about the motor coach transportation service, keep in touch with legislation and to work with the regulatory bodies in New England. Among the members are the following companies:

Union Street Railway (New Bedford), the Connecticut Company (headquarters,

Digitized by Google

New Haven), Worcester Consolidated, Springfield Street Railway, Boston & Maine Transportation Company (motor coach subsidiary B. & M.), Boston Elevated Railway, Middlesex & Boston, Interstate Limited Motor Coach Company (Fall River), Holyoke Street Railway, United Electric Railways (Providence), New England Transportation Company (motor coach subsidiary New York, New Haven & Hartford Railroad).

Officers have been elected as follows:

President, A. P. Russell, president New England Transportation Company; first vice-president, H. F. Fritch, president Boston & Maine Transportation Company; second vice-president, Edward Dana, general manager Boston Elevated Railway; third vice-president, W. J. Flickinger, vice-president the Connecticut Company; fourth vice-president, A. E. Potter, president United Electric Railways, Providence; secretary, R. M. Sparks, vice-president Interstate Limited Motor Coach Company; treasurer, E. S. Wilde, president Union Street Railway, New Bedford.

New York Association Program

DETAILS of the program of the mid-winter meeting of the New York Electric Railway Association are now available. The meeting will be held at the Hotel Commodore, New York City, on Thursday, Jan. 31.

Subjects at the day session, beginning at 10 o'clock a.m., are:

President's address.

"High-Speed Traction Motor," by N. W. Storer, consulting railway engineer Westinghouse Electric & Manufacturing Company.

Discussion, led by G. L. Kippenberger, vice-president and general manager St. Louis Car Company, and H. L. Andrews, assistant engineer railway department, General Electric Company.

"Local Transportation Must Keep on the Move," by Lucius S. Storrs, managing director American Electric Railway Association.

Informal discussion from the floor led by W. H. Sawyer, past-president A.E.R.A., and R. F. Carbutt, president Metropolitan Section A.E.R.A.

"Do Traffic Lights Relieve Congestion," by R. W. Emerson, vice-president and general manager Cleveland Railway.

"Control of Traffic as it Affects Street Car Operation," by K. W. Mackall, engineer Crouse-Hinds Company.

"Moving Traffic," by Hon. Philip D. Hoyt, First Deputy Police Commissioner, in charge of traffic, City of New York.

"Traffic Signals and Their Effect on Street Railway Operation," by H. N. Smith, consulting engineer Bureau of Gas and Electricity, Syracuse, N. Y.

"Brakes as They Affect Schedule Speed and Accidents," by E. R. Fitch, district engineer Westinghouse Traction Brake Company.

Discussion led by J. S. McWhirter, superintendent of equipment Third Avenue Railway, and Hugh Savage, superintendent of equipment Brooklyn City Railroad.

The annual dinner will be held at the Hotel Commodore the same evening, beginning at 6:30 p.m. W. G. Gove, president of the association, will be toastmaster. The speakers will be Roland B. Woodward, general secretary Rochester Chamber of Commerce, and Captain Irving O'Hay, U.S.A. (retired.)

Buffet lunch will be served at noon on the day of the meeting. Those who desire to attend the dinner should make requests for reservations at once to the chairman of the committee, A. L. Hodges, assistant general manager Brooklyn City Railroad, 168 Montague Street, Brooklyn, N. Y.

Maryland Association Announces Meeting

ON MARCH 23, 1928, the Maryland Utilities Association will hold its annual meeting at the Emerson Hotel, Baltimore, Md. The program has not been completed but papers of interest to public utilities will be presented and discussed at the meeting.

Special Sleepers for Southern Equipment Delegates

SPECIAL Pullman sleeping cars will be provided for members of the Electric Railway Association of Equipment Men, Southern Properties, bound for their convention to be held in New Orleans, Jan. 25-27. The cars will be attached to the Piedmont Limited of the Atlanta & West Point Railroad at Atlanta. The train leaves at 4:20 p.m. on Jan. 24 and arrives in New Orleans at 7:20 the next morning.

Officers of International Association

THE full list of officers and executive committee of the International Street and Interurban Railway and Bus Association has been announced. Under the terms of consolidation of the two former European associations, representatives from Central Europe were elected to the governing body. The names of the present officers follow:

President: F. de Lancker, Brussels.

Honorary Vice-President: G. Pavie, Paris.

Vice-Presidents: Ch. Thonet, Brussels; A. Mariage, Paris; Max Drager, Berlin.

Members of executive committee: Ch. Rochat, Geneva; L. Boulle, Paris; L. Caufriez, Brussels; le Marquis de Foronda, Barcelona; Fr. Level, Paris; le Commandeur Salvadori di Wiesenhoff, Turin; le Commandeur Natoli La Mantea, Palermo,; J. W. Van Der Vegt, The Hague; L. Noirfalise, Liége; A. Falkenberg, Lilleaker, Norway; G. Hellgren, Stockholm; Al. Kuhn, Warsaw; L. Graux, Brussels; Wilhelm Stein, Hamburg; O. Lowit, Mannheim; L. Spängler, Wien; St. von Sztrokay, Budapest.

Secretary General: A. de Backer. Brussels, Belgium.

American Association News

Rolling Stock

LAYING out and general discussion of work to be done by various special committees of the Rolling Stock Division for the year constituted the principal business of the general rolling stock committee at its meeting at association headquarters in New York City on Dec. 9. Those present were A. T. Clark, chairman; C. Bethel; W. C. Bolt; J. M. Bosenbury; R. S. Bull; J. A. Brooks; R. W. Cost; M. R. Hanna; A. D. McWhorter and R. B. Smith.

The various assignments to special committees were gone over and discussed. Suggestions were made of things desirable that could be properly taken up by the chairman of the special committees. For special committee No. 1 on the review of the Manual, the branding of hose was discussed and recommended for study in connection with revision. In connection with the work of special committee No. 2 on motor coaches, it was considered desirable to make a study of motor coach lighting. This work, however, was in line with work being done by special committee No. 4, and so this committee will investigate the subject. Another subject considered for investigation by special committee No. 4 was headlights. Opinion was advanced that stronger headlights were desirable for city cars.

On assignments of subjects to last year's committees that were not completed, the work will be taken up at the point left off and an attempt made to complete it as soon as possible.

Louisville, El Paso and Wilmington Win Brady Safety Medals

THREE Anthony N. Brady Memorial medals for outstanding accident prevention and health promotion work on electric railways, for the year ended Dec. 31, 1926, have been awarded to the Louisville Railway, the El Paso Electric Company and the Tide Water Power Company of Wilmington, N. C. The Pittsburgh Railways received honorable mention and was voted a certificate. Announcements of the awards have just been made jointly by the American Museum of Safety and the American Electric Railway Association.

The medal awards for 1926 were made to the three electric railway organizations graded according to receipts, making the best record in accident prevention and health promotion, according to records submitted. One prize is given in the class of companies operating upwards of 5,000,000 vehicle-miles, one for companies between 1,000,000 and 5,000,000, and one for companies with less than 1,000,000 vehicle-miles. The committee's purpose in this, it was announced, was to promote active competition for the awards by every electric railway, however large or small.

News of the Industry

Patrons in Biddeford Desire Fare Boost and Continuance

An unusual petition signed by residents of West and Granite Streets in the city of Biddeford, Maine, has been presented to the officers of the Biddeford & Saco Railway asking that the present fare of 5 cents be doubled. The petition, signed by about 50 residents, asks that the increase in fare be granted in order that the line may be continued in operation.

When the York Utilities Company abandoned its line between Biddeford and Kennebunk, the Biddeford & Saco Railway continued to run cars over the line from City Square to Proctor Road in North Kennebunkport. Following a short trial period the company found that this operation did not pay, and it was then cut down to a distance of about 2½ miles on a 5-cent fare with a half hour schedule for ten hours daily. But when service could not be maintained under the present fare tariff, the officials discontinued the service, and notice was given that no cars would be run after Jan. 14.

The petition, however, reopened the question and it is understood that the railway officials will take the matter up with the Public Utilities Commission in an effort to work out some new plan. The road is desired for the convenience of employees and other residents.

Increased Fare Asked in Tulsa

The Oklahoma Union Railway, Tulsa, Okla., has applied to the State Corporation Commission to increase fares on its lines in Tulsa. The rate asked is 10 cents for a single fare and 25 cents for three fares sold at one time. The former rate was 7 cents for a single fare and 25 cents for four fares.

The rate asked is higher than that recently granted to the Tulsa Street Railway; the latter company receiving 8 cents for a single fare and 15 cents for two fares.

According to O. M. Sewell, vice-president of the company, the increase is asked in order to put the fares on a parity with those of the bus lines which the company operates through a subsidiary concern, the Union Transportation Company. The bus lines were granted the higher rate more than a year ago.

The application does not ask for increases on the lines out of the city. In asking for the increase the company filed a statement alleging that it has sustained an operating loss of $377,152 since 1923. It claims that even the increase will not entirely overcome this loss as the increased amount to be raised yearly is estimated to be only $30,950.

A reason for asking the increase is that transfers can be issued between the bus lines and the railway. At present the difference in fares on the two forms of transportation makes the issuing of transfers impossible. It is also said that a transfer system would be arranged between the O.U.R. lines and the Tulsa Street Railway if the new rates are granted. Transfers between the two railway lines are in effect, although the Tulsa Street Railway has recently been enjoying a slightly higher fare.

The case has been set for hearing at Oklahoma City on Feb. 14.

New Rochester Line Not Ready for High Speed Operation

After a little more than a month of operation, the $12,000,000 subway at Rochester, N. Y., has been found unfit for high-speed traffic until tracks are reballasted and other faults corrected, at a total cost of at least $50,000.

This disclosure was made after an inspection trip by city and railway officials. It has become a live political issue in Rochester, threatening a split between the new city manager government, which took office on Jan. 1, and the old Republican machine politicians.

It was found that before the subway was ready for the high-speed schedule planned for it this month, with installation of the block signal system completed, much reballasting must be done along the 8-mile stretch of trackage in the abandoned Erie Canal, sharp curves must be eliminated, leaky platform roofs at stations repaired and a general clean-up of the cut made.

Officials of the New York State Railways were emphatic in declaring that under no circumstances should the company be obliged to fix up the road, as it was supposed to be in running order when it was handed over by the city for a three-year trial operation.

The subway was opened for partial operation on Dec. 1, but it was hoped to have it in full swing by Jan. 15, a hope that has gone glimmering with the discovery of the flaws in the line.

Fare Increase in Youngstown With Weekly Pass Restored

A new fare schedule calling for 10 cents cash on both buses and cars, a no transfer charge, six tickets for 50 cents and a weekly pass for $1.50, on the lines of the Youngstown Municipal Railway, Youngstown, Ohio, is to be given an eight weeks' trial. In voting for this increase in fare the City Council set Feb. 5 as the beginning date. The present fare is 8 cents cash, seven tickets for 50 cents with a 1-cent transfer charge. Service improvements are authorized.

Utility Investigation Meets Criticism

Opposition varied by companies, commissioners and bankers to Senator Walsh's resolution. Senator Lenroot issues challenge to Senator Walsh

VIGOROUS opposition to the Walsh resolution — opposition of a character calculated to impress Congress more than any that could be exerted by the utilities themselves—has come from the utilities commissioners of the states, from investment bankers and from representatives of securities owners.

When Senator Watson of Indiana called the interstate commerce committee of the Senate to order on Jan. 16 he said that the committee must consider the advisability, necessity and expense of an investigation into the conduct of public utilities of the far reaching character indicated in the resolution which he read. Thereupon Senator Walsh, made a long statement in justification of a minute inquiry by a special committee of the Senate into virtually every phase of the public utility business. He asserted in the course of his argument that "there is a view entertained by not a few people that the state commissions are not really functioning as they should because these utility corporations are constantly contributing large sums to control elections, and in one way or another they thus control state conventions."

A committee representing the National Association of Railroad and Utilities Commissioners made a special point of Senator Walsh's statement in a report which was submitted to the committee at its subsequent session. The report concludes:

> The commissions declare themselves opposed to invasion by the federal government in any manner of the rights of the sovereign states in the control and the regulation of public utilities. Therefore these commissions are opposed to any action of Congress that might result in an invasion of state rights or the substitution of national for state utility control.

Henry R. Hayes, president of the Investment Bankers Association of America, said:

> The public utility industry is now in a very desirable condition of prosperity. The reason for this is because, as a whole, it is economically sound throughout. It supplies "products" the usefulness of which is constantly growing and virtually universal and unlimited. Through its technical, managerial and financial progress it has consistently effected improvements and expansion to meet, economically and efficiently, the ever-increasing demands of the public. It is ever a pioneer, going continually into new fields, even today bringing electric service to the farmer in a degree not practical a few years ago. It is a vital part of the industrial, the civic and

Digitized by Google

the home life of the nation, an integral factor in the country's prosperity, its creation and distribution of new wealth.

The committee on Wednesday heard the argument of former Senator Irvine L. Lenroot, counsel for the Joint Committee of National Utility Associations.

Senator Walsh on Monday read into the record an interview in the Brooklyn *Eagle* with Owen D. Young, chairman of the board of the General Electric Company, in which he stated that the utilities would not oppose an investigation. Mr. Lenroot read a part of that interview in which Mr. Young declared that the utilities would not oppose an investigation by proper authorities when specific charges had been made. Mr. Lenroot insisted that no specific charges had been made against the utility companies and issued a direct challenge to Senator Walsh to show the contrary.

Ten-Cent Fare for Macon

Ten-cent fare for the casual rider with four tickets for 30 cents will go into effect sometime in February, after the Macon Railway & Light Company, Macon, Ga., has finished $314,000 in improvements now being installed in an effort to bring more patronage to the transportation system. L. A. Magraw, general manager of the company, said:

There is no widely established precedent to indicate that the improved service and equipment will in any way increase the patronage of the system. It is only a hope that this expenditure will provide in Macon a solution of the problem being faced by transportation companies in all of the smaller cities and most of the larger municipalities. This problem has manifested itself during the last eight years through decreased patronage brought about by automobile competition.

The twelve new cars that have been ordered by the company will arrive and be put into service upon completion of the new tracks. Many schedule changes that will have a tendency to offer increased service during the rush hours will be put into effect, it is understood.

Petition for Special Transit Session Approved in Chicago

In the belief that so clear an expression of the desires of citizens of Chicago would virtually force Governor Len Small to call a special legislative session to consider the city's traction enabling bills, the City Council committee on local transportation on Jan. 16 approved a plan to circulate a petition for 100,000 signers urging the Governor to convene the legislature for a second time since the close of the regular term last summer.

Forty thousand petitions, each bearing space for 25 names, are to be sent out immediately by the committee to large industrial plants, clubs, and civic organizations for their aid in obtaining signatures.

The five transit bills representing the city's views have not been put in final form yet, but it was indicated at the councilmen's meeting that they would be ready if the Governor should call a special session.

Lavish Christmas Decoration in New Jersey

Public Service Terminal Building, Newark, N. J., the main office of Public Service Corporation of New Jersey and its various subsidiary companies, was elaborately decorated for the Christmas holidays. Many of the commercial office buildings in various parts of New Jersey also were decorated in keeping with the holiday spirit. Carhouses and garages of the transportation companies had Christmas trees.

Proclaiming Christmas in New Jersey

The entire front of the building on Park Place was trimmed with garlands and lights, from the top to the first floor. The garlands were draped in graceful loops at the eaves and hung in vertical lines of various lengths over the face of the building. Huge wreaths and Christmas trees were placed against the grilled arches between the first and third floors and were electrically lighted. Seven huge lighted red candles were placed on the ledge above the second floor cornice. They ranged in length from 10 to 40 ft.

On the Canal Street side there were wreaths and trees similar to the decorative scheme employed on the arches between the first and third floors on the Park Place front. At the extreme top of the center flagpole a 3-ft. high illuminated star was set and streamers were draped from the pole to the edges of the roof.

Postponement Sought in St. Louis Rate Case

Another postponement of at least three months in the hearing by the Missouri Public Service Commission in the valuation rate case of the St. Louis Public Service Company was requested on Jan. 9 by City Counselor J. T. Muench of St. Louis. The commission took the request under advisement.

The original application for a straight 8-cent fare was filed on June 3, 1926, and the company completed its case last May. At that time the city was granted six months in which to prepare an answer. A temporary increase from 7 cents to 8 cents, or two tokens for 15 cents, was granted by the commission on July 5 last, and will stand until the rate case is completed.

Contracts With Labor Unions Opposed by Detroit Commission

A resolution opposing working agreements with any labor union has been passed by the Detroit Street Railway Commission. This move was prompted by the demand of the business agent of the Detroit branch of the International Brotherhood of Firemen, Oilers, and Railway Laborers that the Detroit Street Railways enter into a working agreement with the members of that union. The agreement proposed, it was reported by the secretary of the commission, was intended to apply only to union members and would require the employment of all union men eight hours a day and six days a week.

It is the sense of the commission "that the unionizing of this or any other governmental agency or department is improper and opposed to public policy." Also "that the regulation of wages and working conditions in such department must rest with the governmental agency established to carry on the particular enterprise; that since this railway is owned by the city of Detroit, it is the property of all citizens of the city, and they all have equal rights in its opportunity for employment." It further states that while membership in a union is not properly an objection to any employee, membership in no organization can be allowed to give any employee special privileges or advantages over other citizens who do not belong to such organization.

Increase in Fares Between Canton and Massillon

The Public Utility Commission has granted the Northern Ohio Power & Light Company, Akron, Ohio, permission to increase its rates between Canton and Massillon as follows:

	Rate, in Cents	
	New	Old
Canton to Massillon.....	20	15
Canton to Jackson Lane.....	15	10
Canton to Whipple Road.....	06	05
Whipple Road to Jackson Lane.	10	05
Whipple Road to Massillon...	15	10
Jackson Lane to Massillon...	08	05

The round trip between Canton and Massillon is to be 30 cents. The former round-trip rate between these two points was 25 cents.

Commuter rates between Canton and Massillon are increased from 50 for $5 to 20 for $2.50.

The action of the commission follows the failure of the Commissioners of Stark County to grant an increase in rates.

Sunday "Passes" in St. Louis

Permission to sell "passes" over the lines of the St. Louis Public Service Company within the city of St. Louis effective Jan. 15 was authorized by the Missouri Public Service Commission on Jan. 9. City officials raised no objection to the proposal.

The order covers Sundays and holidays. Passes will be sold for 25 cents and will be good from 3 a.m. on date of purchase to 3 a.m. the following day. They will entitle the bearer to unlimited transportation on street cars within the established fare zone in the city limits. The purchaser may turn the pass over to other persons, but only one person may use the pass for the same trip.

Stanley Clarke, vice-president of the St. Louis Public Service Company, told the commission that his company wanted to stimulate the habit of car riding on Sundays and holidays.

The privilege to roam all over the city fare zone of St. Louis on a Sunday for 25 cents met quick appreciation from the public of St. Louis on the opening day, Jan. 15. Although the morning weather was raw and clammy enough to discourage early riding, 20,432 passes were sold. The pass cost equals 3.3 times the token fare of 7½ cents. Most of the sales were made to adults, inasmuch as the fare for children between five and twelve years of age is only 3 cents. Included in the favorable comment in the newspapers was the following piece, on the order of that used by Walt Mason, published in the *Post-Dispatch:*

WE SING THE SUNDAY PASS

The street cars run on Sunday, just the same as through the week, but we have no Sunday rush-hour when the traffic hits a peak. Forgotten then the office, the business that we keep, while some of us go riding and sundry others sleep. The solitary grandeur of the Sunday street car's past; for two bits we can ride about as long as Sundays last. When we weary of the riding and we close our heavy lids, the pass is still transferable to mamma and the kids. So, ho, the Sunday street car pass in merry roundelay; just give the man a quarter and he'll let you ride all day. Sing loud the Sunday street car pass in lilting, swinging ditty; we'll give the man a quarter and we'll ride about the city. Sing, ho, the Sunday street car pass in unrestrained, wild glee, we'll ride around the city till the shining hour of three. But when of riding round the town too suddenly we bore, why not let us view the country, say, for 30 cents or more?

The More You Ride the Cars the Better the Service Will Be

According to *Industrial News* of Lansing, Mich., there is talk of the city employing a transportation engineer to work with the Michigan Electric Railway and the city to study service and see that details of the agreement between the company are carried out in the interests of the citizens of Lansing.

The company now has a working agreement for three years with the city. The debt to the city is being paid at the rate of $2,500 a month. Each month the company must report its condition to the public utilities department including earnings and expenses. As the *News* sees it the question of greatest interest to the public is service. On this matter the commmentator said:

The car-riders have this matter in their own hands. In general the citizens of Lansing themselves determine the service.

The worst kickers on service are those people who ride the cars only when the snow is deep and they cannot drive their own cars, but they expect the street cars to go through without any trouble. When a storm such as was experienced a week ago strikes Lansing the railway works 24 hours a day to keep the tracks clear and the cars running on schedule. The more you ride the cars the better the service will be. Perhaps a transportation man could figure out a better way to give service.

Increase to Ten Cents in Cairo

Fare in Cairo, Ill., is to be raised from 7 cents to 10 cents under a new plan advanced by the Illinois Power & Light Corporation, which owns the city and interurban lines in that city. Under the new plan books of twenty tickets will be sold for $1.25, and a 3-cent fare for school children will continue. Hearing on the new rates was conducted recently before Judge George W. Pillow, assistant commissioner of the Illinois Commerce Commission. A. C. Hall, assistant general manager of the company, cited the automobile as the cause of the decrease in the number of passengers hauled by the street cars. The city lines carried 1,262,000 passengers in 1920 and only 515,000 in 1926.

Decorate Car in Gary for Public Guessing Contest

To arouse greater interest in street car service and as a stimulus to traffic the Gary Railways, Gary, Ind., recently announced a prize contest in which cash awards aggregating $100 would be made for the fifteen answers which most nearly approximate the exact number of passengers carried during the 30 days ended Feb. 12 by a single designated street care operated in the city. One of the company's new 52-passenger one-man, double-truck safety cars has been appropriately decorated for the contest, the sides and front and rear dashes of the car being painted white and labeled with the terms of the contest in bold letters. The car will be operated during the contest period.

The contest is open to everyone except employees and their families. Blank cards are available for "guesses" to be turned in to office.

The entry blanks also provide space for recommendations or suggestions as to how the service may be improved. The entrant need not fill out this space, however, if he does not wish.

The first prize of $35 and fourteen other awards of smaller amounts will be distributed at the close of the contest. Mayor Floyd Williams and other prominent citizens of Gary will act as judges.

Seattle Fund Plan Fails

The two most recent projects planned in the City Council of Seattle, Wash., to provide financial aid for the Seattle Municipal Railway—one for a loan to be made from the light department, and the other for submitting to the voters a proposed ordinance appropriating money from the general fund—have been killed in Council, in committee of the whole. This action also kills any immediate plan to return to the 5-cent fare basis, as proposed by Councilman Oliver T. Erickson, in his bill providing for invading the general tax levy to aid the Seattle Municipal Railway.

Councilman W. T. Campbell's measure provided for a loan of $400,000 from the city light funds to take care of operating expense while the railway is accumulating $1,100,000 to meet bond interest and principal due March 1.

Certain business groups urged the Council to postpone action until the business men's survey of the railway problem now under way is completed, and a comprehensive program for permanent relief recommended.

Meantime, employees of the Municipal Railway numbering about 2,000 received their last pay in interest-bearing warrants, stamped: "Not paid for lack of funds." Payroll checks of $128,329 were cashed by merchants.

A Free Hand for Detroit Department Heads

In the light of the purchase obligations and the rapid expansion of Detroit, the Department of Street Railways, Detroit, Mich., has performed well and creditably. This statement was made part of Mayor Lodge's first communication to the Common Council in which he mentioned various departments of city government. He further stated that the Street Railway Department was top heavy in several divisions with an excess of employees but that a notable start had already been made toward weeding out duplication of effort.

Service, not profit, in the Mayor's opinion, should guide the department's management in every operation and the better handling of "the thousands who daily use the street cars and buses, should be studied closely and their requirements met as quickly as possible."

He said that in co-operation with the Rapid Transit Commission, whose studies of future traffic and transportation needs must continue, and in conjunction with all other city departments having to do with Detroit's streets and highways, the Street Railway Department was to lead in the solution of present transit problems.

In his communication he pointed out that during the coming administration the head of each department would conduct its business without interference either from him or any person, official or unofficial, but that he would consult with the department heads from time to time.

Relief Plan for Susquehanna Trail Proposed

One track at least of the Valley Railways in Lemoyne, Pa., is on the public highway according to J. L. Shelley, Jr., the state highway department expert on contracts. The highway department has presented a plan for permanent relief of traffic congestion at the "bottleneck" which includes paving, removal of overhead bridge pillars and street car track relocation all the way from the river to Rossmoyne Street, Lemoyne, where the road to York joins Carlisle pike.

Four estimates on the cost of the project designed to relieve permanently the traffic congestion existing in what is termed "bottleneck" from the western end of the river bridges to Rossmoyne Street, Lemoyne, were prepared by P. M. Tebbs, an engineer for the State Highway Department. They vary from $106,504 to $168,299.

The undertaking involves under one of the plans, a new bridge carrying the low grade-line of the Pennsylvania at the entrance to the river bridge. It provides that the tracks be moved to the middle of the highway, with the necessary switches and connections with the carhouse and with the highway constructed of concrete forty feet wide.

This, an important section of highway, carries all the traffic of the Susquehanna Trail, plus the great volume that flows up and down the Cumberland Valley, the Gettysburg traffic and all this on top of the rapidly increasing local traffic between a city of Harrisburg's size and its populous suburbs on the west shore.

Trade of Unprofitable Detroit Lines to State Suggested

Fred W. Green, Governor of Michigan, has suggested to attorneys for the Detroit United Railway that rights-of-way of unprofitable lines be traded to the state for use for trunk-line highway purposes in return for all or part of the back taxes in excess of $800,000 due the state.

The report from Lansing, the state capital, cited that four of the lines of the Detroit United have paid no taxes since 1921 until this year, when payment of about $150,000 was made upon threat from the state to force a sale of some of the properties.

Schenectady Petition Must Be Heard

A motion made by the city of Schenectady, N. Y., for a dismissal of the petition of the Schenectady Railway to increase its fare to 10 cents cash has been denied by the Public Service Commission. Resumption of hearings before the commission on Feb. 1 was further ordered.

The city contended that certain franchises granted the company limit the rate of fare within the city to 5 cents and that the commission had no power to fix a fare in excess of 5 cents without a waiver of those restrictions by the city. But the commission held among other things that under the railroad law of the state the Legislature and the commission had the power to regulate fares on all lines operated under franchises which required compliance with the railroad law, and further it held to the opinion of the Court of Appeals in the Troy and Binghamton railway fare applications that earlier franchise conditions restricting rates of fare were waived by the granting of later franchises containing provisions on complying with the railroad law.

Prosperous Year for Salt Lake City Employees

A surplus of $9,919 has been divided among the members of the Traction and Power Mutual Aid Association composed of employees of the Utah Light & Traction Company and the Utah Power & Light Company, Salt Lake City, Utah. Nine hundred and fifty-nine members participated in the distribution.

Good Cheer Converted Into Good Will in Little Rock

During the Christmas holidays of 1927 the Arkansas Power & Light Company, Little Rock, Ark., placed a selective group of transportation, sales and service men at strategic points in the downtown area of the Arkansas capital. Regular uniformed men from the railway department were assigned to the task of assisting the Christmas shoppers in boarding the street cars in the more congested districts. While these men were equipped to sell tokens and make change their principal job was to carry bundles, assist aged and infirm persons and those with children. The duties were summed up under the blanket order, "Render any service feasible for the convenience of the street car patron."

The "Service Men" was an outgrowth of a "Service Boy" scheme worked out by the Arkansas Power & Light Company last November when the Arkansas Education Association held its annual convention at Little Rock. At that time 25 boys from the Little Rock Boys' Club were employed to act as guides, or pages for the visiting teachers. These "Service Boys" were stationed at the railway stations and important downtown intersections for the purpose of directing the visitors, carrying baggage or rendering any other service practicable for the convenience and pleasure of the delegates. So popular was this service that the company decided to extend the plan during the pre-Christmas season and started a more substantial service to the home people. With this in mind, men rather than boys were selected for the task.

A vast amount of good will resulted to the company in both cases. Local newspapers carried stories and printed pictures of the "Service Boys" and the "Service Men."

Is Poverty an Adequate Defense Against Reconstruction Work?

The Nebraska Supreme Court has been asked by the Nebraska Railway Commission to support it in its controversy with the Omaha & Southern Interurban Railway, Omaha, Neb., that the financial condition of the railway is not a sufficient defense for its refusal to obey an order that it reconstruct a bridge over its rails in Sarpy County, so that a highway may be carried across it. Because of its steep grades the highway had fallen into disuse since the automobile became so generally adopted, and when the bridge became unsafe for use the interurban company declined to rebuild it. The county commissioners filed a complaint and the reconstruction order of the State Railway Commission followed.

On its appeal the company challenges the authority of the commission to make such a condition in its order and also challenges its jurisdiction over railway crossings.

On the question of financial condition the commission states that the plea of prospective bankruptcy following obedience to an order requiring the expenditure of money cannot deprive it of its right to insist that necessary duties devolving upon the utility be performed. It contends that while intelligent self-interest will dictate that a regulatory body do not impose burdens upon the corporation such as will force it to cease service the question rests entirely with the state. It rules that the claim that the utility cannot afford the expense incurred by obeying an order is not available to it as a defense, so long as it has the alternative of withdrawing from business entirely.

Paving Relief Agitation Renewed in New York

Announcement has been made that at a meeting in Albany of the committee named by the Mayors' Conference with the committee named by the electric railways it was voted to request the state tax department to draw a paving relief bill satisfactory to both the cities and the companies.

Harry B. Weatherwax, vice-president of the United Traction Company, Albany, N. Y., member of the special railway committee, and William P. Capes, secretary of the New York State Conference of Mayors, will be the spokesman for the two special bodies. The committee of two will call on the state tax experts this week. When the tax department has prepared its bill, copies will be sent to the railway and cities of the state, with requests for prompt expressions of views.

At the Niagara Falls meeting, the New York Electric Railway Association asked the Mayors' Conference to name a special committee to confer with one from the association "in an endeavor to come to some agreement in this matter (paving between tracks) which will be satisfactory to all concerned."

Public Utility Course for Business Executives

A six weeks' summer course in public utility management and economics for business executives will be given from July 9 to Aug. 18 by the Harvard University Graduate School of Business Administration, Soldiers Field, Boston, Mass., under Philip Cabot, professor of public utility management, and D. W. Malott, instructor in this subject. The course will cover various legal, economic, engineering and financial phases of management and will include a study of court and commission decisions covering valuation, depreciation and fair return, besides cases from company practice in methods of marketing, rate-making, operation, finance, customer relations and the broad economic problems of production. The course will require the full time of the student, classes meeting for four hours daily. The case method will be followed throughout.

A similar course was given last summer with 35 public utility executives from all parts of the country in attendance, and the forthcoming course is the outcome of the success of the former. Miss M. B. Fox is secretary of the special session for business executives.

Lower Fare on Massachusetts Line

A reduction to $1 has been made in the round-trip bus fare between Worcester, Mass., and Webster by the Worcester Consolidated Street Railway. The round-trip fare has been $1.10 on both the Consolidated and the Acme lines. The reduction was made at the request of the Selectmen.

Dining Car Service on Milwaukee-Watertown Line

Dining car service was established on Jan. 16 on the interurban line of the Milwaukee Electric Railway & Light Company between Milwaukee and Watertown. The equipment for this service was built at the company's Cold Spring shops. Every kitchen operation from refrigeration to cooking is done electrically. Table d'hote and à la carte service will be provided on three westbound and three eastbound trips daily except Sunday.

The new dining car service will be tied in directly with the company's Madison buses at Watertown. The train itself is unusual. It is mounted on three special trucks designed for easy riding. The two coaches are joined by a passageway between the passenger and the dining cars. The train is 90 ft. long.

The leading coach is identical in finish with the de luxe coaches now operated on the rapid transit lines. It includes smoker and baggage compartments. The diner seats sixteen persons at a time. The tables are of steel and the chairs of aluminum frame, with spring seats and leather upholstery. The train is so arranged that additional passenger coaches may be attached and operated in multiple if the traffic should warrant.

Institutional Campaign Launched by American Water Works

A six months' institutional advertising campaign in magazines has been started by the American Water Works & Electric Company, controlling company of the Monongahela West Penn Public Service Company of West Virginia. The purpose of the campaign is to stress the various aspects of the service of subsidiary companies such as impartial rates to all consumers, stability of business and emergency services. It is hoped that the series will appeal to the consumer and the investing public.

$275,000 Pledged for San Francisco Line

A resolution pledging $275,000 for the completion of work on the Judah Street line of the Municipal Railway of San Francisco, Cal., has been adopted by the Board of Supervisors. The money will be included in the next budget of the board to pay for the construction if the city is enjoined from paying for the contracts out of the Municipal Railway funds. According to a press report the question now is: What will happen to the suit brought by "A Taxpayer" to prevent the use of Municipal Railway funds for Municipal Railway construction?

Judge Murasky in the Superior Court has already ruled in favor of the city's right to use Municipal Railway funds for Municipal Railway construction, and the city attorney is confident that this ruling will be sustained by the State Supreme Court.

Proposed Increased Wage Scale in St. Louis

Wage increases ranging from 5 to 10 cents an hour have been tentatively decided upon by the 4,500 union employees of the St. Louis Public Service Company, St. Louis, Mo., and will be presented shortly in the form of a proposed new wage scale and working agreement to company officials. A tentative draft of the new schedule met with the approval of the majority at a meeting of the car men held on Jan. 9.

The present wage scale of motorman and conductors ranges from 50 to 67 cents an hour. These workers would receive a raise of 5 cents an hour if the tentative scale is finally adopted. About 3,500 motormen and conductors are employed by the company. Including other workers, such as shopmen, mechanics and maintenance men, there are 50 classifications and each has a different wage scale.

Baltimore Studies Chicago Parking Law

The United Railways & Electric Company, Baltimore, has sent Dean J. Locke, assistant superintendent of the traffic department, to Chicago to make a study of the results of the new ordinance which prohibits parking in the Loop district. The situation in Chicago is said to be similar to that which exists in Baltimore and which the United is trying to improve. Mr. Locke also will study traffic conditions in other cities, including Pittsburgh, Cleveland and Detroit.

Utility Scholarships Announced by University of Illinois

Graduate scholarships and fellowships in the Economics of Public Utilities for the year 1928-1929 have been announced by the University of Illinois. They will consist of three fellowships of $800 each to third-year graduate students; five fellowships of $600 each to second-year graduate students and seven scholarships of $400 each to first-year graduate students. Eligible students must possess a bachelor's degree from a Class A college or university, must have demonstrated excellence in scholarship, and a proper foundation in economics. No application will be received after March 1. Awards will be announced on April 1, 1928. Further information can be obtained from Dean Charles M. Thompson, College of Commerce and Business Administration, University of Illinois, Urbana, Ill.

Bread and Street Car Tickets in Atlanta

Arrangements have been made by the Southern Grocery Stores, Inc., operators of the Rogers chain stores, whereby two wrappers from the popular loaf of bread, accompanied by a nickel, entitles the holder to a street car ticket good on the lines of the Georgia Power Company, Atlanta. Four wrappers and 10 cents will buy two tickets, and so on with the same ratio. It is stated by officers of the company that they have bought at the regular rate of 7½ cents each a large quantity of tickets and have distributed them to the various stores in and around Atlanta. The offer will continue indefinitely, it was stated.

Edward Dana Honored

At the annual meeting of the directors of the Massachusetts Safety Council, held during the week of Jan. 7, Edward Dana, general manager of the Boston Elevated Railway, Boston, Mass., was elected to the presidency. He succeeds Howard Coonley, retired after six years of service. Mr. Coonley remains on the board, and retains his full interest in the work of the council. His successor has served as vice-president of the organization.

Beeler Report Discussed in Cincinnati

The Public Utilities Committee of the City Council of Cincinnati, which consists of Tylor Field, chairman; C. O. Rose and Fred Schneller, met recently to consider a motion presented by Stanley Matthews, Vice-Mayor, and referred to the committee. As a result a motion was prepared which will be submitted to the Council and if passed will open the way for negotiations immediately with the Cincinnati Street Railway for the operation of the rapid transit system.

The new motion was prepared mainly because the committee had before it another motion presented by Mayor Seasongood several weeks ago, calling upon the City Manager to investigate and report on the Beeler report, and it was thought desirable to combine the two. The motion as prepared is as follows:

That the Public Utilities Committee be directed to confer with the Rapid Transit Commissioners, the Cincinnati Street Railway and the committees of semi-public bodies in regard to the Beeler report on the rapid transit system, and to report in three months the progress made, and that the City Manager is directed to assist the committee.

Mayor Seasongood contends that a subway in a city of less than 1,000,000 inhabitants will not be a paying proposition and also objects to the completion of the system on the ground that it will in fact benefit outlying municipalities to a greater extent than it will Cincinnati but with Cincinnati paying the entire cost.

Other Councilmen, chiefly Mr. Matthews and Mr. Rose, say that it is too late to bring up the objection of benefiting outlying communities. They contend that more than $6,000,000 has already been spent and that it is only logical under the circumstances to proceed and finish the job.

Unusual Strike in Pennsylvania

Emergency bus operations in the territory of Pottsville, Pa., and its vicinity has been in force since Jan. 6 when employees of the East Penn Electric Company walked out as the result of the inability of the company and the men to agree on the inclusion of the word "subsidiary" in the new contract.

When the agreement with the union expired on Dec. 31, 1927, a similar contract was offered to the men without any change. It was agreed to by them with the exception that they demanded the word "subsidiary" be placed in the preamble of the contract, and a bus clause embodied in the contract which would cover any future bus operation. It is said by some that the men have the idea that the railway proposes to abandon some of the lines and replace the service with bus operation. This viewpoint has been termed erroneous by company officials who have tried to make it clear to the men. They in turn insist on a bus clause and the word "subsidiary" being inserted in the preamble.

Meanwhile the Pennsylvania Public Service Commission through its representative, Harvey Rose, has placed buses throughout the territory with men in charge who are holders of certificates in different localities in and about Schulykill County. The public, apparently unaffected by the strike, is riding the buses and from all reports is much in favor of the company's refusal to enter into any such contract with the men.

Parking in St. Louis Under Scrutiny

An ordinance to eliminate daytime parking except for commercial vehicles in the downtown section of St. Louis, Mo., has been prepared by Director of Streets and Sewers Brooks. The bill will also provide more drastic regulatory parking measures for a larger district surrounding the downtown congested sections.

Foreign News

Bus and Tramway Co-ordination in Scotland

Greenock and Port Glasgow Tramway, Glasgow, Scotland, has withdrawn its tramway services on Sundays and after 9 p.m. on weekdays. The company operates buses in addition to the tramcars. It is believed that buses alone will be able to handle traffic during the hours when the tramcars are withdrawn.

Sydney Trams Show Passenger Increase

Passenger revenues of the tramway system of Sydney, New South Wales, increased during the year ended June 30, 1927, from £2,900,406 in 1926 to £3,030,973 in 1927. Operating expenses were £2,480,587 in 1926 and £2,627,045 in 1927, giving net earnings in 1926 of £419,819 and in 1927 £403,928. The greater part of the increase in expenses is due to higher wages, combined with the shortening of the hours of duty from 48 to 44 per week. During the past year, the operating cost per car-mile was 23.83d. (47.66 cents). The book investment is £8,110,571, so that the net earnings show a return on the capital of 5.03 per cent.

The number of passenger fares collected during the year numbered 279,671,372, an increase of 6,167,489 over the previous year. The rolling stock was increased by 25 cars. The total number of electric cars on June 30, 1927, was 1,541 motor cars and four trailers. The lines are owned and operated by the New South Wales government, which also owns and operates the trunk line railways in New South Wales and the new subway system in Sydney.

Rapid Rise of Barcelona System—Consolidation Ahead

Barcelona's urban transportation has undergone a radical transformation during the last ten years, according to a report to the Department of Commerce from Trade Commissioner James G. Burke, Barcelona. In 1917, with tram lines alone, the income from fares collected in this Spanish city was only 14,000,000 pesetas. At the present time there exist not only tramways but also two subway systems and a bus company. The total income from these three in 1924 amounted to nearly 35,000,000 pesetas, and the total capital invested is now some 107,400,000 pesetas. This increase has been due to the growth in population and traffic, the movement of the inhabitants from the central part of the city to its outskirts, and increased competition resulting in lowering fares and offering better and more frequent services.

A group of local bankers is carrying on a campaign to combine all subway, tram and bus companies. It is offering the recent combination effected in various European and American cities as an example and is publishing statistics to prove that both better service to the public and municipal economy would be the result.

Tramways Discontinued in Lincoln

Buses will replace tramways in the town of Lincoln, England, because of a continuous falling off in receipts for the last few years, according to a recent announcement. Track construction now necessary would cost £30,000.

Electrification Scheme for Wales

The Swansea & Mumbles Railway, Wales, will soon be electrified at a cost of $750,000, according to a recent report. The British Electric Traction Company is to provide $425,000 of this sum.

The line is at present held by the Swansea Improvements & Tramway Company, a subsidiary of the traction company, and the lease is to be transferred to the South Wales Transport Company, another subsidiary. The main supply of current will be at the Swansea end of the line, but a transformer substation will be constructed at Blackhill. Each of the cars proposed for use on the line will carry 110 persons and cost £4,000 ($20,000). The equipment will be overhead and a 7½-minute service is to be provided.

Recent Bus Developments

Last Independent Purchased in Akron

The last independent bus company in Akron, Ohio, the Zeno Transportation Company, has been purchased by Northern Ohio Power & Light Company, and the latter company assumed full control on Jan. 9. The line will continue to operate for 30 days under the present name and will remain an independent company for the time being.

The Zeno Company operated in Akron for seven years. It provided service on South, Sumner, Johnston, Inman and McGraw Streets and operated special buses morning and evening to and from the Goodrich and the Goodyear plants.

Following approval of the City Council, the line will be made a part of the transportation system in Akron with the issuance of transfers between this line and other lines.

The Zenos' had eleven buses, a garage and a filling station. The railway takes over all of this property.

Railway and Bus Men in Oklahoma Co-operate

The Oklahoma Railway, Oklahoma City, Okla., has submitted a proposal to state bus operators for issuance of through tickets on combined interurban, electric and independent bus lines.

P.R.T. Plans More Purchases —Further Ban on Cruising

The Philadelphia Rapid Transit Company, Philadelphia, Pa., applied to the Public Service Commission Jan. 19 for the purchase of the Quaker Cab Company, the only large operator of taxicabs in the city which is not under the control of Mitten Management, Inc. This move follows an announcement made on Jan. 6 by Ralph T. Senter, president of the company, in a letter to Mayor Mackey outlining the policy for 1928. He said that the purchase would make possible the standardization of all taxicab rates in Philadelphia and eliminate duplicate service.

It also sought authorization for acquiring the Montgomery Bus Company, the Doylestown-Easton Motor Company and the Philadelphia Suburban Transit Company. The company's program was defined as contemplating "more unified and efficient transit service in Philadelphia's suburbs."

In connection with cab cruising, night as well as day restrictions to taxi stands was ordered on Jan. 8 by Superintendent of Police Mills of Philadelphia, Pa. The "no cruising" edict against taxicabs was designed to reduce still further the number of empty cabs in the congested section and to increase the service rendered by taxicab companies to the public. It is a revision of the former taxicab rule, as a result of an intensive investigation of traffic congestion made by the Department of Public Safety.

In the area from Walnut to Arch Streets and the Delaware River to Eighteenth Street inclusive, cabs will be permitted to move from one stand to another as traffic demands, except from 8 a.m. to 6 p.m. when empty cabs will not be permitted to pass an empty stand without orders from a dispatcher or supervisor. The former edict on taxicab cruising in Philadelphia was referred to previously in ELECTRIC RAILWAY JOURNAL.

New Bus Service Installed in Kansas City

A system of part-time bus service on East 43d Street was recently installed by the Kansas City Public Service Company, following a meeting of Fred Buffe, vice-president of the company, and the members of the Southeast Improvement Association, which has repeatedly petitioned the company for bus service at this point. An agreement calls for bus service on week days from 6 a.m. to 9:30 a.m. and from 4 p.m. until 7:30 p.m. Saturday night and Sunday night service also will be arranged, Mr. Buffe announced. Officials of the company estimate that 95 per cent of the patrons of the district will be accommodated by the new arrangement. The buses operate at fifteen-minute intervals.

Richmond-Seven Pines Line Denied Permit

Application of the Sandston Railway for authority to operate bus service between Richmond and Seven Pines, Va., via Williamsburg Road, has been dismissed by the Virginia Corporation Commission "without prejudice" by request of the petitioner. Opposition was voiced by the Virginia Electric & Power Company and the Peninsula Transit Corporation. A similar petition was filed by the Sandston Railway about a year ago, but was finally withdrawn.

Regulation for Interstate Carriers

Examiner Flynn presents report on I. C. C. inquiry. The findings and conclusions of his report, however, are merely tentative. Exceptions must be recorded by Feb. 7

FEDERAL regulation of all common carrier motor vehicles operating in interstate or foreign commerce over the public highways was recommended on Jan. 16 by Leo J. Flynn, attorney-examiner for the Interstate Commerce Commission, in a report to the commission based upon an investigation of bus and truck operation throughout the country.

The report covers every phase of motor transportation. It will be argued before the commission on Feb. 10. It recommends that all steam and electric lines now subject to the Interstate Commerce act be authorized by law to engage in motor vehicle service, directly or through subsidiaries, upon obtaining a certificate of convenience and necessity; also that independent motor companies operating in interstate commerce be subject to regulation. Mr. Flynn held that so-called contract carriers "are not sufficiently standardized to make the regulation of such operations in interstate commerce advisable at this time."

The regulation proposed in the report, however, would not include motor vehicles operated by the owners incidentally to the conduct of their business.

It is believed that the record warrants the following conclusions:

1. Transportation of passengers and property by motor vehicles operating over the public highways is a well-established, useful and permanent factor in the nation's transportation system.

2. Steam railroads and electric railways are engaging more and more extensively, either directly or through subsidiaries, in motor vehicle transportation as supplementary to their rail operations to replace train operations, or as feeders or distributing agencies.

3. Carriers now subject to the act should be authorized by law to engage in motor vehicle service over the public highways, directly or through subsidiaries, upon obtaining a certificate of convenience and necessity as provided in such law.

4. The revenues, expenses, and investments and other statistics incident to motor vehicle operations by carriers now subject to the act, either directly or through subsidiaries, should be required to be regularly reported to the Commission and be declared by law as coming within the provisions of section 15a of the interstate commerce act in determining net railway operating income under the provisions of that act.

5. A more detailed classification of accounts adapted to the peculiar problems arising from motor carrier operations by carriers subject to the interstate commerce act, directly or through subsidiaries, should be adopted.

6. Carriers subject to the interstate commerce act and their motor carrier operations should be authorized by law to participate in joint rates and through routes with common carrier motor bus and motor truck lines holding certificates of convenience and necessity from some regulatory body in substantially the same manner as they are now authorized to do with carriers now subject to the act.

7. The problem of regulating motor vehicle operations in interstate commerce is a comparatively new one, and it is too early to attempt regulation by a rigid law. It seems wise, however, to lay down a few

Digitized by Google

principles governing such operations at this time.

8. The law should provide for the regulation of interstate commerce by motor vehicles operated as common carriers of passengers and property over public highways.

9. Regulation should not include motor vehicles operated by the owners incidentally to the conduct of their business.

10. The motor vehicle operations of so-called "contract carriers" are not sufficiently standardized to make the regulation of such operations in interstate commerce advisable at this time.

11. Motor carriers operating in interstate commerce as common carriers should be classified: (1) Those operating between fixed termini or over a regular route; (2) all other common carriers.

12. Original jurisdiction in the administration of regulation over motor vehicles operating in interstate or foreign commerce as common carriers over the public highways should be vested in such state regulatory bodies as notify the Interstate Commerce Commission that they will act. The Interstate Commerce Commission should be delegated to act with original jurisdiction whenever a State board fails to notify the commission of its acceptance of the delegation of authority to act under the federal statute, and until such notice is received. Joint boards composed of two or more state boards, or representatives of such State boards and of the Interstate Commerce Commission, when acting for a state board, should be authorized to act where the commerce is carried on in two or more states.

Right of Appeal Reserved

13. The right of any party to appeal from the action of a state board or a joint board to the Interstate Commerce Commission should be preserved.

14. Legislation for the regulation of motor vehicles operating as common carriers over the public highways should provide as prerequisites to operation: (1) Certificate of convenience and necessity; (2) liability insurance or indemnity bond or satisfactory assurance of financial responsibility which will insure adequate protection for the responsibility assumed in the transportation of passengers or property.

15. The law should provide that in determining whether or not public convenience and necessity require the granting of a certificate to operate, reasonable consideration, among other pertinent matters, should be given to available transportation service by any other existing transportation agency operating in the same territory, and to the effect which the proposed service may have upon any such existing transportation agency, the continued operation of which is important to the community served by it.

16. The law should provide that the fact that an applicant for a certificate of convenience and necessity was in bona fide operation on March 2, 1925, and continuously since then and at the time application is made shall be considered prima facie evidence as to the convenience and necessity of such operation.

17. Transfer of certificate of convenience and necessity should be permitted with the approval of the issuing board. Revocation of a certificate should only be permitted under circumstances of compelling public necessity.

18. As a condition to the exercise of rights granted with a certificate of convenience and necessity, the holder of the same should be required to undertake to furnish such additional service as the needs of the public might demand in the future.

19. The law should require that rates be just, reasonable, not unjustly discriminatory, and not unduly preferential or unduly prejudicial.

20. Provision should be made for the filing of complaints against rates, practices, or service of motor vehicles operating in interstate commerce over the public highways. The procedure upon hearing of such complaints should be substantially the same as the procedure at hearings upon complaints against steam railroads or electric railways.

Wide Discretion Urged for Regulatory Boards

21. The regulatory boards should be vested with wide discretion in the administration of the law, particularly with respect to rates, fares, and charges, accounting and filing reports; and in the making of rules and regulations for the regulation of motor vehicle operations and service.

22. Broad discretionary powers should be given to the regulatory boards in the matter of exempting interstate motor vehicle operations from any of the provisions of the law if such exemption would be in the public interest, as in the case of small operators who are giving transportation service important to the communities served, but who might be unable to continue operations if required to comply with all regulatory provisions on account of the additional expense involved.

23. Brokerage in transportation of passengers for hire in interstate commerce by motor vehicles operated by a person or company not holding a certificate of convenience and necessity from a regulatory body covering such service should be prohibited.

24. The issuance, interchange, or exchange of free passes and free transportation by common carrier, motor carriers operating over the public highways in interstate commerce should be prohibited, except in substantially the same manner and to the same extent as provided for in the case of common carriers now subject to the interstate commerce act.

25. Federal legislation for the regulation of commerce by motor vehicles should include the transportation of passengers or property to or from a foreign country, but only so far as such transportation takes place within the United States, in substantially the same manner and to the same extent as interstate commerce.

26. The transportation of explosives and inflammables by motor vehicles in interstate or foreign commerce is prohibited by the transportation of explosives act, except and in the manner provided therein.

27. The provisions of the bills of lading act are applicable to motor carriers operating in interstate or foreign commerce.

28. The provisions of the Clayton anti-trust act relating to the business and transactions of common carriers are applicable to the business and transactions of motor carriers operating as common carriers in interstate or foreign commerce.

29. Public policy demands the fostering and preserving in full vigor motor vehicle transportation as well as rail and water transportation. Section 500 of transportation act, 1920, should be amended to include motor vehicle transportation in the declaration of policy there made.

There should be a wise, farsighted, and definite co-ordination of all existing transportation agencies—land, water, and air.

The report is a document of 105 mimeographed sheets.

The commission's authority for making the investigation is based upon provisions of the interstate commerce act: (1) The commission has authority to investigate the manner in which common carriers subject to its jurisdiction are doing business, and (2) the commission is authorized, and in fact is directed, to make such recommendations annually to Congress on matters pertaining to the regulation of interstate commerce as it may deem necessary.

Reasons for the Investigation

Prior to March 2, 1926, state regulatory bodies generally had assumed, in the absence of any federal legislation on the subject, regulatory control over the operations of motor buses and motor trucks engaged in interstate commerce and interstate operators were required to conform to the laws and regulations of the states in or through which they operated. On that date the Supreme Court of the United States handed down decisions holding that state regulatory bodies could not restrict the operation of buses or trucks engaged in interstate commerce where such regulation was not primarily with a view to safety or to conservation of highways. Buck vs. Kuykendall, 267 U. S. 307; Bush Co. vs. Maloy, 267 U. S. 317. No regulation has been exercised over interstate commerce by buses or trucks not used in terminal service in connection with rail transportation since these decisions were rendered. Several bills providing for the regulation of interstate commerce by buses and trucks operating as common carriers on public highways were introduced at the 69th session of Congress.

Steam railroads and electric railways had entered into the field of motor transportation either directly or through subsidiaries as supplementary to their rail operations; a number of railroads had filed applications with the commission for permission to abandon portions of their lines, alleging as one of the reasons, loss of passenger or freight revenues by reason of motor bus or motor truck competition. The legality and propriety of arrangements under which motor buses or trucks are operated by, or in connection with carriers subject to the interstate commerce act had arisen in formal cases before the Commission and otherwise. Informal complaints had been received from passengers who had engaged transportation for interstate travel by motor vehicle from irresponsible operators who failed to carry out their contracts.

Considering these matters, as well as the rapidly increasing importance of motor transport, the commission on June 15, 1926, entered upon an investigation on its own motion into and concerning the general question of the operation of buses and trucks by, or in connection or competition with, common carriers subject to the interstate commerce act. The scope of the investigation included the legality and propriety of the arrangements under which motor buses and trucks are operated by, or in connection or in competition with carriers subject to the act; the rates, fares, and charges for such services, and the provisions for filing schedules thereof

Digitized by Google

and the extent to which the traffic and the revenues of the carriers subject to the act are affected by the operation of buses and trucks.

Some Facts About the Electric Railways

Of 260 electric railways subject to the interstate commerce act 118 reported in response to the questionnaire. They operated 401 buses in terminal service and 351 buses in line service with a total bus route mileage in line service of 2,972 miles. Through subsidiaries they operated 190 buses in terminal service and 422 buses in line service over a total line bus route mileage of 2,857 miles. The electric carriers reported that 78 buses were operated by others than themselves or their subsidiaries in terminal service and 315 were operated by others in line service over a bus route mileage of 1,816 miles. With respect to motor buses operated by others in competition with their rail service the electric carriers reported 1,215 vehicles so operated with a total line bus route mileage of 10,280 miles.

The replies of the electric railways indicate that the majority of the buses operated by them or by their subsidiaries were engaged in line or terminal service in competition with their own operations.

The electric railways reporting operate eight motor trucks in line service over a truck route mileage of 192 miles and 22 trucks in terminal service. In connection with these railways 65 motor trucks were operated by others in line service over a truck route mileage of 829 miles and 27 trucks in terminal service. There were 2,329 motor trucks operated by others in competition over a route mileage of 18,795 miles.

Fewer Electric Railways Report to Commission

In 1921 the number of electric railways reporting to the commission was 312. The number decreased each year until in 1926 it was 259. During the same period the railway operating revenues of the electric railways reporting to the commission decreased from $235,656,072 to $194,860,000, or 17.31 per cent, and railway operating expenses decreased from $189,450,749 to $163,210,222, or 13.85 per cent. The passenger revenue decreased from $193,166,389 to $140,536,857, or 27.25 per cent. It is interesting to note, however, that there was a steady increase in freight revenue during the same period. It was $28,585,712 in 1921 and $39,794,714 in 1926, an increase of 39.21 per cent.

The total revenue passengers decreased from 2,099,721,398 in 1921 to 1,351,235,957 in 1926, or 35.6 per cent; passenger car-miles decreased from 443,013,948 to 373,857,483, or 15.61 per cent.

A number of large electric systems which reported to the commission in 1921 were relieved from doing so in 1926 because of the insignificant amount of their interstate business. On the other hand, a number of large systems which filed no reports in 1921 did file reports in 1926.

Financial *and* Corporate

Interest to Be Paid by Chicago City Railway

Payment of the semi-annual interest on the first mortgage 5 per cent bonds of the Chicago City Railway and of the Calumet & South Chicago Railway, the south side operating organizations of the Chicago Surface Lines, will be made when it falls due on Feb. 1, according to Frank O. Wetmore, chairman of the bondholders' protective committee. It is expected that semi-annual interest on the first mortgage bonds of the Chicago Railways Company, which operates the north and west side street car lines under a federal receivership, will be ordered paid on Feb. 1 by Judge James H. Wilkerson in the United States District Court, following similar action taken by the court six months ago.

Revaluation Question Up in Tacoma

At the request of the City Council of Tacoma, Wash., Manager Richard T. Sullivan of the Tacoma Railway & Power Company will sound out the stockholders and bondholders of his company on whether they would agree to requesting a revaluation by the state public works department of the company's properties at $3,000,000, for rate-making purposes, with the understanding that the new valuation would be a consideration for the drafting of a new franchise. The agreement was reached at a recent session with the City Council. This request of the Council means that no attempt will be made to submit a new franchise to the voters at the coming city election, as there is no possibility of the negotiations getting anywhere near finality for weeks or months.

The figure of $3,000,000 as a valuation of the properties of the railway, and of the Pacific Traction Company, is an arbitrary one, to represent roughly what the report of Kenneth G. Harlan indicated would be a reasonable valuation of properties as they stand today. Mayor Tennant made the motion to request the company to determine the acceptability of such a figure.

The value now recognized by the state department of public works for rate-making is in excess of $6,700,000, so that the proposed figure is a huge reduction. Manager Sullivan protested that it would put him in an embarrassing position to go to his people with a request for a valuation less than the $3,500,000 Mr. Harlan suggested as a basis for city purchase. Mr. Harlan replied that his figure had been taken merely as a basis upon which computations might be made, after reducing the company's annual operating expenses by $300,000, hence in the present inquiry, the $3,500,000 figure did not apply.

Mayor Melvin G. Tennant took the lead in directing the negotiations towards determining a new valuation. His stand was that, while the agreement between the company and city for an experimental period of operations had avoided the valuation question, when it came to submitting a new franchise, the people would want to know where the valuation matter stood, and that the state was not in a position at any minute to upset the terms of the franchise on the basis of the $6,700,000 valuation.

New Jersey Board Approves Transfer of Stock

The Board of Public Utility Commissioners of New Jersey on Jan. 14 approved the transfer of all outstanding capital stock of the South Orange & Maplewood Traction Company to the Public Service Corporation of New Jersey. In July, 1901, the South Orange & Maplewood Traction Company absorbed the South Orange & Maplewood Street Railway. The property is leased in perpetuity from Oct. 1, 1903, to the North Jersey Street Railway, now included in the system of the Public Service Railway.

Port Arthur Property Bought by Eastern Texas

At the public auction of the Port Arthur Traction Company, Port Arthur, Tex., the property was purchased by the Eastern Texas Electric Company for $150,000. The sale was ordered by the United States District Court to satisfy creditors holding $324,000 in mortgage notes against the company. The creditors petitioned for the sale through the Dayton Trust & Savings Company, Dayton, Ohio.

J. G. Holtzclaw, general manager of the Eastern Texas Electric Company, announced that it is the plan of his firm to replace the rolling stock on the Port Arthur lines with new cars and to replace much old trackage with new rails. The Eastern Texas Electric Company operates the railway of Beaumont and the Beaumont-Port Arthur interurban line.

Erie Said to Be After Niagara High-Speed Line

Negotiations are reported to be under way for the sale of the Buffalo-Niagara Falls high-speed and the Buffalo, Lockport and Olcott interurban divisions of the International Railway, Buffalo, to the Erie Railroad. The Buffalo-Niagara Falls electric line would give the Erie Railroad a double-track system into

Digitized by Google

Niagara Falls with property along the right-of-way sufficient for adding two more tracks. The Lockport and Olcott interurban division is said to be wanted by the Erie Railroad for the access it would give to the Niagara County fruit belt.

The Buffalo-Niagara Falls high-speed line is one of the most highly developed electric interurban systems in the country. The route covers a distance of 23 miles. The right-of-way from the Buffalo city line is a 66-ft. strip.

Receivers of Oklahoma Railway Discharged

The receivership of the Oklahoma Railway, Oklahoma City, Okla., was officially ended on Jan. 5 by an order issued by John H. Cotteral, federal district judge. The report of George A. Henshaw and G. T. Lackey, receivers, was accepted without protest. The final act was the issuance of an order discharging them and releasing them from bonds.

$2,578,296 Budget Submitted in Kansas City

Dr. P. H. Saunders of Newman, Saunders & Company, fiscal advisers to the Kansas City Public Service Company, arrived in Kansas City recently to become a member of the budget committee of the railway. Dr. Saunders came from New Orleans.

The budget of $2,578,296 for the completion of the rehabilitation program of 1928 was submitted to Dr. Saunders and his associate members, Powell C. Groner, president of the company, and Col. E. M. Stayton, city representative.

The budget includes $1,018,180 for overhauling and rebuilding street cars, $933,228 for new tracks and $240,58S for special track work at intersections. The committee will report to the directors of the company at a meeting to be held within a few days.

The franchise promised a rehabilitation program of $6,600,000 to be finished within three years. The expenditures last year were on a scale of more than $3,000,000.

Bad Year for Detroit Municipal Railway

Gross revenues fell off $2,000,000 due to industrial depression. Figures of consulting auditor vary $1,312,858 from city statement. Charges to capital differ

FOR the fiscal year ended June 30, 1927, the gross revenues of the Detroit Municipal Railway, Detroit, Mich., fell off more than $2,000,000. Such is the condition revealed in the annual audit released on Jan. 8 by Price, Waterhouse & Company.

The audit differs from some features of the bookkeeping of the Department of Street Railways, but points out that the net revenue derived from operation during the past fiscal year totaled $1,912,898. Due to the dissimilarity of methods used in compiling the audit, there is a difference of $1,312,858 between the figures presented by the auditing firm and those announced by William M. Hauser, auditor for the Department of Street Railways.

Due to unemployment in the early part of 1927, there was a falling off in the number of passengers using the cars and buses. This falling off was greater during the period following July 1, and is not reflected in the audit completed by the independent firm. The audit suggests numerous changes in the methods by Mr. Hauser in keeping D.S.R. accounts, and as his method differs materially from that followed by the auditing company, the figures of the two audits fail to agree in any but a few particulars.

While the net earnings of the system are listed at $1,912,898, the audit contends that the sinking fund requirements for the year reached $2,600,227. This latter figure exceeds the earnings by $687,329, which is compared with a deficiency of $274,656 for the preceding fiscal year. Mr. Hauser's report shows net earnings as in excess of $3,000,000, which would leave an excellent surplus after sinking fund charges had been met.

The discrepancy between the two figures relates largely to depreciation charges, and the question of what is a capital asset. Investments made by the system as capital investments are considered by Price, Waterhouse & Company as properly chargeable to operation expenses. In other instances the depreciation allowed for buses and street cars is not considered sufficient.

In view of conditions in the city during the past year, Del A. Smith, general manager of the system, believes that the department emerged in excellent condition. The independent auditors' report does not take into consideration more than $500,000 obtained from sale of property in Highland Park, and this sum, with other funds, will be sufficient to meet sinking fund charges, Mr. Smith maintains. The report says:

As a result of our examination, and after taking into account certain adjustments to correct the book figures, including a charge of $1,172,924 in respect to depreciation and accruing renewals of the properties exclusive of motor coaches and an additional charge of $113,503, in respect of depreciation of motor coaches, we find that the operations for the year ended June 30, 1927, resulted in net income of $1,912,896, compared with net income for the year ended June 30, 1926, of $2,274,165, a decrease of $361,266.

Sinking fund requirements for the year, viz., $2,600,227, exceeded the net income available therefor by $687,329, as compared with a corresponding deficiency for the year ended June 30, 1926, of $274,656. No appropriation was made from net income for the year ended June 30, 1927, to provide for future repairs and renewals corresponding to the appropriation made from net income for the year ended June 30, 1926, in the amount of $179,283.

The net income for the year ended June 30, 1927, as set forth in the preceding paragraph, viz., $1,912,898, is subject to adjustment, due to the fact a number of items have been charged as capital expenditures which, in our opinion, and in accordance with the accounting regulations promulgated by the Interstate Commerce Commission, should in part at least be charged to operating expenses.

The audit then proceeds to itemize expenditures totaling $879,455 which the public accountants believe should in part be applied to operation costs. The independent auditors say they are not qualified to distinguish these items as representative of renewals, replacements or repairs, but that if so apportioned and charges made to operation rather than to capital expenditures, then the net revenue would be materially reduced. Extraordinary maintenance jobs cost $545,262.

Gross revenue derived from operation of the system during the fiscal year aggregated $24,298,054, from which must be deducted operation expenses of $18,379,659, leaving a net income from operation of $5,918,394. Taxes paid upon the system totaled $747,327. After interest and sinking fund charges, depreciation, etc., have been considered the net revenue total was $1,912,898.

The net revenue claimed by Mr. Hauser in his report was $3,214,183, leaving a difference between the two accounting reports of $1,301,284. This latter figure is accounted for as follows by the Price, Waterhouse & Company auditors; depreciation of road and equipment exclusive of motor coaches not provided for in the accounts of the department, $1,172,924; depreciation on one group of motor coaches not provided for, $110,235. The two figures total $1,312,858, after deducting $11,573 in respect to correction of distribution of income and expenses as between years.

Foreclosure Suit Brought Against Northern Indiana Line

Foreclosure proceedings against the Chicago, South Bend & Northern Indiana Railway were filed on Jan. 8 in the United States District Court at South Bend by the Central Trust Company, New York.

The foreclosure action was brought by the Central Trust Company as trustee for mortgages aggregating $3,000,000, issued to secure the railway's bonds. The company operates electric interurban lines connecting South Bend, Elkhart and Goshen, South Bend, La Porte and Michigan City, and South Bend, Niles and St. Joseph, Mich., in addition to city service in South Bend and Elkhart and co-ordinated bus service over certain parts of the system.

The line has been in the hands of Raymond R. Smith, former vice-president and general manager, as receiver since last fall.

Personal Items

A. LeRoy Hodges Promoted

Brooklyn City Railroad official made assistant general manager of 230-mile property he has served since 1919

A. LEROY HODGES was appointed assistant general manager of the Brooklyn City Railroad, Brooklyn, N.Y., on Jan. 10. Mr. Hodges has been connected with the Brooklyn City property since the termination of its lease to the Brooklyn Rapid Transit Company in October, 1919, by order of the federal court, at the instance of which the Brooklyn City was returned to its owners for operation.

Along with Clinton E. Morgan, vice-president and general manager of the Brooklyn City Railroad, Roy Hodges,

A. LeRoy Hodges

as he is best known, has carried a large part of the load incident to the rehabilitation and restoration of the Brooklyn property, a system of 230 miles of lines with more than 1,300 cars operating in a territory which while it has the inspiration killing designation of borough contains almost as many people as Chicago. The lease of the road had run since 1893, so that in addition to the complications of physical rehabilitation with its program for the modernization of the entire rolling stock there was the separation of the personnel and the severance of activities carried on for years for all the Brooklyn roads as a unit. So literally has the court order been followed that at the present time only certain phases of legal work of the Brooklyn City Railroad and the Brooklyn-Manhattan Transit Corporation, the successor to the Brooklyn Rapid Transit Company under reorganization, are handled jointly.

Now this may seem to have little to do with Mr. Hodges and his career, but that is not the fact. It furnishes the background indicative of the task involved in the separation of the systems, in which he has been a factor from the first. To the part that he has played in the work done in Brooklyn Mr. Hodges brought a wealth of experience both in railway work and in the field of general business. His first railway connection was with the Westchester, Kennett & Wilmington Railway, Kennett Square, Pa., as secretary to the general manager. He left this property in 1908 to enter the employ of the General Electric Company in Schenectady as secretary to the assistant general manager of the switchboard department.

In 1911 Mr. Hodges left Schenectady to become secretary to A. W. McLimont, then vice-president and general manager of the Michigan United Railways, Jackson, Michigan. When this property was leased to the Commonwealth Power, Railway & Light Company in 1912 he was appointed chief clerk to C. E. Morgan, general superintendent of the Michigan Railway, and continued in that capacity, both in Jackson and Grand Rapids, Mich., until he went with the Brooklyn City Railroad in October, 1919.

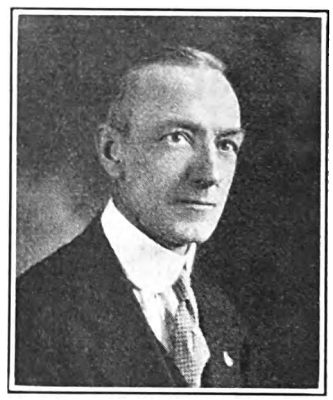
Mr. Hodges is a director of the Brooklyn City Railroad, is first vice-president of the Metropolitan Section of the American Electric Railway Association, and is a member of the Brooklyn Chamber of Commerce and the Kiwanis Club. Of his many accomplishments in the metropolitan district not the least by any means is the work which he has done in behalf of the local section of the American Association. Many men have contributed to make this body a success, but few if any of them have had a bigger part in this work than he or have worked more wholeheartedly in the section's interest. And all the while that he has contributed so unstintingly of his time and energy to this work Mr. Hodges has of course been engrossed in the exacting tasks which have just culminated in his promotion to the office of assistant general manager at Brooklyn.

JOHN F. SCHMUNK, C.P.A., formerly vice-president Mitten Management, in charge of accounting, announces the reopening of his Philadelphia office at 700 Cunard Building, 220 South Sixteenth Street, for the public practice of accounting. For a number of years Mr. Schmunk was senior accountant of the Pennsylvania Public Service Commission, later in public practice with offices both in Harrisburg and Philadelphia. He has practiced before state commissions in some of the most important valuation and rate cases involving public utilities in the states of Pennsylvania and New York. As a member of the subcommittee on bus accounting of the American Electric Railway Accountants' Association he participated in the preparation of the accounting classification for motor carriers promulgated recently by the Pennsylvania Public Service Commission.

J. C. Desautels Promoted in Montreal

J. C. Desautels has been appointed chief claims agent of the Montreal Tramways, Montreal, Que., Canada, effective Jan. 1, 1928. He would appear to be the right man in the right place in the light of his experience in this particular field. Early in his career he served as investigator in the claims department at Montreal and in February, 1926, was promoted to the position of assistant claims agent. During June, 1927, he was acting claims agent.

After completing a scientific and business course, the first position he occupied with the then Montreal Street Railway was as stenographer and office clerk, during the latter part of 1901. He was promoted to the position of clerk and dispatcher for the Cote Division in 1902. During that period he started a private four-year course along lines which would benefit him in his new position. A short time later he



J. C. Desautels

was transferred to a larger division, St. Henry, and held it until 1910. During that time, in company with another employee he devised and composed the street guide for the use of platform men, which guide is still in use. In June of that year he accepted a position of investigator in the claims department. In October, 1922, Mr. Desautels replaced A. J. Gadoua, the latter having been appointed superintendent.

L. J. Harris Assistant to Treasurer at Atlanta

L. J. Harris will become assistant to the treasurer of the Georgia Power Company, Atlanta, Ga. Mr. Harris has been district office manager in the sales department.

During 25 years of service with the company, Mr. Harris has filled many posts of importance. He started as bookkeeper in the railway department when he joined the company in 1902. In 1906, he was made assistant cashier of the company, which post he retained for six years. His next advancement came when he joined the district sales office in 1917 as field representative for

Digitized by Google

the general sales manager. Subsequently he became manager of the same department and remained in that position until his recent promotion to assistant to the treasurer.

Mr. Harris was educated in Atlanta schools and at Georgia School of Technology. Before he became connected with the local railway he was employed by the Fourth National Bank.

Mr. Harris will be succeeded in the position of district office manager of the sales department by J. M. Billing, who was secretary and treasurer of the Athens Railway & Electric Company until that company was acquired by the Georgia Power Company in February, 1927. Since that time he has acted as auditor of district offices and has been associated with the investment department.

Robert P. Woods Heads Clay County Property

Robert P. Woods vice-president and general manager of the Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo., was made president of that line on Jan. 10. He succeeds in this capacity, A. G. Hoyt, New York. Mr. Hoyt will remain with the line as a director. R. S. Mahan, general superintendent, was named vice-president succeeding Mr. Woods. Francis Mullan, New York, was named assistant secretary-treasurer and R. H. Delafield, New York, was elected chairman of the executive committee.

Mr. Woods became vice-president and general manager of the Kansas City, Clay County & St. Joseph Railway eight years ago. He had been city representative of the Kansas City Railways board of control since 1914. In this work he had had supervision over many of the improvements made by the company. He continued as consulting engineer to the board as he was in a position to direct the carrying out of the extensive traffic improvements which were being made under the direction of John A. Beeler.

Mr. Woods has had a long career in railway activity. In 1901 he was made chief engineer in charge of construction of the Wabash River Traction Line. One year later he was appointed to a similar position with the Indianapolis-Shelbyville interurban. From 1902 to 1904 he served the Indianapolis & Northwestern Traction Company as chief engineer. Later he was consultant in charge of design and construction of the Lebanon - Thornton Electric Railway, Lebanon, Ind. When the line was completed he was made vice-president and general manager. This position was followed by his becoming president of the company. From 1911 to 1913 he had charge of the building of the 80-mile line of the Kansas City, Clay County & St. Joseph Railway.

Mr. Woods was born in Buffalo, N. Y., in 1870. At the age of 21 he entered engineering work. For the next ten years he was engaged in a number of utility projects.

Dwight P. Robinson Heads New Concern

Engineer of wide experience elected president of United Engineers & Constructors, Inc.

DWIGHT P. ROBINSON, for 35 years engaged in bringing large construction enterprises to completion with speed and economy, has been selected as president to head the United Engineers & Constructors, Inc., organized to merge Dwight P. Robinson & Company, Inc., New York; the U. G. I. Contracting Company, Philadelphia; Public Service Production Company, Newark, N. J., and Day & Zimmermann Engineering & Construction Company, Philadelphia, to which reference is made elsewhere in this issue.

With his organization of unusually capable and devoted men, Mr. Robinson, as the first president of the American International Shipbuilding Corporation, developed Hog Island. He resigned from this company in the spring of 1918

D. P. Robinson

and in the fall of that year he organized Dwight P. Robinson & Company, Inc., New York, to conduct an engineering and construction business. One of the first contracts of this company was for the design and construction of the Colfax power station for the Duquesne Light Company, Pittsburgh, planned for an ultimate capacity of 360,000 kw. In 1920, Dwight P. Robinson & Company absorbed Westinghouse, Church, Kerr & Company, established in 1884, and nationally known as railroad and industrial builders.

Mr. Robinson was born in Boston on May 1, 1869. In 1890 he was graduated from Harvard and two years later from the Massachusetts Institute of Technology, where he obtained his electrical engineering education. After graduation, he was an assistant in the mechanical engineering laboratory at the latter institution and in 1893 joined the organization of Stone & Webster. Within a few months he was placed in charge of the Chicago office of that company. From 1895 until 1903 he was engaged in operating light and power properties under Stone & Webster management.

In 1903 Mr. Robinson returned to Boston in charge of all Stone & Webster engineering, and when the Stone & Webster Engineering Corporation was formed he was made president in charge of both engineering and construction activities. In 1912 he was admitted to partnership. From 1912 to 1918 he had charge of notable hydro-electric developments in Washington, California, Connecticut, Maine, Georgia and Montana, and the building of steam power stations at Seattle, Minneapolis, Boston, Houghton (Mich.), Savannah, Jacksonville, Tampa, Pensacola, Columbus, Dallas, Fort Worth, El Paso, Houston, Port Arthur, Pittsfield, New Bedford and Bridgewater, Mass.

Barney Frauenthal Honored by St. Louis Railway Club

Whether the recent eulogy of Barney Frauenthal by W. G. Besler, chairman of the board of the Central Railroad of New Jersey, speaking before members of the St. Louis Railway Club, was the real cause, at any rate the members of that organization have wanted to express their appreciation of the work of their secretary. Accordingly at the meeting on Dec. 9 Mr. Frauenthal was presented a handsome radio set by the club, Mr. Hannauer, president of the Boston & Maine, coming all the way from New England to take part in the presentation.

Mr. Frauenthal has served the St. Louis Railway Club from 1906 to 1927. His activities have not been confined to the railroad world alone, as his civic interests have been quite extensive. When the new Union station was built in St. Louis in 1894, he was put in charge of the bureau of information and there provoked much public comment and won praise for his quickness, accuracy and reliable memory. He later became general ticket agent of the Terminal Railroad, in which position he remained until he was made special assistant to the late Benjamin F. Bush, federal director of the Southwestern Region.

Before the termination of "Federal Operation," Mr. Frauenthal accepted a position with Rolla Wells, receiver of the United Railways of St. Louis, as general traffic agent, which office he holds with the United Railways' successor, the St. Louis Public Service Company.

Probably few men in the city of St. Louis have so wide a circle of friends as Mr. Frauenthal. His acquaintance in the railroad and electric railway world is national.

The St. Louis Railway Club has about 1,000 members.

CLIFFORD J. DELBRIDGE, for seven years accountant and traveling auditor, checking auto transportation operators for the Department of Public Works at Olympia, Wash., has resigned to devote his time to the Portland, Centralia & Cowlitz Valley Truck Line, which he owns.

Manufactures and the Markets

New Officers Elected for Westinghouse Electric

At a meeting of the board of directors of the Westinghouse Electric & Manufacturing Company, held in New York recently, the following officers were elected: Clinton M. Finney, comptroller; Warren H. Jones, secretary; Edward J. Mulligan, assistant secretary.

Mr. Finney comes to the Westinghouse organization from the Worthington Pump & Machinery Company, where he held the office of comptroller since 1919 and of vice-president since 1926. Prior to that time he was secretary and treasurer of the Mack Truck companies and treasurer of the George V. Cresson Company. He is a native of Pennsylvania and a graduate of the University of Pennsylvania. In 1926 he was elected president of the National Association of Cost Accountants.

Mr. Jones has held the position of assistant secretary of the Westinghouse Electric & Manufacturing Company since 1911. He was previously secretary to Robert Mather, former chairman of the Westinghouse board. He was born in Amherst, Mass., graduated from the LaGrange, Ill., High School, and studied law at the Chicago Law School and in the legal department of Winston, Payne & Strawn, Chicago.

Mr. Mulligan after attending the Port Richmond, Staten Island, High School, began his business career as office boy to George Westinghouse 25 years ago. Since that time he has remained continuously in the executive department of the Westinghouse company, rising from one position to another. During recent years he was secretary to James C. Bennett, formerly comptroller and secretary, now vice-president.

Receiver Authorized to Purchase 23 Freight Cars

William A. Carson, receiver for the Evansville & Ohio Valley Railway, Evansville, Ind., operating to Mount Vernon, Grandview and Henderson, Ky., has been authorized by Judge Elmer Q. Lockyear, of the Vanderburgh County Probate Court, to buy 23 freight cars to haul coal and gravel. The receiver stated that this number of cars could be purchased from a Kentucky firm at a reasonable figure.

Ten New Units Arrive for Milwaukee Electric Lines

Genuine leather upholstery and added seating capacity are innovations in the ten new one-man cars recently received by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., from the manufacturer, the St. Louis Car Company, St. Louis. Mention that the order for these cars had been placed was made in the issue of the JOURNAL for Oct. 15, 1927. Except for minor details they are identical with 50 cars bought a year ago.

The cars, built at a cost of nearly $14,000 each were scheduled to be placed in service on the State Street line (Route 11) on Sunday, Jan. 15.

The new cars have semi-indirect lighting fixtures, electric heaters, automatic treadle exits, concealed air-control pipes, and latest safety devices. Seating capacity for 55 passengers is provided as well as a reversible, upholstered operator's seat with backrest on each platform in place of a portable stool.

Much of $200,000 Program for Asheville's Railway

The Carolina Power & Light Company has appropriated $200,000 for improvements and further extension of its system in Asheville for the year 1928. The full program has not been completed, but extensions of the railway and possible improvements to the present office facilities will be included in the expansion.

With completion of the 1928 building program, the company will have expended approximately $500,000 in the past three years. More than $90,000 has been spent in extension of the railway system during the past ten months, while next year quite a large sum will be set aside for the same purpose. The carhouse now under construction in Mud Cut will cost $150,000.

Construction and Contracting Firms Merge

Dwight P. Robinson & Company, Inc., U.G.I. Contracting Company, Public Service Production Company, Day & Zimmermann Engineering & Construction Company are Brought under the title "United Engineers & Constructors, Inc."

THE merger, under the name of United Engineers & Constructors, Inc., of four important engineering and contracting organizations was announced on Jan. 17, 1928. The companies included are: Dwight P. Robinson & Company, Inc., New York; U.G.I. Contracting Company, Philadelphia; Public Service Production Company, Newark, N. J., and Day & Zimmermann Engineering & Construction Company, Philadelphia.

The new company is launched with contracts in hand amounting to more than $100,000,000. With the work now under way, including the construction of large dams for the Government on the Ohio River, extensive hydro-electric developments on the Housatonic River in Connecticut, important work in South America and in Spain, and large office and apartment buildings in New York and other cities, United Engineers & Constructors starts business with an unusual program. Dwight P. Robinson has been selected president of the new company. Directors include Mr. Robinson, Arthur W. Thompson, president United Gas Improvement Company, who is chairman of the board of the new company; Thomas N. McCarter, president Public Service Corporation of New Jersey: Samuel T. Bodine, chairman of the board of directors United Gas Improvement Company; Paul Thompson, a vice-president of the United Gas Improvement Company and president of the Philadelphia Gas Works Company; and John E. Zimmermann, president of Day & Zimmermann, Inc.

Details of the financial features of the plan under which the combination was effected have not been made public but it is understood that an exchange of stock similar to the proceeding in the acquisition of Day & Zimmermann, Inc., by United Gas Improvement Company is involved.

The new company is singularly well equipped by virtue of wide geographical range of offices to undertake engineering work in many localities. Headquarters will be in Philadelphia but local representation in New York, Newark, N. J., Chicago, Los Angeles, Atlanta, Houston, Pittsburgh, Montreal, Buenos Aires and Rio de Janeiro will be maintained.

Each of the companies involved has a record for successful consummation of large engineering projects with particular relation to the public utility field.

The U.G.I. Contracting Company's operations date back to 1882, when the United Gas Improvement Company was incorporated to engage in engineering and construction. After the United Gas Improvement Company had branched out into the operation and management of utility properties, it continued the contracting business as a construction department. For years the principal work was building and installing Lowe carburetted water gas plants, patents for which were held by United Gas Improvement Company. The operations expanded, taking in the building of coal gas and electric power plants and manufacturing and applying road binders. The U.G.I. Contracting Company was incorporated in April, 1919. It has built and equipped gas and electric plants, office buildings, factories, bridges, piers, tunnels and roads. It has built more than 1,000 carburetted water gas plants.

Digitized by Google

Recently it acquired the rights to build the German "Stettiner" coal gas ovens in America. Among the steam power plants built by the U.G.I. Contracting Company are the 50,000-kva. Barbadoes Island station, near Norristown, Pa., the 75,000-kva. Devon (Conn.) station, the 37,500-kva. Big Sioux (Sioux City, Ia.) station and the 33,333-kva. station of the Comal Power Company, New Braunfels, Tex. It also built the Stevenson dam and power plant on the Housatonic River in Connecticut and four dams and locks on the Ohio River for the United States government, which form part of the Government's program to make the river navigable at all times. It has under construction extensive hydro-electric developments in Connecticut and Vermont.

Public Service Production Company, a subsidiary of Public Service Corporation of New Jersey, was incorporated on Jan. 27, 1922. It built the $33,000,000 Kearny electric station, the Harrison gas works of Public Service, as well as many substations, garages and other buildings, and has erected considerable mileage of high tension lines and has done other work of importance for these organizations. It has also built roads in New Jersey, North Carolina and other states, including the so-called "covered cut," the approach to the Holland vehicular tunnel, has erected several important mills and factories and office buildings, including the eighteen-story Federal Trust Company building, Newark, and has performed many engineering and construction services for public utility, industrial concerns and steam railroads.

Day & Zimmermann Engineering & Construction Company was organized by Day & Zimmermann, Inc., to handle its engineering and construction activities. This firm has a background of more than 25 years of experience in the layout, design and construction of industrial plants, power plants, transmission lines and wide variety of general structures such as hotels, office buildings, warehouses, and port terminal developments. The 220,000-volt transmission lines from Conowingo to the Philadelphia territory are now under construction by this organization. It has been responsible for the design and construction of hydro-electric and steam electric power plants such as the 60,000 kw. (Saxton) station for Penn Central Light and Power Company.

During the war Day & Zimmermann did work for the United States Army, the Navy, the Shipping Board and the Alien Property Custodian. Included among the projects done for Government agencies was the United States Army Supply Base at Philadelphia, comprising the largest piers and warehouses in the port of Philadelphia. For many years Day & Zimmermann have been engaged in the layout and construction of large industrial enterprises such as new plants for the International Harvester Company, American Type Founders Company, Erie Forge & Steel Company, and many others. Institutional work has included such construction as the new dining hall and extension to buildings at Girard College, Philadelphia. Recently Day & Zimmermann have entered actively the field of hotel and hospital construction. The work of Day & Zimmermann Engineering & Construction Company is entirely separate from the investigation, report and management work which is done by Day & Zimmermann, Inc.

Dwight P. Robinson & Company has been a leader in the construction of large office buildings, hotels and apartment houses in New York, Chicago, Boston, Buffalo and other cities. Activities in addition to building work, include the design and construction of steam power stations, hydro-electric developments, substations, transmission systems, railroad shops, freight terminals, electrification of railroads, locomotive and passenger terminals, coaling stations, sugar refineries, smelters, lead plants, fertilizer plants, lumber mills, tanneries, shops, steel mills, foundries, textile mills, chemical plants, pipe lines and pumping stations, filtration and disposal plants, harbor and dock works.

The company has performed a large volume of work abroad. The principal contracts consist of irrigation projects for the Brazilian Government in northeastern Brazil, the construction of the Embassy of the United States at Rio de Janeiro and of the exhibits buildings during the Brazilian-Centennial Exposition, and the erection of an office building for the Rio de Janeiro Tramway, Light & Power Company, now in progress. In addition, important work is now being undertaken in Argentina.

General Electric Orders for 1927

Orders received by the General Electric Company during the year 1927 amounted to $309,784,623 compared with $327,400,207 for 1926, a decrease of 5 per cent, President Gerard Swope has announced.

For the three months ended Dec. 31 orders amounted to $76,708,532 compared with $80,406,570 for the final quarter of 1926, also a decrease of 5 per cent.

Sales billed and earnings for the year will be announced the latter part of March, when the annual report of the company is published.

Thirteen Buses in Puget Sound Power Budget

Included in the budget of $5,000,000 proposed for extension and construction work during 1928 by the Puget Sound Power & Light Company, Seattle, is provision for purchase of thirteen de luxe motor coaches to be put into the stage service during the year. These will be operated by the Pacific Northwest Traction Company, and by the North Coast Transportation Company, subsidiary concerns, both of which maintain offices in the company's Central Terminal building in Seattle.

Versare Bus for Boston Elevated Arrives

The Versare six-wheel bus is being introduced in Boston by the Boston Elevated Railway. The first bus from the Versare Corporation, Albany, N. Y., has arrived and is assigned to a route through the western business section of the city, from the Back Bay district to Bowdoin Square.

Washington Railway New Cars Scheduled for April Delivery

Details of the twelve cars for the Washington Railway & Electric Company, the order for which was mentioned in the JOURNAL for Dec. 17, 1927, have recently been released. The order for the units was placed with the J. G. Brill Company, Philadelphia, Pa. The cars will have an over-all length of 42 ft. 3 in., a seating capacity for 49 passengers, and will be of semi-steel construction. The exterior color scheme is to be cream and blue and the interior trim gray enamel and cherry. Four GE-265-A outside-hung motors are specified. Subjoined are the specifications as released by the Washington Railway & Electric Company.

Number of units	12
Type of unit	One-man, motor, passenger, city double-end, double-truck
Number of seats	49
Builder of car body	J. G. Brill Company, Philadelphia, Pa.
Date of delivery about	April 1, 1928,
Weight of car body	21,840 lb.
W ight of truck	18,360 lb.
Total weight	40,200 lb.
Bolster centers	19 ft.
Length over all	42 ft. 3 in.
Length over body posts	28 ft. 5 in.
Truck wheelbase	4 ft. 10 in.
Width over all	8 ft. 5 in.
Height, rail to trolley base	11 ft. 8 in.
Window post spacing	29¼ in.
Body	Semi-steel
Roof	Monitor
Doors	End, folding
Air brakes	Westinghouse with variable load feature
Armature bearings	Plain
Axles	A.S.T.M., Specification A-20-21
Car signal system	Faraday high voltage
Compressors	Westinghouse DH-16
Conduit	Flexible
Control	K-35-JJ
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Keystone
Door mechanism	National Pneumatic
Energy saving device	Arthur power recorder
Fare boxes	Cleveland
Finish	Paint
Floor covering	Flexolith
Gears and pinions	Tool Steel Gear & Pinion Company
Glass	Plain
Hand brakes	Peacock staffless
Hand straps	Buffalo type
Heaters	Railway Utility
Headlights	Crouse-Hinds
Headlining	Agasote
Interior trim	Gray enamel and cherry
Journal bearings	Plain
Journal boxes	Brill
Lamp fixtures	Electric Service Supplies Company, dome type
Motors	Four GE-265-A, outside hung
Painting scheme	Cream and blue
Roof material	Canvas
Safety car devices	Westinghouse Traction Brake Company
Sash fixtures	Curtain Supply Company
Seats	Brill de luxe
Seat spacing	29¼ in.
Seating material	Genuine leather
Steps	Folding
Step treads	Kass
Trolley catchers	Ohio Brass
Trolley base	Ohio Brass
Trolley wheels	More-Jones
Trucks	Brill 76-E-1
Ventilators	Railway Utility Company
Wheels, type	30-in., chilled iron
Wheelguards	Root

Bids for Carhouse at Tacoma to Be Received

The Board of Contracts and Awards, Tacoma, Wash., it was recently reported, would receive bids soon for construction of a carhouse for the municipal belt line. Plans call for a building of frame and timber construction, to be completed within 45 days after signing of contract.

Week in Non-Ferrous Metals Quiet

Consumers of non-ferrous metals appear to be waiting for "something to turn up," judging from the comparatively small volume of sales during the week ended Jan. 18. None of the markets is dead, but the tonnage sold has been below the average. Except for New York lead, prices are quoted a little lower all along the line so far as domestic business is concerned. In London there has been practically no change in price levels, except that tin has declined.

A very sharp distinction can be drawn between the position of the important primary producers of copper and the so-called "custom" sellers. Without exception the former have been quoting 14⅛ cents, and that they have the courage of their convictions is proved by the fact that not a ton was sold by them. Actual sales in moderate volume were made each day until Jan. 18, during the week, at prices ranging from 14 cents to 14.10 cents, Valley, and at 14.125 cents at Middle West destinations. The preponderant tonnage has been placed at 14 cents. Business in the foreign market has been fair, about 25,000 tons having been sold thus far at the c.i.f. price of 14.50 cents.

The lead market has been disrupted in the week ended Jan. 18 by offerings by a Middle Western dealer at 6¼ cents, St. Louis—five points less than any producer had theretofore been willing to sell at. Producers have not been willing to meet this price, though the availability of lead at the lower level has been admitted, and to meet their regular customers halfway a 2½-point concession has been made from the quotations ruling last week, thus bringing producers' prices to 6.275@6.30 cents.

In the East, all sellers continue to quote at the contract price of the American Smelting & Refining Company—6½ cents, New York, for all deliveries, though lead is said to be available at some other consuming centers in the East at somewhat less than the usual differential from New York prices.

Zinc in fair volume was traded in during the week at 5.625 cents. A few sales for May-June delivery brought 5.65 cents.

London tin dropped below £250 on Jan. 16, and is now lower than for almost three years. Correspondingly low prices have obtained in New York, business having been done as low as 54¼ cents on Jan. 17 and 18.

ROLLING STOCK

TORONTO TRANSPORTATION COMMISSION, Toronto, Canada, has accepted delivery on fifteen Mack bus chassis, 233-in. wheelbase, six-cylinder motors, model AL. Bender Body Company is building the bodies.

PUBLIC SERVICE TRANSPORTATION COMPANY, affiliated with the Public Service Railway, Newark, N. J., has ordered five White Model 53 buses, supplementing recent orders for twelve of the same model and ten Model 54.

ELECTRIC RAILWAY MATERIAL PRICES—JAN. 17, 1928

Metals—New York

Copper, electrolytic, cents per lb	13.788
Lead, cents per lb	6.50
Nickel, cents per lb	35.00
Zinc, cents per lb	5.975
Tin, Straits, cents per lb	54.25
Aluminum, 98 or 99 per cent, cents per lb.	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Franklin, Ill., screenings, Chicago	1.70
Central, Ill., screenings, Chicago	1 55
Kansas screenings, Kansas City	2.175

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb	2.80
Tie plates (flat type), cents per lb	2.25
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	1.80
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb	2.80
Sheet iron, galvanized (24 gage), cents per lb.	3.65
Galvanized barbed wire, cents per lb	3.25
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb	16–20
Waste, cotton (100 lb. bale), cents per lb.:	
White	16–19.50
Colored	11–16

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.2
White lead in oil (100 lb. keg), cents per lb.	13.25
Turpentine (bbl. lots), per gal	$0.65
Putty, 100 lb. tins, cents per lb	5.25–5.50

Wire—New York

Copper wire, cents per lb	15.875
Rubber-covered wire, No. 14, per 1,000 ft.	5.30
Weatherproof wire base, cents per lb	16.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.85
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y	1.75
Sand, cu.yd., f.o.b. N. Y	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb	11.875
Light copper, cents per lb	10.25
Heavy yellow brass, cents per lb	7.375
Zinc, old scrap, cents per lb	3.625
Lead, cents per lb. (heavy)	5.31
Steel car axles, Chicago, net ton	$16.25
Cast iron car wheels, Chicago, gross ton	14 25
Rails (short), Chicago, gross ton	15 50
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	8 00

TRADE NOTES

NATIONAL PNEUMATIC COMPANY.—In the advertisement of this company appearing in the Jan. 7 issue of this paper, instead of the new Springfield, Mass., car, the car of another property was inadvertently shown.

C. MARSHALL TAYLOR has been appointed vice-president and general manager of the Curtin-Howe Corporation, 11 Park Place, New York, which holds the commercial rights to the new wood preservative developed by the engineering laboratories of the Western Union Telegraph Company. Mr. Taylor has been actively engaged in wood preservation since 1906, when he became associated with the International Creosoting & Construction Company, Galveston, Tex., in charge of that company's department of chemistry and tests. He served one year as assistant professor of chemistry at Swarthmore College and then built and operated for fifteen years the Port Reading Creosoting Plant for the Reading Company and the Central Railroad of New Jersey. During that period he was a member and subsequently chairman of the American Railway Engineering Association's committee on wood preservation. He served one term as president of the American Wood Preservers Association and is an affiliate of the American Society of Civil Engineers.

C. N. THULIN, vice-president of the Duff Manufacturing Company of Pittsburgh, has taken over the supervision of the Eastern sales district in addition to the Western sales district of this firm, of which he has been in charge for several years. Mr. Thulin's headquarters will be in New York and Chicago. W. G. Robb has been appointed district manager of the New York district, with headquarters at the company's office, 250 Park Avenue, New York. E. E. Thulin has been appointed district manager of the Chicago district with headquarters in the Peoples Gas Building, Chicago.

ADVERTISING LITERATURE

CROUSE-HINDS COMPANY, Syracuse, N. Y., has issued an illustrated mailing folder descriptive of its new Obround condulets, and bulletin 2104 on its "Wedgtite" pipe hangers.

GENERAL ELECTRIC COMPANY, merchandising department, Bridgeport, Conn., has issued a small folder entitled "The Concentrated Arc in Welding."

OHIO BRASS COMPANY, Mansfield, Ohio, is mailing an illustrated folder, No. 138H, entitled "Take a Tip" calling attention particularly to its O-B double-arm and pole-top insulator fittings. A return postal card is inclosed with folder on which a request can be made for the company's new booklet 516H.

ALBAUGH - DOVER MANUFACTURING COMPANY, Chicago, Ill., has recently issued bulletin A in the form of an illustrated booklet giving complete information on its speed reducers.

A Champion for the Car Rider Arises in Philadelphia

PHILADELPHIA at last seems to be awakening to the serious nature of its traffic congestion problem. At least partial credit for that awakening must be ascribed to the shrill alarm sounded by the local transportation company. "Give the 80 per cent a square deal" has been and is still being held before the eyes and dinned into the ears of the people in an intensive advertising and publicity campaign described elsewhere in this issue. The 80 per cent is, of course, that overwhelming majority of street users who enter and traverse the downtown area by means of the street car.

The Philadelphia Rapid Transit Company is frank to admit, in sponsoring this campaign, that its own ends will be served, as well as those of the car rider, in any speeding up of street traffic which may be effected. But it is significant that the newspapers and civic associations of Philadelphia, while realizing this fully, have been unanimous in their approval and active backing of the undertaking.

Much of today's street congestion is due to the human factor—to that spirit of impatience, of headlong speed and of indifference to the rights and privileges of fellow beings which seems to characterize city living in this 20th Century. If he is an autoist, he will park when, where and for as long as he pleases, or can get away with. He will cut in and out of traffic lanes with a mere shrug of the shoulders for the danger he is causing to others and to himself. He will block traffic for others but curse volubly when his own way is barred by another individual of the same stamp.

The pedestrian is not much better. He has little or no regard for traffic signals, anti-jay-walking edicts and other safeguards for life and limb, unless a policeman with a big stick cows him into submission. Truly, he rushes in where angels fear to tread.

Such tactics as these are bacilli from which germinate many of our present traffic diseases. If the slate could be wiped clear of human folly, our metropolitan areas could readily get along for a few years without the tremendous engineering developments in subways and elevated highways which are now being proposed on every hand to relieve street congestion.

It is a matter of education and of pleas to the common sense of the individual. That is what the Philadelphia Rapid Transit Company has been trying in its community. It is no use to call upon the strong arm of the law for assistance while public opinion remains apathetic. That same public opinion is often a very difficult thing to arouse on matters which properly should concern it. Still greater difficulty may be experienced in maintaining the sentiment once aroused.

One thing the transportation company has very definitely accomplished with its "80 per cent," however. It has fixed the blame for traffic delays squarely upon those who are responsible. Easy enough to attack the transit organization when cars are tied up and passengers are forced to wait on chilly street corners. But the company has demonstrated to the satisfaction of fair-minded Philadelphia citizens that it is vitally interested in getting its cars through traffic on schedule time. It has planked down cold cash to get that thought across.

The Brady Award Will Help the Cause of Safety

SAFETY in railway operation has always been a prime consideration of the managements. Safety for passengers—at least reasonable safety—had to be assured, as otherwise there would be no patrons. Safety for persons other than passengers had also to be obtained because of the danger of damage suits. Yet it is somewhat remarkable that the emphasis now placed on safety by railway companies is a comparatively modern development. This is shown by the fact that the first comprehensive safety exposition in America was held in New York City less than 15 years ago.

A tremendous impetus to the safety movement on electric railways was undoubtedly given by the great increase in number of automobiles on the streets which has come about during the last decade and a half—and is still continuing. Today no electric railway organization is complete without its safety division or department. There is every reason to believe that the attention now being given to safety on most electric railway properties will increase rather than decrease as years go by. It is a matter for congratulation, therefore, that the Brady annual awards to electric railway companies for excellence in safety methods and results have been revived.

These awards were first made in 1914 when under the original deed of gift one medal was given to the company submitting the best record of methods and the two other medals were given to individual officers or employees of the same company because they had distinguished themselves by efforts to promote safety on their property. This plan has now wisely been changed so that the three awards are made to three different companies, representing respectively large, medium-sized and small properties. The change permits fairer judgment on the merits of the contestants' claims because it is obviously very difficult for anyone to fix standards of operation which will fit equally well companies with widely different outputs in annual car-miles.

The winning company in the largest class this year, the Louisville Railway, is very closely associated in the minds of most railway men with the modern safety

Digitized by Google

movement. This is partly because of general knowledge of what the company has done along these lines. It is also partly due to the active interest which its president, James P. Barnes, has always taken in matters relating to safety. The safety work of the other two winners, the El Paso Electric Company and the Tide Water Power Company, are less well known only because of their smaller size, so that their efforts have been on a less extensive scale. But the records show that both have accomplished wonderful results.

An account of some of the safety methods in Louisville appears in this issue. Later issues will tell of the work done by the other winners.

Mileage and Securities in Receivership Materially Reduced

JUST as 1926 showed an improvement in the number and importance of electric railway companies in receivership over 1925, so 1927 showed an improvement over 1926. The situation of the Chicago Railways is peculiar in that the principal of the bonds is in technical default, but the interest payments are being made from earnings that are in every way more than adequate for all the company's financial purposes. There the ability to refund was to a very large measure presaged on the settlement of the franchise situation. That property, through no inherent fault of its own, is the only large city system still subject to the jurisdiction of the courts. The Des Moines case is also peculiar in many respects, since that company was unable to refund one of its maturing obligations. There the earnings situation is not so auspicious as is that of the Chicago company, and while it is a cause for anxiety, the concern is more over general economic conditions and the uncompromising attitude of labor, which has refused to co-operate with the company to the extent of making it possible for the railway to put into effect economies that would have helped materially to avert the receivership.

As to the facts and figures of receivership for 1926 they show a decided reduction in mileage, capital stock and funded debt involved in such proceedings. The biggest help to this end was the lifting of the receivership of the United Railways in St. Louis with its 450 miles of track. The way had long been prepared for this change, but it was not until quite recently the St. Louis Public Service Company, the successor road, formally took over the property. The delay there in carrying out the plan was undoubtedly due in no small measure to the franchise situation, still to be settled by the enactment of a new grant modern in its terms.

Two large interurban properties are still in receivership, the Detroit United Railway and the Union Traction Company of Indiana. Each of these roads has more than 400 miles of track. Only six of the remaining 48 companies in receivership at the close of the year have more than 100 miles of track. Eight of the 48 companies have 50 or more miles and the balance of 34 companies have less than 50 miles of track.

These are merely the major factors. The details were given in the Jan. 14 issue. Taking into consideration the reduction of almost 13 per cent in mileage and 22½ per cent in securities involved in receivership and with the prospect of several of the large companies reorganizing this year, the outlook for 1928 is more encouraging than it has been for many years.

San Francisco's Municipal Railway Is No Exception to the Rule

AFTER allowing for charges that practically put it on a par with privately owned companies, the Municipal Railway in San Francisco piled up a loss of $240,228 for the year ended June 30, 1927. The details are given in the issue for Jan. 7, but the matter deserves attention beyond mere presentation of the statistical data. Let it be said at the outset that great perspicacity has been shown in the management of the system. No one can gainsay that. Despite this the record is not the rosy one some of the proponents of municipal ownership paint it. The earned surplus for the 14½-year period of operation is $2,835,000, but when the comparison charges intended to bring the property into line with the burdens a private company would have to bear are taken into consideration the system, operating under a 5-cent fare, is found to be in the red about $314,000.

At first blush this appears to be pretty good. But it must be taken into account that the railway is one of only 74 miles, operated from its inception in one of the most populous sections of the city. Now there are 11.89 miles of bus lines doing none too well. One of the most vociferous of the advocates of the system says that under conditions prevailing prior to 1917 the railways in San Francisco could easily have paid for themselves out of earnings on the 5-cent fare. It is a nice hypothetical question, but it does little good so to speculate since the times have changed greatly, as the report under review indicates. In this case it is a condition and not a theory that confronts the system, which is gradually being brought into a state that more nearly approximates the condition of the average privately owned system.

A champion of municipal ownership has said that doubtless the new lines and the added bus routes are useful in the development of the outlying sections, but "they are putting a strain on the 5-cent fare." Even its proponents now admit that under present conditions it is apparent that for the future, with even the most conservative extension policy, the municipal railway cannot hope to earn a substantial surplus above interest charges, without making any provision for bond redemption or the construction of extensions out of earnings.

Dallas Should Heed the Plea of Its Railway

CASH fares of ten cents are asked by the Dallas Railway & Terminal Company in a request filed with the Board of Commissioners of that city. The other fares would be 5 tickets for 35 cents, with students' tickets at 4 cents, and children 5 to 12 years of age, 4 cents. The point made by the company is that by establishing an adult cash fare of 10 cents it is possible to give the regular user of the service a much lower rate than if a flat fare were established for all classes of riders.

At first sight this plea would not seem to be unusual. In some of its aspects it is not. It reflects the changed trend in economic conditions which has imposed unusual burdens on the electric railways, but more than that, it reflects conditions which beset the railway in the moderate sized city—Dallas has a population of 211,600—determined to keep its property up and to give the very best service possible. That, of course, cannot be done

Digitized by Google

without the constant expenditure of money. What the company now seeks is to keep up its credit standing, since in order to attract new capital to provide for extensions, betterment and improvement at reasonable cost the company's net earnings after the payment of operating expenses should be sufficient to pay a reasonable return on the property value, and in addition to accrue regularly to the various reserves enough to maintain them at normal, as defined in the franchise.

This is substantially the way the company put the case. Its plea has been referred to previously in ELECTRIC RAILWAY JOURNAL. Since the company began operation under the present modified service-at-cost grant on Oct. 1, 1917, it has failed to receive the full 7 per cent per annum on its approved property value by the sum of $536,331. Between April 1, 1926, and Dec. 31, 1927, the company expended $1,350,000 on improvements. During the next five years $2,228,000 will be needed for similar work, $1,050,000 alone for cars.

Dallas has long enjoyed one of the most up-to-date services in the country for a city of its size. It can, however, continue to enjoy that service only as it sees to it that its railway is adequately compensated. The Dallas railway has certainly played fair with the city. If it is to continue to prosper and grow as a city, Dallas must play fair with its railway.

Reno's Road to Transportation Ruin

CESSATION of service by the railway in Reno, Nev., last fall attracted considerable attention. Many newspapers and publications referred to the matter as indicating the passing of the street car, since it was stated that buses would be put in the service to replace the railway. If memory does not play false, even Arthur Brisbane took occasion to pen to 7,000,000 people, or whatever number it is he reaches in the chain for which he writes, a homily for their delectation. But that is quite a long while ago and Mr. Brisbane lives in the future, not in the past.

But the present concern is with the facts, not with prognostications affecting a whole industry tossed of by a sage who writes as he runs. What are the facts? The Reno road was one of 7.5 miles, built in a city of 12,016 population, not counting the flotsam and jetsam on the way to other experiences. There were six cars. The road represented the elation of promoters who sought to put in railway systems just north, east, south and west of every water-tower town that had hopes of springing into a metropolis. This is no reflection on Reno. It has a right to its ambitions and enthusiasms. But the record of Reno in history is not likely to rest on the fact that the railway there gave place to buses nor on the subsequent fact that the buses in turn have had to suspend service.

Not so much has been made of this latest fact, however. For some reason it is not the same savory morsel for comment as the passing of the railway. Reno has its place, as many people of both sexes have learned, but it is not the place for the bus or the trolley. This is no conclusion thrown off lightly in a moment of exhilaration. It is based on a plain statement of fact contained in a ponderous volume apparently unknown by the daily newspaper columnists and commentators. This big book is known as "Moody's Manual of Investments." It is a prosaic tome at the sight of which the inspiration of the literati would be immediately dispelled. This book is freezing in its formality, but it does contain facts.

For the three years that this volume records the earnings of the Reno road it sets down the gross at $40,641 in 1924; $39,155 in 1925, and $35,718 in 1926, and the deficits for the three years at $10,770, $4,820, and $8,902 respectively. The company never paid a dividend. The fact is that Reno's local transportation situation is no different from that of other small communities. The fault is not with the trolley or the bus. The fault is with Reno. It is just not big enough to support any kind of organized transportation service, other perhaps than the taxi.

One Good Plan in Practice Is Better Than Many Plans in Contemplation

PERSONAL opinions advanced without facts or figures to support them constitute one of the big obstacles in the way of solving the traffic problem. Of course, every one is entitled to his own opinion on this subject, and to express it if he so desires. But personal opinions are not facts, and any satisfactory solution of the problem must be based on facts. For instance, a statement is made in a letter recently published in the New York *Times* that "it is doubtful whether it would be possible to increase the efficiency of the streets under present conditions by the enforcement of any regulations old or new to more than a very few per cent, whereas the situation calls for an increase of several hundred per cent." The writer of the letter believes that some sort of double-deck arrangement is the only way by which effective relief can be obtained. No data are presented to support either of his contentions.

Statements of this kind unsupported by facts or figures are not very convincing. In this instance the writer's first contention is easily shown to be false. Take Fifth Avenue, New York, for example. During the maximum hour a total of about 1,200 northbound vehicles pass 42d Street moving in two lanes at an average speed of approximately 5 miles per hour. With properly designed signal lights it would be possible for this traffic to move much faster. Experience has shown that the greatest volume of traffic moves along the street when the speed is about 15 miles per hour. No reason exists why this speed could not be attained on Fifth Avenue, New York, as has been done in various other cities. With parking eliminated traffic could move in three lanes. Under these conditions a total of more than 5,000 northbound vehicles per hour could be accommodated, an increase of more than 400 per cent.

Hope of relief from traffic congestion lies in making better use of existing streets rather than double decking streets, removing the elevated railway pillars, putting street cars underground and similar schemes. To try improved regulation and control would cost very little. The ultimate fate of such a plan would, of course, depend on the degree of success realized in use.

But experimentation is not the way of the New York municipal authorities. For fear of giving offense they hesitate to adopt any traffic regulations to which objection is made. Instead of trying any of the various reasonable plans that have been suggested for relief, the authorities continue to grope blindly for some ideal plan that will suit everybody. Meanwhile, congestion grows worse and the cost of traffic delays mounts higher and higher.

Judges Award Safety Prizes

Electric Railways in Louisville, El Paso and Wilmington, N. C., win Brady Awards. Honorable mention for Pittsburgh

AS ANNOUNCED briefly in last week's issue, three Anthony N. Brady Memorial Medals for outstanding accident prevention and health promotion work on electric railways, for the year ended Dec. 31, 1926, have been awarded by the judges of the contest. The winners are the Louisville Railway, Louisville, Ky.; the El Paso Electric Company, El Paso, Tex., and the Tide Water Power Company of Wilmington, N. C. The Pittsburgh Railways received honorable mention and will be given a certificate. Announcements of the awards were made jointly on Jan. 23 by the American Museum of Safety and the American Electric Railway Association. From other statistics it was found by these two organizations that the electric railway industry as a whole during the twelve-month period covered by the contest, had reduced its fatal accidents approximately 15 per cent. Only one out of every 155,000,000 passengers carried during this period was fatally injured. This is declared to be the lowest accident ratio for any vehicle using the public streets.

The awards for 1926 were made to three railway organizations. This is a change from previous practice. The committee's purpose in this, it was announced, was to promote active competition for the awards by every electric railway, however large or small. Bus systems are included in the statistics covering the awards where these are operated as part of an electric railway system. It is expected that the presentation of the medals will take place some time in February with appropriate ceremonies.

The Brady award, originated in 1914, was discontinued during the World War after having been won by the Boston Elevated Railway, the Union Traction Company of Indiana and the Connecticut Company, and has been restored by Nicholas F. Brady at the request of the American Electric Railway Association. Gold, silver and bronze medals are awarded as first prizes to three classes of companies operating more than 5,000,000, from 1,000,000 to 5,000,000, and less than 1,000,000 vehicle-miles, respectively. Louisville, El Paso and Wilmington won in the order named.

The committee on awards consists of Lewis Gawtry, president of the Bank for Savings in the City of New York. Colonel A. B. Barber, manager transportation and communication department, Chamber of Commerce of the United States; James H. McGraw, president of the McGraw-Hill Publishing Company, Inc., and Lucius S. Storrs, managing director of the American Electric Railway Association.

The committee on the conditions of the competition consisted of Thomas Fitzgerald, vice-president of the Pittsburgh Railways, chairman; H. K. Bennett, safety manager, United Electric Railways, Providence, R. I.; C. H. Evenson, superintendent of transportation, Chicago Surface Lines.

The conditions of the contest just decided provide that every competing company shall submit accident data covering all electric railway and bus operations comprising the entire system of which it is a part, without regard to technical ownership, as well as to cover broadly and as completely as possible, all of the factors prescribed by the committee as conditions for obtaining the award. These factors were:

The success in gaining good will as indicated by the initiative, skill and enterprise manifested in improved safety conditions.

The improved safety conditions which have resulted from original ideas, as well as the extent to which the company has taken advantage of new development of safety in operating and maintenance practice and equipment originating with others.

Improvements in safety practice which have resulted in reduced maintenance, or greater reliability of service.

Particular success in conducting a safety program and actually reducing the number and seriousness of accidents.

Outstanding accomplishments in development of co-operation between management and employees in safety promotion.

Outstanding accomplishment in measures to promote sanitation and health.

All presentations had to be in the hands of the American Museum of Safety on or before August 1, 1927.

Accompanying the report of the committee was a series of tables compiled from the statistics submitted. One of these, as relating to the winning companies, is presented herewith. An article on some of the safety practices of the Louisville Railway appears elsewhere in this issue. Particulars of the practice of the three other companies which won for them prizes or a certificate will appear in subsequent numbers.

SUMMARY—DERIVED RATIOS AND COMPARATIVE UNIT FIGURES, RAILWAY OPERATION

	Year	Louisville Railway	El Paso Electric Company	Tide Water Power Company (Wilmington)
Ratio—Cost of accidents to gross earnings—per cent.	1926	3.00	2.71	0.48
	1925	3.11	4.29	1.42
	1924	3.65	2.87	2.01
	1923	4.26	3.55	0.63
Ratio—Amount paid in settlement of claims to the total cost of claims—per cent.	1926	63.34	52.46	30.41

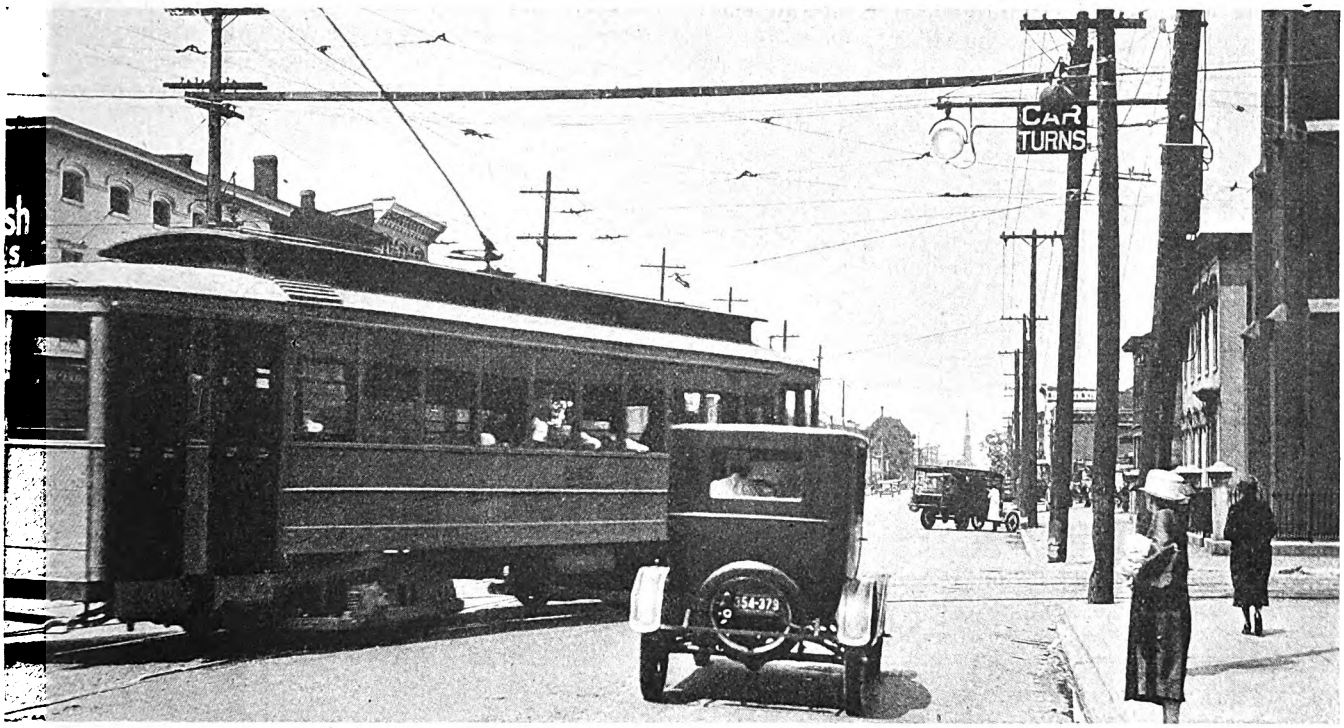
Safety a Science at Louisville

Winner of Brady medal prize for 1926 in large road class has devoted a great deal of study to safety precautions. Safety council is conducted by the employees. Various ways are adopted to maintain interest



The driver of the automobile at the right is warned by the "car turns" sign that the car is about to turn

A BANNER displayed in one of the buildings of the Louisville Railway reads: "Our safety ambition —to be the safest railway in America." It hangs in the hall where the company holds a dinner every month, at which the guests are the transportation employees having the best safety records during that month. This slogan, followed consistently and continuously, has won for the company the 1927 Brady medal for the best record in safety companies in its class, that is, to those operating more than 5,000,000 vehicle-miles during the year ended Dec. 31, 1926.

While officials of the company do not believe that safety is primarily a matter of equipment, they realize that good men with good tools can accomplish more than good men with poor tools. For this reason a great deal of thought has always been given to improved equipment and appliances which promise to reduce the number of the company's accidents. Several especially novel innovations were tried out during 1926. Among these may be mentioned "car turn" signs; the construction of additional safety zones and the shortening of the car lifeguards.

The "car turn" signs, of which one is illustrated, were installed at locations where experience had shown automobiles trying to pass on the right frequently hit street cars when the latter were making right-hand turns. The required equipment includes a red projector, a floodlighted sign, fitting and clearing contactors in the trolley wire, and a relay in a box mounted on a pole. When used with a Cheatham switch, the same operation of the car under the Cheatham contactor that throws the switch point before the diverging loop shunts out a relay in the normally closed circuit. This causes its armature to drop to a back contact, closing a circuit to illuminate the red projector and to floodlight a sign reading "car turns." The projector is equipped with a 50-watt lamp in a 9-in. parabolic glass reflector with red covered glass, the whole supplying a light that is brilliant even in daytime. The floodlight also has a 50-watt lamp in series with the projector. After the car has turned it passes under a normally open contactor of the short type, which picks up the "stick" relay again and thus removes the indication. This display of signals not only gives a warning, but explains the reason for it. The installation of these signs has greatly reduced accidents of this kind.

Forty-nine safety zone markers were installed on Broadway, the main artery for automobile traffic from the eastern and western sections of Louisville to the center of the city. The Louisville law had prohibited motorists passing standing street cars. This not only tended to delay automobile traffic but there were cases where automobile drivers failed to stop, striking boarding or leaving street car passengers. As the width of the thoroughfare made the establishment of safety zones practicable, several were installed. The zone markers are concrete pillars, roughly 3½x6 ft. in size. They are substantial enough to stop the most reckless driver. Their installation was completed early in 1926. The

Digitized by Google

local law was then changed to permit motorists to pass standing street cars. Since the safety zones were installed very few persons intending to board or leave Broadway street cars have been hit.

In addition to these zones eleven loading platforms were built on Broadway. They have a wooden base, roughly 6 in. above the surface of the street, and are 80 ft. long and 4½ ft. wide. At the end toward which traffic is moving on the side of the street where they are located, they are protected by one of the safety zone markers previously described. An iron railing runs the full length of each platform on the side past which traffic is flowing.

As another safety precaution the lifeguards on the cars were cut back so as to keep them in line with the bumper. This was done because police regulations in Louisville permit automobiles to pass street cars on the left. In practice it was found that the driver of many an automobile, in passing a car on the left, had to be in a hurry to get out of the way of traffic bound in the opposite direction and would cut back into his own traffic lane before he was far enough ahead of the street car. The result was that he frequently ran over the lifeguard of the car that he was trying to pass.

Besides this change in the car equipment in the interests of safety, the company has introduced on its cars features to improve sanitation. In a sense, they might properly be included as part of its safety work, as they tend to protect the health of the patrons and employees. The more important of these will be briefly mentioned.

All car ceilings are painted white to give the best light possible. Sanitary hand straps have been installed. Rear concealed vacuum type ventilators have been adopted.

A form of "waste basket" has been installed under the body of each car. The dirt and rubbish on the floor of the car at the end of each run are swept into these baskets rather than on to the ground or deposited in tin cans at line terminals. On safety cars the position of the heaters has been moved forward to give better distribution for both operator and passengers. Wooden strips have been added on the platforms where the motormen and conductors stand, to give them dry footing.

After All, Safety Depends on the Employees

The officials feel, however, that by far the greatest factor in its safety work has been the interest of the employees in it. Seven years ago, or on April 12, 1921, the Louisville Railway Safety Council was organized, as one of the functions of the Louisville Railway Co-operative Association, the association of the employees of the Louisville Railway and its subsidiary companies.

Operating under the safety council, and forming part of it, are twenty local committees, each made up of three men from each carhouse, power station or other unit division of the organization. These local safety committee men, as they are termed, are elected by the men of their units, and serve three months. They wear badges indicating their position. Their duties primarily are to make a thorough inspection of their unit at least once every two weeks, to report on unsafe conditions found, to give personal attention to fire equipment, lighting and sanitary conditions, to conduct safety educational activities and to supervise the instruction of old and new employees in the hazards that apply to their unit. The fact that the term of service is only three months makes it possible over a period of a few years to bring a majority of employees into personal contact with the safety movement through membership on these committees.

Once a month the twenty unit chairmen meet and exchange safety ideas. The company's director of safety presides over these meetings and he is the only officer of the company who takes an active part in the functioning of its safety council.

Once a month an inspection committee, composed of one man representing each kind of work, makes what is known as a monthly inspection trip. This inspection committee consists of a power house man, a track man, a man from the line department, one motorman, one conductor, one man from the shop, one office man, the director of safety, and the secretary of the co-operative association, who also acts as the secretary of the safety council. Without giving advance notice of the time when it may be expected, this committee goes over every piece of the company's property from a safety point of view.

The safety council also takes the lead in arranging safety rallies of different units on the Louisville company's property. These rallies have been found invaluable for arousing the enthusiasm essential to the accomplishment of the company's safety program. As a rule such a rally is held at each unit approximately once in every three months.

These rallies take two forms. One is a very short affair, attended only by the men at a given unit with brief talks by the director of safety or superintendent of transportation. The other kind ordinarily is held at night and is attended not only by the employees but also by their wives and sweethearts. Here there are two or three brief talks on safety, but refreshments are served, generally there is a musical program, and frequently the evening is ended with dancing.

Monthly Accident Contests

The safety work in Louisville is backed up by an appeal to the competitive instinct that is inherent in all men. This appeal has as its main feature a monthly accident contest between the various carhouses on the company's property. A dinner follows as a prize to the men of that carhouse who during the calendar month operate the greatest number of miles per accident. Two dinners really are necessary, one at noon for the men having night runs and one at 7 o'clock in the evening for the men who are on the road in the daytime.

The program followed is designed primarily to entertain the men present, on the theory that it is not necessary to talk safety to men who have won one of these dinners. As a rule there is music, one or two vaudeville acts, a moving picture and a short talk by some prominent guest. To avoid a tendency to rest on its laurels on the part of any carhouse that has won one dinner, the custom was established of permitting the employees of a carhouse able to win a dinner two months in succession to invite wives and sweethearts to the second one.

As interest in the monthly contest grew, the mileage per accident necessary to win a dinner steadily increased. In 1922 and 1923 it was no uncommon thing for a carhouse to win a dinner with an average of 6,000 miles per accident. In November 1926 the carhouse that won the dinner operated 79,651 miles per accident. A change has also been made in the regulations governing the dinner. Now, the men of any carhouse that operates 25,000 miles per accident without winning a contest in any calendar month are invited to that month's prize dinner as special guests.

The company has nine carhouses, and each month the men at each carhouse elect a safety captain to serve during the period of that month's contest. In addition to his other work he virtually acts as a "pep" leader. He does not receive any extra wages, but the company gives the captain whose carhouse wins the accident contest a

Digitized by Google

new suit of clothes as a personal prize. Apart from this no bonuses of any kind are paid in connection with safety work on the property.

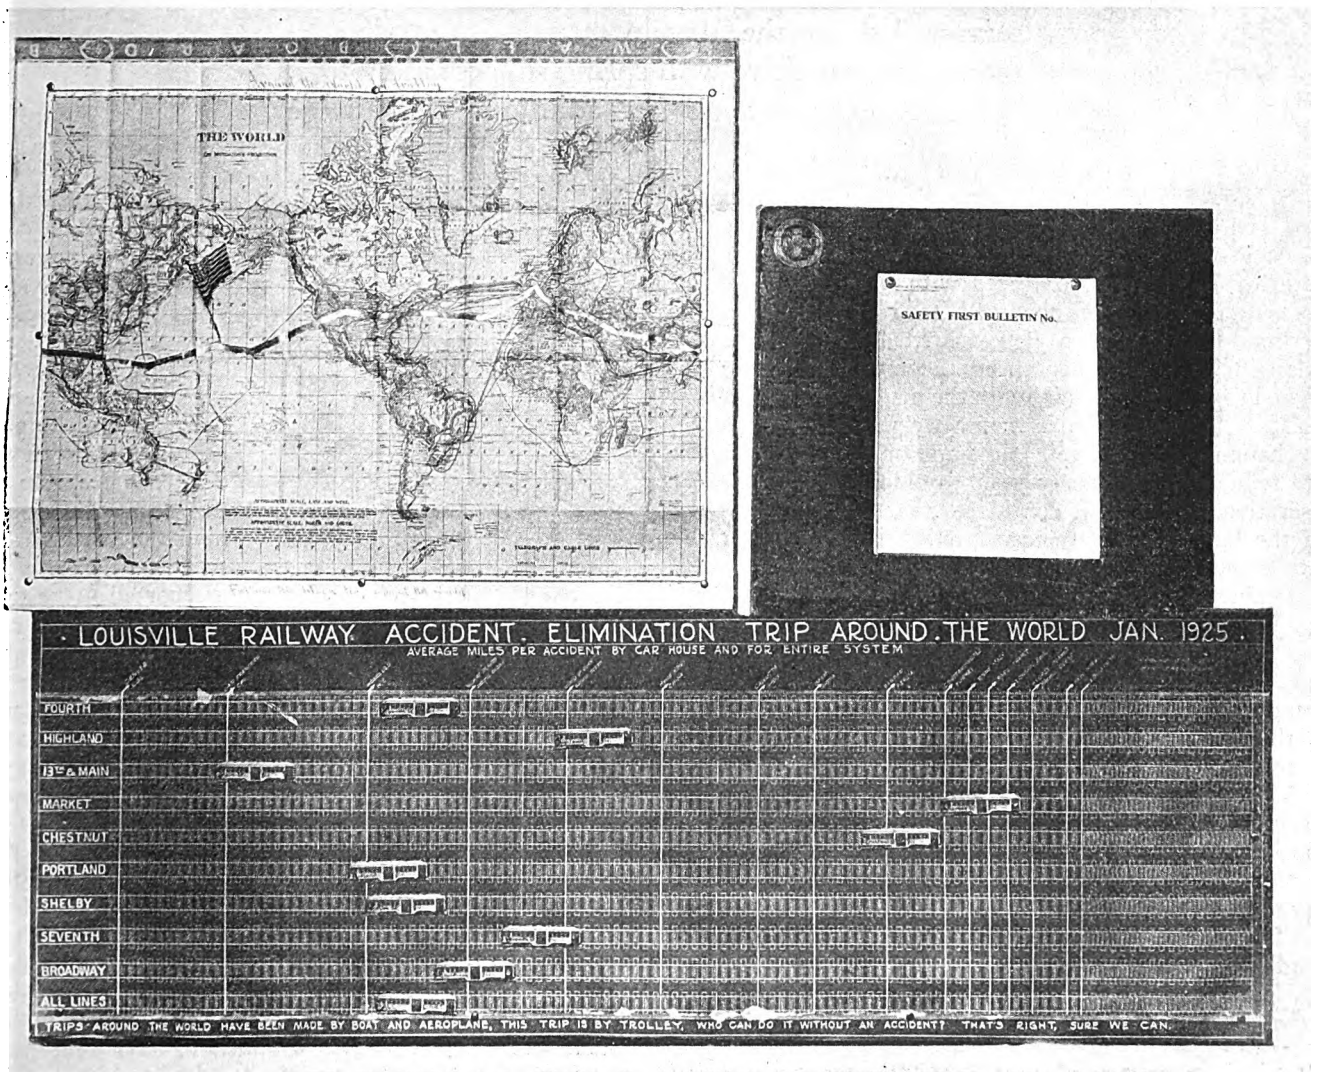
Another feature of the company's safety policy is to vary from time to time the method of indicating the day by day standing of the contestants. This keeps up the interest. A recent method is shown in an accompanying illustration. It is known as the "Around the World Safety Trip." It was originally used in 1925 but was continued well into 1926.

A map of the world, girdled to show the route to be followed, was posted in the carhouse on the theory that any carhouse which operated an average of 25,000 miles per accident would succeed in encircling the globe in safety. Below the map was a blueprint showing the records of the different carhouses, with a representation of a car on each horizontal line to indicate the standing of that division. Bulletins based on the world trip idea were issued during the month to stimulate interest in the contest. Thus one bulletin would say that a carhouse unit "had reached Hong Kong, where great care in operation was necessary on account of dense traffic," or that it had come to Bagdad which was "a long way from home, but if you keep your mind on your business, we can make this trip."

In the fall of 1925 an anonymous director of the company offered an annual cash prize of $75 and a gold medal to the employee who during each calendar year rendered in his individual capacity the most efficient or useful service to the public. To this prize the company added another to go to the same individual of a trip to that year's A.E.R.A. convention.

For 1925 the prize was awarded to a conductor who had expended an enormous amount of energy and his own time upon safety work. For 1926 the prize was given to a motorman who had avoided injury to a child through extraordinary precautions.

A number of other features of the safety program of the company have been worked out carefully, but no attempt is made to enumerate all of them here because of the lack of space. A few words should be said, however, on the results.



A hypothetical trip around the world is conducted monthly to encourage individual carhouses to make at least 25,000 miles per accident

In the first place, the campaign has undoubtedly increased the good will of the people of the city toward the company. They cannot but know about what is going on because of the publicity given to the monthly dinners to the men and to other events. With this good will has come also a greater realization by the public of its obligation to take safety precautions.

There have also been notable reductions in expenditures in settlements for accidents, in spite of increased car mileage and motor vehicle registration. Some of these are shown in a table published in this week's issue on page 148.

Double-Reduction Motor Drive with Spring Suspension

By C. Bethel
Manager Railway Motor Engineering
Westinghouse Electric & Manufacturing Company

Demands for more rapid and attractive street car service led to the development of the double-reduction gear drive with spring supported motors. Oil-tight gear case is an additional advantage

REMARKABLY quiet operation has been obtained with a double-reduction gearing, known as the W-N drive. It has made possible a maximum gear ratio of 10 to 1, as compared with the ratio of single-reduction gearing of about 3½ to 1. This of course permits the use of a light-weight high-speed motor. Along with this higher speed the motor has been designed to reduce to a minimum the magnetic and windage noises. Since the entire motor weight is spring-borne, the hammer blows at rail joints and on special trackwork are reduced, which also assists in obtaining quietness of operation. When it is considered that today noise is one of the least desirable characteristics of a street car the importance of these features is evident.

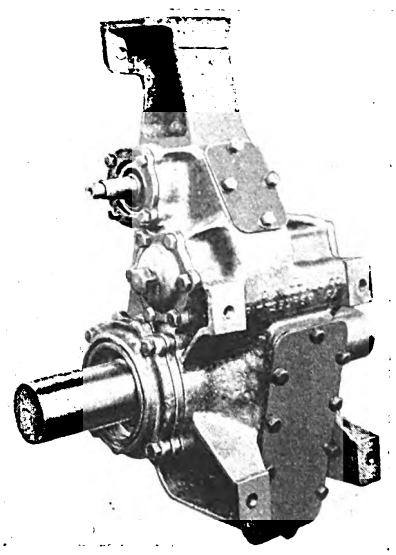
Timken roller bearings are used throughout. With them it is possible to maintain gear centers with accuracy and to ensure that the gears will mesh along the pitch line. Helical gears are used, the face and the helix angle being chosen so that three teeth are always in contact at the pitch line. This insures quietness and freedom from vibration.

A further increase in the gear life is assured by enclosing the gear case so tightly that the gears may be run in an oil bath. This answers the demand of a number of progressive operators, who for a number of years have seen the need for an oil-tight gear case.

The original W-N drive, in experimental form with single-reduction gears, was placed in service in Wheeling, W. Va., in November, 1925. The present W-N drive differs from the original mainly in that double reduction gears are used. This gives a maximum road clearance.

The gear case is a rugged one-piece casting. A split gear case, which would permit more ready assembly of the parts, was not used because it would reduce the stiffness of the gear unit and would add joints that would have to be kept tight. While one of the gears or gear bearings might be removed more quickly were the gear case split, the unit construction requires a less frequent gear removal. The unit can be assembled on an axle without disturbing any of the gears or bearings, and the assembled unit may be put on or taken off the axle just as readily as an ordinary gear.

The entire motor is spring supported, and approximately half of the weight of the gear unit is spring borne. The assembly of truck with motors and gears has an extremely low unsprung weight. The motor is mounted on trunnions and is connected to the gear unit by an extra heavy-duty flexible coupling or universal joint, designed especially for railway service. The trunnions are connected to swing links supported from a member extending from the truck transom to the cross-member behind the wheels.

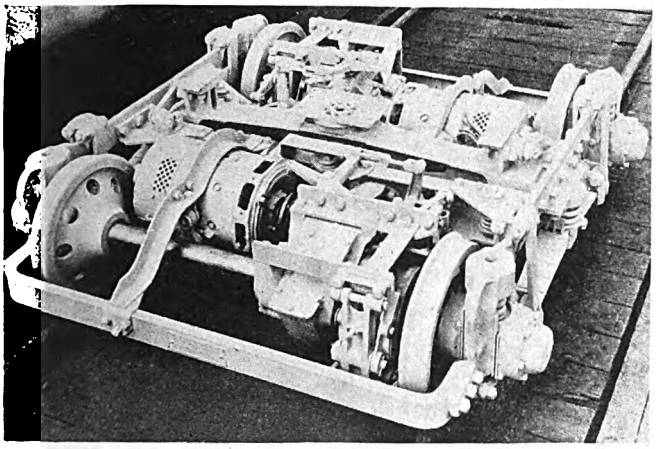


New Westinghouse W-N drive unit for light-weight, low-floor cars

The gear unit is supported on the axle through two tapered roller bearings and on the other side to the truck transom. Thus the motor and about half of the gear unit are spring suspended. The universal joint and the trunnion swing links provide for the slight movement of the pinion shaft relative to the armature shaft. In addition, the universal joint is flexible torsionally, which gives further protection to the motor and gears from the driving forces. This makes the mounting completely flexible both as to suspension and drive. This is quite important. Most railway motor troubles are either directly mechanical or have a mechanical origin. Such troubles are broken leads, chafed coils, loose coils, worn and broken bearings, poorly meshed gears, gear vibration, chipped and broken brushes, and loose parts. The flexibility of this mounting and drive greatly minimizes the forces tending to cause trouble of this nature.

There has been a definite trend in motor design toward lighter weight. This trend is illustrated in an accompanying graph, where the weight of the motor complete with gear and gear case is plotted against one-hour horsepower. Curve A shows the weight of the old line of split frame motors. Curve B shows the modern box frame, axle hung motors. Curve C shows the new line of motors for W-N drives. A similar set of graphs shows weight plotted against tractive effort at the one hour rating. Table I gives another illustration of the trends in design.

Digitized by Google



The W-N drive and No. 1425 motor applied to truck of light-weight car

The average weight of representative motors, including gear and gear case, is 67.4 lb. per horsepower for the split frame motors, 42.7 lb. per horsepower for modern box frame motors and 28.3 lb. per horsepower for the W-N drive motors. These compare with the weight of three modern European motors designed for Cardan shaft drives of 31.5 lb. per horsepower without gears, couplings, or driveshaft. The remarkable lightness of the modern W-N drive motors is due to high speeds, improvements in ventilation, class B insulation, and to the use of 300 volts per motor, two motors being connected in series on 600 volts.

An unusual feature of the motors is that they are designed to run two in series on 600 volts. Everyone who has had experience with light-weight, high-speed motors with 600 volts per commutator realizes the advantages of reducing this to only 300 volts. Where the space is restricted and the diameter is small the commutator bars must be very thin when an adequate number for 600 volts are used. The distance between brushholders is also short. With 300 volts per commutator fewer bars are required and a better mechanical structure results; the volts per inch of periphery are cut in two. Hence flat spots, poor commutation and flashing should be practically eliminated. The use of 300 volts gives a larger motor rating for a given weight and space, and the machine is much more stable electrically and rugged mechanically.

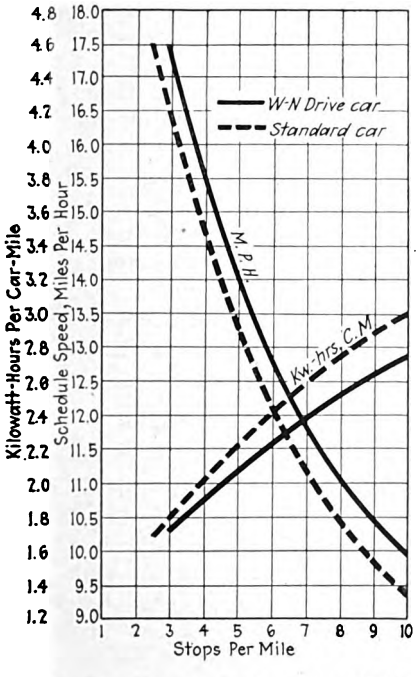
There are several reasons why 300-volt motors of the axle-hung type have not been used. Until recently a fairly large part of the cars purchased had two motor equipments. It was more economical to have a motor to serve for both two- and four-motor equipments. Motor speeds suitable for the standard single reduction gearing are not beyond the range of reasonable 600-volt design, and commutators are large enough to operate safely on 600 volts.

The last two reasons hold for all standard axle-hung motors with the possible exception of the 25-horsepower size, which is just about at the limit of good design from the standpoint of commutation and flashing. In fact, it sometimes has appeared that safe limits have been exceeded.

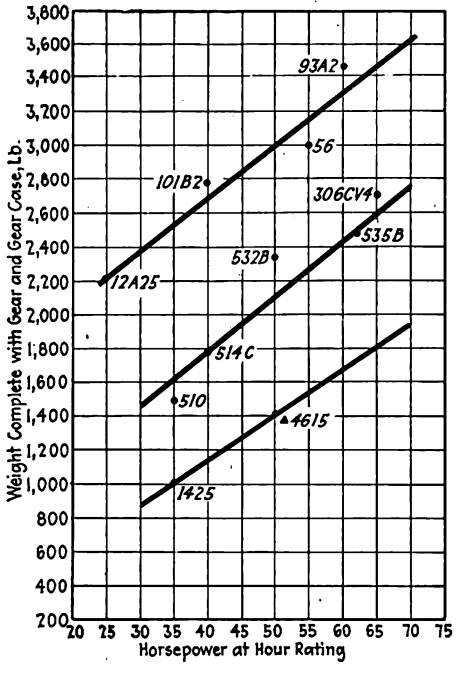
With the development of high ratio gearing for other purposes, efforts were made to take advantage of it in the motor design. Since gear ratios up to 10 to 1 are entirely feasible, this ratio was used as the basis of investigation. It soon developed that it is easy to build a 35-hp. motor that is adequate mechanically to operate at the speeds required for this gear ratio. But it also developed that the commutator of a 35-horsepower motor running at such speeds is smaller even than the commutator for the standard 25-horsepower machine.

The electrical stability of a motor depends on number of commutator bars, volts per inch of commutator, and commutator speed. In a high-speed 600-volt motor either the number of commutator bars must be seriously reduced or the bars made quite thin, and the volts per inch of commutator and the commutator speed are seriously increased. For 300-volt motors the mechanical strength of the armature limits the armature speed. Electrically the 300-volt motor is very stable.

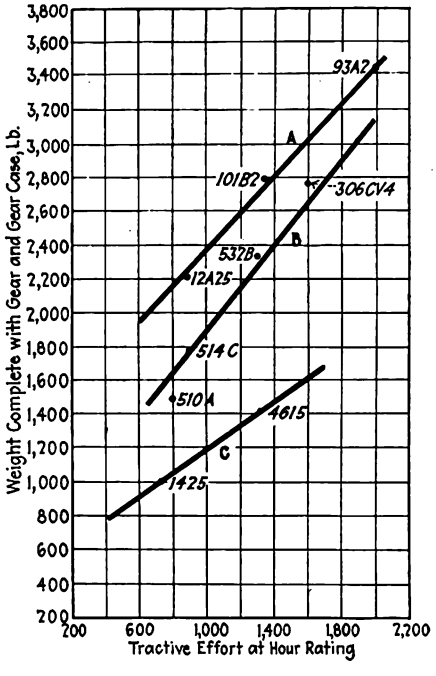
The type 1425, 300-volt motor developed for the W-N drive is insulated for 600 volts. Full line voltage, due to a ground in one of the motors of a pair, or to severe



Operating characteristics of new W-N driven car and standard car



Trend in design of lighter motors per horsepower



Trend in design of lighter motors per pound tractive effort

Digitized by Google

wheel slippage may be applied without damage. While such conditions may cause flashing sometimes, it is not the occasional flash that runs up the maintenance. It is the continued flashing of the same motor. Furthermore, there is a great difference in the effect of a flash on a 300-volt motor as compared with a 600-volt motor. The small, high-speed 600-volt motor is very sensitive to flashing and the commutation is none too good. When a flash occurs the commutator may be roughened slightly. Owing to the inherent instability this provokes one flash after another, until a definite flat spot is started. Once a flat spot is developed the only cure is to turn the commutator.

When a flash occurs in the 300-volt motor any slight burning of the commutator is not nearly as likely to cause another flash because of the inherent stability of the motor. The commutator has a fair chance to take on a polish and free itself of further danger of flashing. The 300-volt motor is, therefore, much less subject to flashing, but the flashes that do occur are not nearly as likely to result in a repair job as a flash on a small high-speed 600-volt motor.

The conductors of 300-volt motors are twice the size of those of corresponding 600-volt motors, providing a more substantial armature winding and affording better seats for the bands. The problem of broken leads is less serious with the larger conductors. The substantial armature construction and improved commutator design permit of high peripheral speed. In the smaller sizes the 300-volt motor permits a more economical use of materials. Other things being equal, the 300-volt motor is lighter than the 600-volt motor.

The successful operation of the Springfield and Joliet cars with two Westinghouse motors in series on 600 volts, and the high accelerating rates obtained in the tests of the car with W-N drive, indicate a freedom from slipping of wheels. Similar successful results with 600 and 750-volt motors in series on 1,200 and 1,500 volts confirm the same thing.

European Experience Valuable

While railway problems in Europe differ materially from those met with in this country, certain aspects of European experience furnish a valuable guide for American development of new street car drives. Various kinds of street car drives have been experimented with in Europe for the last six or seven years. The motors used do not differ materially in weight efficiency from those of the standard axle-hung type used in this country. The average weight of representative motors, without gear and gear case, is 38.1 lb. per horsepower for domestic box-frame motors, 31.5 lb. per horsepower for European Cardan drive motors, and 15.5 lb. per horsepower for the W-N drive motors.

The principal reason for this great difference in motor weight is the almost universal use of two-motor equipments in Europe. This compels the use of 600-volt motors. One prominent European manufacturer states that full advantage cannot be taken of the higher gear ratios possible with the new drives because of the limitations of 600-volt design. In spite of this the new types of gear drives have made great progress in Europe. The most common type is the bevel gear drive developed in Paris. More than 500 cars equipped with this drive are in service. There also are a number of double reduction spur and bevel gear drives, some double reduction spur gear drives, and a few worm drives in service in Europe.

Use of the single-truck car has also influenced the gear drives used in Europe. Practically all of them are connected to the motor through a Cardan shaft perpendicular to the axle, so that the designer can place the motor where there is the most room for it. It would be quite difficult to place the large motors used parallel to the axle similar to the mounting with the W-N drive.

TABLE I—WEIGHTS PER HORSEPOWER FOR VARIOUS MOTORS

Type	Horsepower	Volts	R.P.M.	Weight Complete With Gears and Gear Case	Pounds per Horsepower
12-A-25	25	500	515	2,200	88.2
101-B-2	40	500	520	2,780	69.5
56	55	500	500	3,000	54.7
93-A-2	60	500	510	3,440	57.3
510-E	35	600	1,070	1,475	42.2
532-B	50	600	665	2,325	46.5
535-A	60	600	770	2,400	40.0
306-CV-4	65	600	700	2,750	42.3
1425	35	300	2,100	1,000	28.6
1426	50	300	1,650	1,400	28.0
S.S. D340	50	550	1,300	1,320*	26.4*
A E G	45	....	820	1,650*	36.6*
Paris	50	550	800	1,584*	31.7*

* These weights do not include gear and gear case.

The principal reason for the development of these new drives in Europe is to reduce maintenance cost. Gears mounted in oil and dirt-tight gear cases have a much longer life than with the old type of mounting. These drives permit the motors to be spring suspended, which reduces the motor maintenance. No great reductions in dead weight have been made. It appears that no special emphasis has been placed on noise reduction, perhaps because in Europe the old cars were much quieter than cars in this country.

Ability to maintain high schedule speeds is of greatest importance. High accelerating and braking rates are the principal factors in obtaining this end. Ample capacity of electrical equipment for the weight of car handled is essential if high maintenance expense is to be avoided. The type 1425 motor with W-N drive on a car loaded to 33,000 lb. made very unusual records of accelerating and braking. Rates of 3 m.p.h. per second were obtained without difficulty and several values of between 4 and 5 m.p.h. per second were recorded during the tests. Paraphrasing the automobile advertisements, the average car will not be expected to make these rates in every-day service, but the ability to perform is present and may be called on in emergency. These high accelerating rates are possible because of the high efficiency of the drive and the ample motor capacity.

Another factor which assists in maintaining high schedule speeds is ease of passenger interchange. Low floors are most important to facilitate the boarding and alighting of passengers. The type 1425 motor with W-N drive allows 22 in. wheels to be used with 1 in. greater clearance than was formerly obtained with 26-in. wheels. This permits a low car floor with only two steps of moderate height from the ground, without ramps, which increase the cost of a car and are an accident hazard. The low floor also adds to the beauty and attractiveness of the car body.

Low Operating Cost Indicated

Operating costs should be decreased with the new type of equipment. It is light in weight, the starting resistance is low, the gears are efficient. All these factors result in low energy consumption. High schedule speeds make it possible to give a specified service with fewer cars, and at reduced labor costs and fixed charges per car mile. Maintenance costs should be low because of the low unsprung weight, the simplicity of the equipment and operation of the gears in a bath of oil from which foreign matter is excluded.

Philadelphia Tackles Its

Street Congestion Problem

Extensive publicity campaign carried on by Philadelphia Rapid Transit Company during November and December brought public appreciation of the real causes of traffic congestion and consequent delays. Elimination of taxi cruising a major accomplishment

"GIVE the 80 per cent a square deal" has been ringing through the highways and byways of Philadelphia during the late fall and early winter. Signs in the street cars, advertising spreads in the newspapers, speakers before civic associations, thousands of direct-mail contacts with automobile owners and other citizens—all of these media and more have been employed by the Philadelphia Rapid Transit Company to bring home to its passengers and to other users of the streets, the crying need for relief from traffic congestion.

Every large American city has its case of downtown congestion, with principal and minor traffic arteries "hardening" in a manner alarming both to patient and to the experts in attendance. But nowhere is the problem more serious than in central Philadelphia, where the arteries are so narrow as scarcely to be more than capillaries. Almost universal one-way operation throughout the downtown section was adopted many years ago; parking has been prohibited on many of the more narrow streets, yet today the P.R.T. is finding it increasingly difficult to get its cars through the down-town sections of the city on schedules even approaching those of a few years past.

To follow this trend to its logical conclusion would be to invite utter stagnation of all traffic, whether it be on rails, on rubber, or trailing behind old Dobbin. Those who have studied the traffic situation in Philadelphia, and indeed anywhere, realize that there is no real cure for congestion, save by providing vastly augmented highways and street space, by placing surface street car lines underground and, in general, spending great sums of money for sweeping engineering developments. Even then, the surface might soon be as crowded as before.

It is one thing grandly to suggest such moves as these; it is another thing to carry them out. Time, money and public education are required. In the meantime something in the nature of an antidote must be given the patient, if he is to live for future diagnosis. That antidote, as conceived by the P.R.T. and recommended to the people of Philadelphia by widespread publicity and advertising activity, is greater care in the use of the streets. The campaign is not one for bigger and better laws, or for more rigid enforcement of those already in existence. It is rather an appeal to the common sense of all classes of street users. It is of no avail to tell the automobilist that he should not expect to park on narrow streets and that he should not drive on the street car tracks, unless he can be shown that those selfsame tactics delay himself and his fellows every time he sits behind his steering wheel.

Cartoons like this in the "P.R.T. Co-operator" helped to carry the message over

P.R.T. has arisen as the champion of the car-rider—the fellow who, as a composite whole, is numerically entitled to 80 per cent of all the street space, yet is grudgingly accorded about 10 per cent of the space by the privately owned and commercial vehicles which monopolize the balance of the space available.

Action Not Entirely Unselfish

Perfectly true that the transportation company is serving its own ends by focusing public attention upon the traffic problem. Dislocated schedules always make the red-ink bottle perk up with anticipation. Delayed cars mean disgruntled passengers and these individuals cause thinning locks in the public relations department. The local newspapers, in commenting upon the "80 per cent" campaign, have cheerfully pointed out that the P.R.T. has a weather eye cocked leeward during all of its

Digitized by Google

vocalizings and visualizings for the benefit of the people. They have none the less been unanimous in supporting the campaign as a worth-while civic movement, regardless of how interested or disinterested may have been the motives which inspired it.

The 80 per cent of street users who are car riders in Philadelphia are, like all majorities, inarticulate except in rare instances when something succeeds in awakening a group consciousness among them. Lest this something be a super-demagogue, inspiring the public to blind and unreasoning attacks upon the transit company, P.R.T. has felt the money well spent in laying its cards frankly upon the table and explaining just how, when and why delays in service are caused.

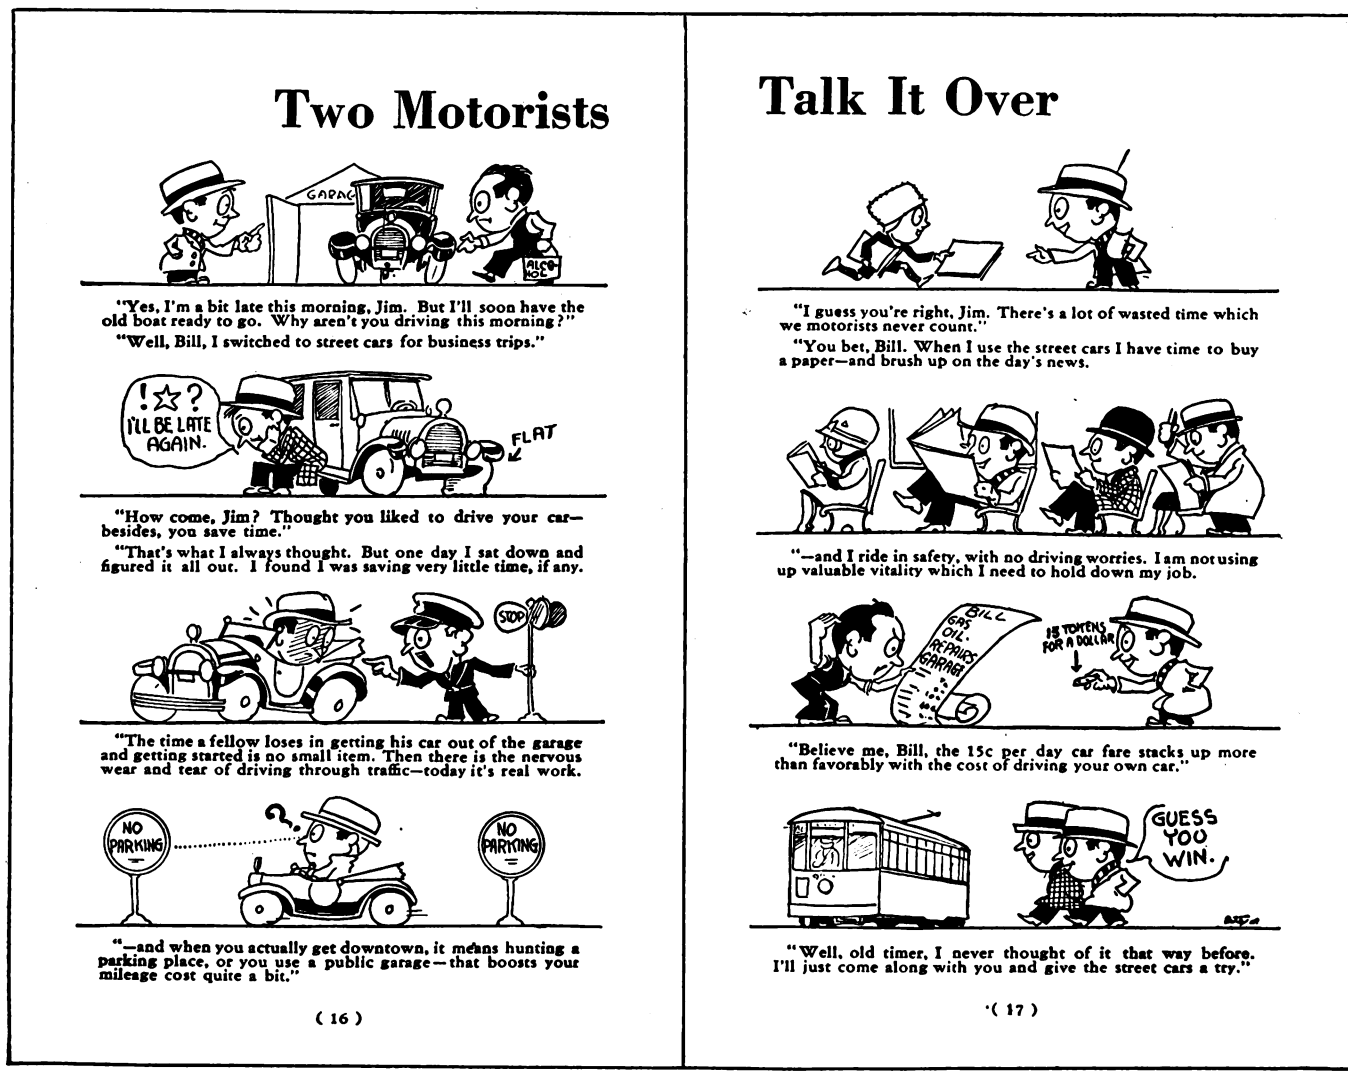
At no time throughout the year is there greater need for a sympathetic understanding between agencies of public transportation and their patrons than during the month and a half just preceding Christmas. The ideal Christmas presents seem more difficult than ever to locate, their cost is all out of reason, the crowds are impossible, nerves become badly bent, even if they do not break, and then the street car gets caught in a traffic jam down the street somewhere and Mr. and Mrs. Shopper stand on the street corner with a realistic picture of a cold supper forming in their minds.

This season P.R.T. was more fortunate than in the preceding year, for no serious snowfall occurred during the peak of the Christmas rush. In 1926 every delay in service was charged to the company, and an agitation developed which eventually led to an investigation by the Pennsylvania Public Service Commission. The result of that investigation was to give the company a clean bill of health and to fix the responsibility squarely upon the bad traffic conditions existing in the city.

This slogan in a circle was carried in all advertising and on the cars and buses

The memory of the public is short-lived, however, and so it was that the slogan, "Give the 80 per cent a square deal," was created. Entirely aside from its practical results in helping to minimize some of the causes of street delays, it has brought home to the car rider that the problems of the transportation company are his own problems as well. As a result, practically no charges have been voiced this season to the effect that P.R.T. has deliberately allowed its service to become impaired, for whatever reason. Rather, the efforts of the company toward clearer streets have met with universal commendation and public-spirited organizations throughout the city have not been slow to go on record as being thoroughly in accord with its aims and purposes.

Experience with previous campaigns had shown P.R.T. that the degree of success attained would depend almost wholly on the extent to which a single key phrase or thought could be instilled into the public consciousness.



The 17-page pamphlet "Thoughts from the 80 per cent to the motorist," distributed generally, carried this effective story

Digitized by Google

Hence the "80 per cent" idea was selected. It was woven into every message presented through the newspapers, on the cars or by word of mouth, from the opening broadside early in November up to the present time. It is expected that the campaign will continue to the end of January.

As a result of this publicity the car riders began to sit up and take notice, realizing perhaps for the first time just how numerically important a group of street users they actually were. After a few weeks a man in the street could be heard bringing "the 80 per cent" into his conversations at frequent intervals. Then the quipsters and columnists took the phrase to their respective bosoms and the success of the campaign was assured beyond peradventure.

Important among the appeals to enlist the citizenry of Philadelphia in the movement to reduce street congestion were the following:

A series of advertising messages which were given staggered insertions in all of the large daily newspapers.

"Read-as-you-ride" folders which were given system-wide distribution in boxes provided on the street cars, buses, elevated trains and stations and in the yellow cabs operated by P.R.T.

Dash, bulkhead, ceiling rack signs and cab cards displayed throughtout the system.

Advertisements with special community appeals inserted in the small community newspapers scattered throughout the city.

Direct mail and personal appeals to civic associations to enlist their active support in the campaign.

A special booklet entitled "Thoughts From the 80 Per Cent to the Motorist," distributed to every registered automobile owner in Philadelphia.

Press releases sent to city and community papers, supplementing the advertising insertions and covering such subjects as the actual causes of delays in street car service during the month of November, the particular causes of traffic delays on routes serving specific communities, etc.

From the illustrations which accompany this article it may be seen that the appeal was directed principally in two directions. In other words, both the 80 per cent and the 20 per cent of street users were asked to bend their own effort toward greater freedom of traffic movement. It was pointed out to the car rider that he, himself is not guiltless in the matter of causing needless delays, since his ramblings as a pedestrian and his peccadilloes as a passenger have been known to cause no small amount of confusion upon many occasions. Yet the greatest responsibility for making a wise and effective use of the streets must be placed squarely up to the autoists, fleet owners, and other persons whose vehicles enter the downtown section.

One of the pamphlets given city-wide distribution contained a number of sketches showing a few of the more common causes of street tie-ups. Among these were all-day parking, unloading coal wagons, motor accidents, snowstorms, construction work, accidents, synchronized traffic control, unloading trucks and delivery wagons, and railroad crossings. Quite obviously it would be futile even to hope wholly to eliminate these particular bugaboos from the picture. But it was the plea of the transportation company that the various items be considered in a light of reasonable common sense, with a view to minimizing their effect upon the flow of traffic.

For example, the heads of Philadelphia's large coal supply companies were asked to consider the possibilities of making all downtown coal deliveries in other than peak traffic hours. Merchants with large delivery fleets were similarly requested to co-operate in the prevention of tie-ups due to the downtown parking of their vehicles.

As an earnest of P.R.T.'s own sincerity in the campaign, explicit instructions were issued to the drivers of all cabs and buses operated by the company to the effect that driving on the street car tracks, except when absolutely essential, would be strictly taboo. Employees of the transit company proved more than willing to co-operate in the movement, particularly after a special issue of their employee organ, the *P.R.T. Co-operator,* had explained in detail the purpose and aims of the traffic campaign.

P.R.T. gave the further assurance that all track construction and repair work in the central congested area would be carried on during the night hours, except in cases of emergency. But this was by no means the greatest contribution made by the company to the cause of traffic relief.

No-Cruising Plan for Cabs Was a Major Step in the Campaign

On Dec. 12 the first no-cruising plan for taxicab operation to be adopted in any American city, was initiated in Philadelphia. Under its provisions the various cab companies in the city agreed to prohibit all cruising for fares in the downtown district. Many additional cab stands were provided throughout the central area, there being, as a general rule, a stand behind every trolley stop. The two smaller cab companies were purchased by the Yellow Cab Company, owned and operated by the P.R.T. This left but two major cab organizations in the field, Yellow and Quaker City.

One of a series of newspaper advertisements telling the story

It was agreed that all cab stands should be open to any cab operators, including independents, having a certificate of convenience by the Public Service Commission. Telephones are provided at most of the stands, for the use of Yellow and Quaker City dispatchers in controlling the movements of their respective fleets and also for the convenience of prospective cab passengers who may desire to summon a cab when one is not present at the stand.

Digitized by Google

The no-cruising plan, unique in every aspect, was developed after months of careful consideration by a committee appointed by the Public Service Commission and representing the various cab operators in the city. Its purpose, of course, was to do away with that fertile source of traffic congestion, the cruising cab. Incidentally it was expected that the reduction in "dead mileage" on the part of cabs in the downtown section would effect a very real economy in operation for the larger fleets.

Coming at the time it did, the no-cruising plan dovetailed perfectly with the "80 per cent" campaign of P.R.T. and was the greatest single contribution of that organization to the civic movement which it was sponsoring. After an initial period of a few weeks, during which time the various wrinkles of the undertaking were ironed out and the cab-riding public educated to the necessity for "walking half a block for a cab," the plan seemed destined for unqualified success.

Co-operation from Civic and Industrial Organizations

A large number of civic associations, business men's organizations and similar groups passed resolutions commending the "80 per cent" campaign and urging upon city authorities, public utilities, autoists, fleet owners and other persons vitally concerned with the problem of traffic congestion, a careful study and wholehearted co-operation with the movement. The Westinghouse Electric & Manufacturing Company gave valued assistance by placing two of its institutional traffic congestion advertisements in Philadelphia papers during the course of the campaign.

Many fleet owners and others whose aid was solicited by direct mail appeals and by personal contacts responded in gratifying fashion and promised to tackle the traffic problem squarely, so far as their own activities were concerned. The essential logic of the proposition as pictured by the transit company appealed to common sense of other individuals and groups concerned, they being able to realize the economic loss which they themselves are suffering from ever-increasing street delays.

As a result of its experience with this most recent advertising and publicity campaign the Philadelphia Rapid Transit Company is more firmly convinced than ever that institutional and good-will advertising should embody features which reasonably may be expected to effect a saving in operating expense or an increase in earnings. The result in the present case, of course, is to speed up service through the reduction of costly operating delays.

When, as in the case of the "80 per cent" campaign and that of the "Will Livelong" safety campaign conducted by P.R.T. in the spring of 1927, good will may be built up simultaneously with a dollars-and-cents return from a reduction in operating delays or a saving in damage suits, the advertising appropriation is felt to have attained its maximum of usefulness.

Flat Car-Trailer Equipment Successful on South Shore Line

PRELIMINARY reports indicate that the flat car trailer equipment recently added to the merchandise dispatch service of the Chicago, South Shore & South Bend Railroad, Michigan City, Ind., have proved a marked success. Adopting the plan of its sister road, the Chicago, North Shore & Milwaukee Railroad, which was the first electric interurban line in the country to establish this type of door-to-door freight service, the South Shore Line is now operating between Kensington, Ill., and South Bend, Ind., three steel flat cars, accommodating three 15-ton truck trailers each. Three heavy-duty tractors are being used to haul the trailers from the company's various receiving depots in Chicago to Kensington and from all sections of South Bend to the local terminal yards where the trailers, with wheels still attached, are lifted bodily on to the flat cars. Overnight delivery is promised to users of this service, which is now offered only between the two terminals.

Work at the new South Bend freight station of the South Shore Line, which will be used to receive and distribute merchandise dispatch, is expected to be completed early in February. The new depot will be a steel and wood structure, 28 ft. x 120 ft., with a 9-ft. loading platform and complete freight office facilities.

Electric Railways to Climb the Pyrenees

CONSTRUCTION of an electric railroad between France and Spain across and through the Pyrenees Mountains is now under way. This line will connect the Midi Railroad of southern France and the Spanish railroad system that joins Barcelona with Madrid and other important cities. The electrified Midi Railroad runs through the southern part of France, sending branch lines to the northern edge of the Pyrenees Mountains. On the Spanish side are railroads with branches that approach the range, but go no farther toward France.

One of the plans which has been brought to the stage of construction is to connect Toulouse with Barcelona in a fairly direct route. Farther to the west a line is being built from Pau on the Midi to Jaca, the terminus of a Branch line Spanish railroad. The French part of the Pau-Jaca line will be electrified because of the numerous tunnels, the curves of approximately 650-ft. radius and the almost continuous grade of 4.3 per cent. The electrification will be divided into two sections, one from Pau to Bedous, the other from Bedous to Canfranc. The first section has been completed, but is operated as a steam road at present. Power for this section will be furnished by three substations equipped with 750 kw., 1,575-volt, direct-current sets, each set comprising two rotary converters in series.

The second section has two substations, in each of which are to be two 2,000-kw. sets, consisting of two rotary converters in series. These machines, which were built by the French Thomson-Houston Company, are compound excited with a special winding to allow regeneration by the locomotives. This winding modifies the characteristics of the machine in reverse operation and permits the regeneration of energy with but a small increase of voltage at the substation bus. The rotaries will be capable of 50 per cent overload for two hours. The two substations will be fed by three-phase, 50-cycle, 6,000-volt power from the central station of the Société d'Energie Electrique de la Vallée d'Aspe.

For centuries the high wall of the Pyrenees has stood between France and Spain, discouraging intercourse between them. Only where the Pyrenees fall off at the seaboard can railroads pass without difficult problems of engineering. More direct routes between the important cities have been sought and many years of study have been given to the subject.

Third Avenue System Prepares for

Bus Service in New York

Contracts have been signed for the operation of twelve routes, covering the Borough of the Bronx. With the old routes of the same company this will make more than 100 miles of bus lines. Orders are placed for 104 buses of several types

IN CONJUNCTION with the approval by the Board of Estimate and Apportionment of New York City of plans and specifications for buses to be operated in the Borough of the Bronx by the Surface Transportation Corporation of New York, President S. W. Huff of the Third Avenue Railway System, with which the bus company is affiliated, has announced the company's plans for bus service under the franchise award.

More than $1,000,000 will be expended on four different types of buses required to meet the needs of the borough. Contracts have been made with the Six-Wheel Company, calling for 26 double-deck, and 36 single-deck buses of the six-wheel type; with the Versare Corporation for 28 six-wheel gas-electric buses of the single-deck type; and with the American Car & Foundry Motors Company, for 14 single-deck buses of the dual-wheel type. The work of manufacturing these buses is already under way, and they will be put in service as delivery is made.

With the inauguration of service by the Surface Transportation Corporation in the Bronx, more than 100 miles of bus routes will have been added to the Third Avenue Railway System. The system has acquired and is already operating nearly 50 miles of bus routes in Westchester County, including the White Plains-Yonkers line, the Harrison-Rye Beach line, the Mamaroneck Avenue line, the White Plains-Tuckahoe line, the Silver Lake line, White Plains-Hastings line, and White Plains-Grassland line. The new Bronx lines will add 55 route-miles to the system.

Plans for garage and shop facilities to take care of the new fleet of buses are under way. Equipment of a large repair shop has already been started on company property on West Farms Road near 172nd Street. All maintenance and repair work will be done at this location. Actual operation will be out of two garages, one on the east side of the Bronx and one on the west side. The east side garage, recently purchased, is situated at 173rd Street and West Farms Road. The details of working out an operating force are also well under way, drivers, conductors, and a maintenance force now being in training.

Fare on all lines will be 5 cents with universal free transfers between all bus lines, with the exception of the two Concourse lines, where there will be two 5-cent

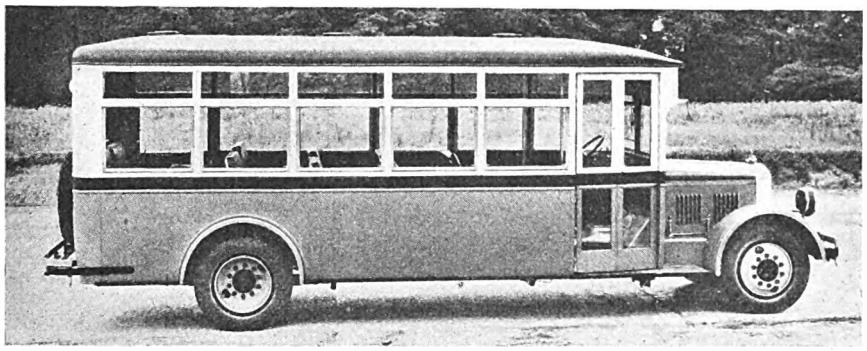
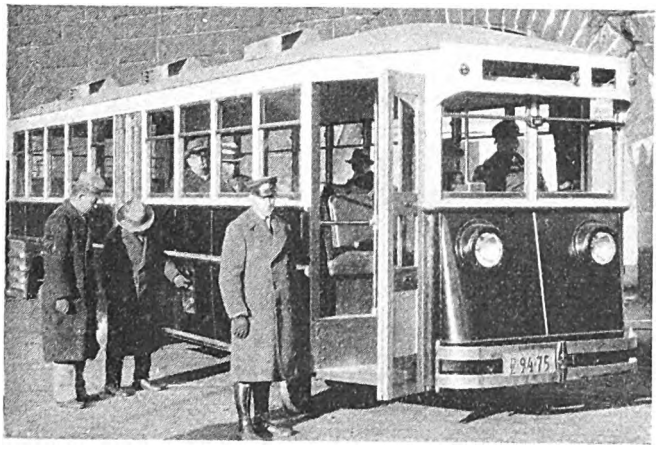
Style of six-wheel single-deck coaches for Third Avenue system



Type of dual-wheel coaches for Third Avenue system



Vice-President William E. Thompson and other Third Avenue men inspecting Versare bus at the railway's offices

zones, and the two City Island lines, on which there will be three 5-cent zones.

According to Mr. Huff, the types of buses contracted for were selected after careful study as best adapted for modern, safe and efficient metropolitan service. All the bodies are of special design, and comprise many features that have never appeared before in urban service in this territory. The six-wheel type of bus, while new to New York urban operation, has been thoroughly tested and is in general operation in other cities, notably Detroit, Cleveland, Kansas City, St. Louis and Akron. All the coaches will be equipped with powerful six-cylinder engines and pneumatic tires.

The double-deck coaches will be equipped with comfortable seats with springs and real leather upholstering. The lower decks will be equipped with double seats and the upper decks with individual opera seats, as shown in one of the illustrations. The upper decks will be entirely inclosed when weather conditions require, and in summer wide windows will be lowered, giving the same effect as an open top. Heating systems will keep both upper and lower decks comfortable during the colder periods. Other features include dome lights on both decks, white enameled ceilings, and walnut trim with upholstery to match. By depression of the sides of the lower deck roof, full headroom is provided in the aisle on both decks.

An important safety feature of the six-wheel single deck buses is the automatic treadle step, which is being employed for the first time in the East. Passengers board at a front entrance and alight at the rear, insuring a free flow through the bus. The treadle step only operates when the buses are at a standstill with the brakes on.

The Third Avenue paint scheme of cream and red will be used throughout the system.

The several types of buses were selected after careful study with special reference to the service which they will be called on to perform. The Concourse, which is one of the principal north-and-south boulevards in the

Route	Name	Termini	Miles
1	Concourse—138th Street	Mosholu Parkway and Grand Concourse, East 138th Street and Mott Avenue	4.9

Digitized by Google

Bronx, is comparable with Fifth Avenue in Manhattan. For this reason the double-deck bus was selected, and the 26 buses of this type on order will be used on Concourse Routes No. 1 and No. 2.

On those lines where the load factor and the traffic were found heaviest, and frequent stops would have to be made, the 37-passenger gas-electric buses will be used on account of their capacity and rapid acceleration. On the lines where the runs are longer and the stops are less frequent the six-wheel 29-passenger mechanical drive buses were considered most appropriate. In the outlying sections which are under process of development the smaller 23-passenger buses will be operated. It was felt that with the wide range of conditions which must be met a single type of bus would not be suitable.

Prior to submitting the proposition for operation of the bus lines to the Board of Estimate and Apportionment the manufacturers and the railway management had agreed on the type of contracts they were willing to sign. The routes, termini and branch lines included in the contracts are given in the accompanying table.

Good Service Can Be Given at Low Cost

Experience in Fort Worth, Tex., shows that improved equipment gave lower operating expenses

GOOD service can be given at low cost. This has again been shown by the Northern Texas Traction Company, operating between Fort Worth and Dallas, Tex. In its Coffin brief last year it presented some figures and charts of operating expenses for the past six years. Since the presentation of that brief the company has forwarded later data for use in this article so that the 1927 data now are brought down to Oct. 1, 1927.

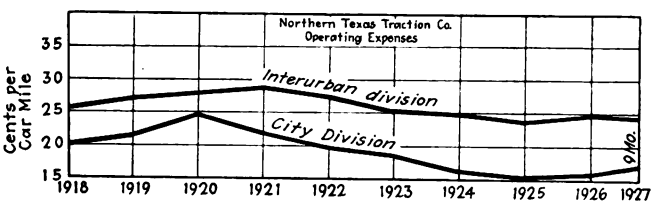
The first chart reproduced shows the operating expenses of the company from 1918 to 1927 inclusive, for both the interurban and city systems. As will be seen there has been a steady drop in expenses on both divisions since 1920.

During the summer of 1926 the company started a campaign for better service, which increased its operating costs slightly but added to its net earnings. It also brought many favorable expressions from the public. On the city division the actual decrease was from 24.6 cents per car-mile in 1920 to 15.9 cents in 1926 and 17.3 cents in 1927. These are decreases of 35.4 per cent and 29.7 per cent respectively.

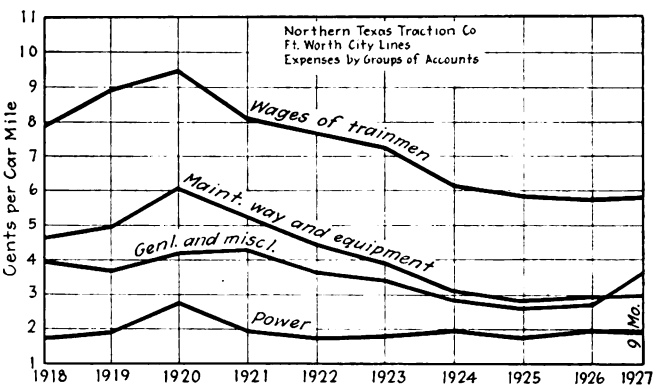
The period since 1920 has been one in which there has been no change in the wage scale. The entire saving through these years has been gained by means of modernization and the use of light-weight equipment. Operating costs have been reduced principally by:

(a) 100 per cent one-man operation on city lines.
(b) More than 80 per cent operation of city lines with light-weight cars.
(c) 13.1 per cent increase in speed of city cars since 1920 and 6.1 per cent since 1925.
(d) Inspection of all cars on mileage basis, with a decrease in cost as the system became perfected.
(e) Installation of labor-saving devices.
(f) Use of natural gas for fuel at the power house and a better form of contract through specification of price according to B.t.u. content.
(g) Modernization of cars and use of latest devices and fixtures.
(h) Education of employees, with resulting improvement in efficiency.

The second chart gives the cost of operating the city division by groups of accounts. It shows that the decline in operating costs since 1920 was consistent through all the groups up to 1927. The decline in trainmen's wages per car-mile continued through the year 1926, due largely to increases in the speed of the city cars, though revision of night schedules and changes on several lines during the day contributed to this low figure. Actually, the decreases were from 9.4 cents per car-mile in 1920 to 5.8 cents in 1926 and 5.85 cents in 1927, or decreases of 38 per cent and 37.6 per cent, respectively. As already explained, there has been no decrease in the wage scale



Nine-year chart of operating expenses on interurban and city division, Northern Texas Traction Company



Nine-year chart of primary operating expense accounts, Fort Worth city division, Northern Texas Traction Company

since 1920 and the company is operating 100 per cent one-man equipment.

Maintenance in 1926 and 1927 has shown a slight increase over the 1925 figure, but is still much lower than in any previous year. The increase over 1925 is caused by the improved service program already mentioned. The decrease per car-mile in this account, as compared with 1920, is 54.4 per cent for 1926 and 49.5 per cent for 1927. It does not indicate that a proper maintenance program has not been carried out, as during 1926, 13.1 per cent of the gross earnings was used for this purpose. The track and cars are considered to be in better shape than at any time in the history of the company.

The cost of power has remained steady since 1924. This is remarkable considering an increase in speed of 8.2 per cent over 1924 and 6.1 per cent over 1925 and an increase in the cost of fuel of 6.1 per cent.

The general and miscellaneous group shows a consistent decrease through 1925. In the latter part of 1926 and during 1927 considerable expense was incurred in establishing the new fare schedule, effective Feb. 7, 1927, in purchasing nickel passes and in several other ways which are not a regular charge to operation. Thus, after increasing its fare rates, the company decided to build up its accident reserve to a figure larger than that of several years past, and for a time prorated 4 per cent of gross to this account. The prorate was then reduced to 3 per cent, since this amount seemed to be sufficient to serve the purpose.

Maintenance Methods and Devices

Handy Sash Painting Stand

OF THE various devices that have been designed for painting window sash none has been found more useful than the rotating table. It has been reduced to its simplest form in the paint shop of the Twin City Rapid Transit Company, St. Paul, Minn., by Joseph Gabler, foreman. The table is formed of a heavy cross-braced plank with rubber blocks at the four corners and two additional rubber blocks mounted in between tor

A discarded barrel forms the base for this rotating sash painting stand

holding smaller sash. These rubber blocks hold a sash firmly in position when it is laid on top of the table, yet it can be lifted off instantly. The table has a length of 1-in. pipe fastened to its under side by an ordinary pipe flange. The standard is a discarded paint barrel, and the support for the pipe, in which the latter rotates, is a wooden block fastened to its top.

With the assistance of the stand the workman can paint all parts of the sash evenly, and there is no difficulty from the paint running over the glass. Since the stand and sash are rotated, the painter does not have to move while he is working, yet he does not have to reach over the sash. The sash can be reversed for painting both sides without the necessity of touching the freshly painted surface.

"Stop, look and listen" as your cars pass, then get busy on their maintenance.

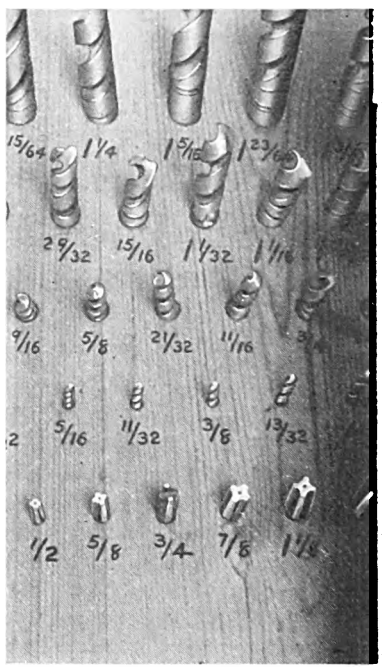
Salt and Sand Spreader

SALT and sand are spread along the bus routes of the Northern Ohio Power & Light Company, Akron, Ohio, with an ingenious spreader which was made in the company's shops. The mechanism is mounted on a Model 50 White chassis, cut down in length. The power take-off for the spreading mechanism is installed on the main transmission, and from the take-off an auxiliary touring car transmission is driven. A driving shaft is run from the latter transmission through standard universal joints to a Ford axle which is mounted vertically. On the lower end of this axle is installed a disk for throwing the salt and on the upper end is a steel wheel for agitating and breaking up the salt in the hopper. The hopper is made of 12-gage steel and has a capacity of 3½ cu.yd.

The salt feeds out of the hopper through two holes which are fitted with shutters that can be worked from the cab. By use of the auxiliary transmission any desired speed of the distributing cone can be secured regardless of the car speed.

Convenient Cabinet for Drills

BESIDE the drill presses in the Hall Street shops of the Grand Rapids Railway, Grand Rapids, Mich., a wooden cabinet for drills has been constructed. This is 3 ft. wide by 5 ft. high and has sloping shelves,



One of the sloping shelves in the drill cabinet

on which the different sizes of drills and taps used in shop work are kept. The doors can be locked so that there is no danger of theft during hours when workmen are not present. Figures underneath the various drills and taps indicate the sizes. This provides a neat arrangement convenient to the drill press.

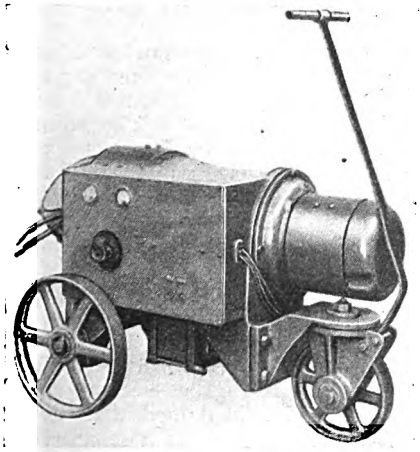
New Equipment Available

Light Portable Welder

RAPID extension of electric welding has made desirable the use of light compact portable welding outfits. To meet this demand the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has brought out a new built-in portable welder. The frame is part of the truck and the control panel is built into the framework. The equipment is lighter, smaller and more rugged than previous designs and it has a trifle better electrical performance than other portable sets.



Compact electric welder of built-in type

Metal Railroad Tie Welder

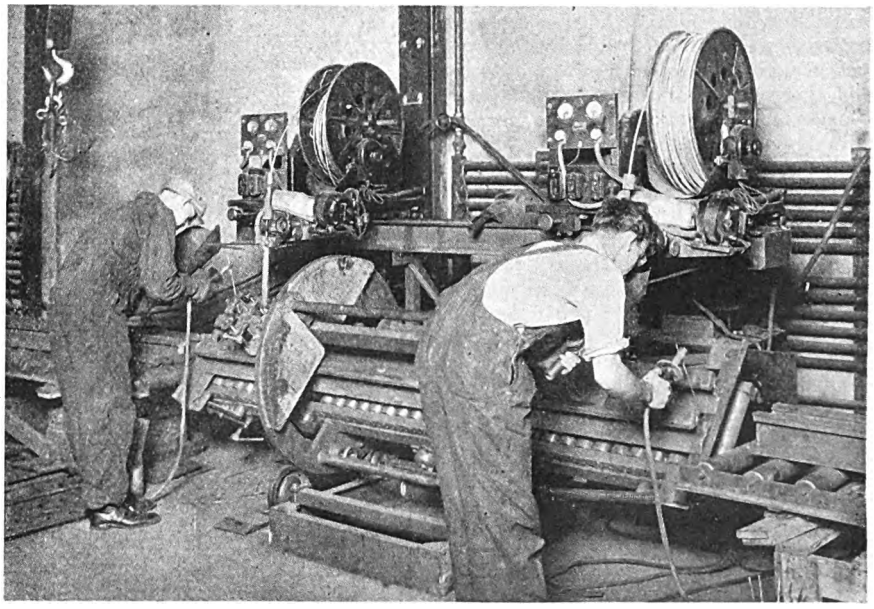
WELDING equipment for making metal railroad ties from scrap rails automatically is announced by the General Electric Company, Schenectady, N. Y. By means of this equipment railroads can make their own metal ties or manufacturers can fabricate them for sale. The new welding apparatus developed for this work consists of an automatic tie-welding machine and a 1,500-amp. motor-generator set with two circuits for hand welding and two circuits for automatic welding.

The equipment includes eight essential parts: (1) A section of a roller conveyor on which the rails are moved into position for welding; (2) a jig for spacing the rails correctly and locating the tie plates on top of the rails; (3) two pneumatic plungers for holding these parts in position rigidly; (4) a pair of spring-and-toggle-operated clamps for holding the angles against the ends of the rails; (5) a mechanism which rotates the whole jig with its rails and plates in either direction a distance of 45 deg. from the perpendicular, permitting automatic welding to be done first on one side of the tie plate and then on the other; (6) two automatic welders mounted on individual travel carriages for welding the two tie plates simultaneously; (7) a track on which the travel carriages ride; (8) a supporting framework.

The rails are inserted into the machine and the tie plates placed in position. The equipment is then held firmly by means of compressed air. The angles are next placed in position, after which the work is rotated to a point where the joints between the plates and one rail may be welded. The first welds are then made automatically, the arcs moving away from each other. The fixture is then rotated to a point where the other joints are beneath the electrode and the welds are made with electrodes moving toward each other.

While the automatic welds are being made the operator attaches the angles to the ends of the rails by hand welding. All welding being completed, the fixture is turned back to normal position and the completed tie removed.

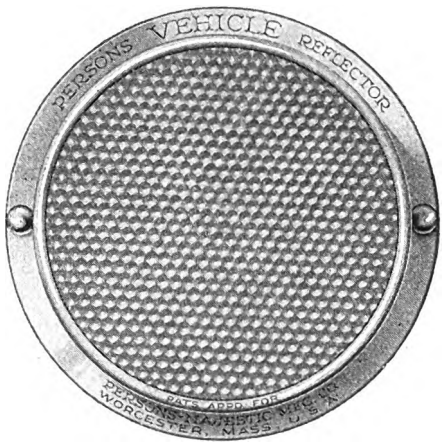
For maximum production the machine requires two operators, one for each of the two automatic heads. Each head has a separate control panel, thus making each operator largely independent of the other. Estimated output of the machine with two operators is one tie every five minutes.



Automatic arc-welding machine for fabricating metal railway ties

Reflectors for Rear Ends of Buses and Trucks

WITH the purpose of reducing rear end collisions at night, the Persons Majestic Manufacturing Company, Worcester, Mass., is marketing a reflector for the rear ends of buses, trucks and other automotive vehicles. The reflectors are made with a red, green, crystal or purple lens and are said to have good visibility on a dark road from ordinary headlights at ranges up to 500 ft. Light is reflected from the double prismatic lens which has an angularity of more than 20 deg. It receives light from the car following and returns it to its source, even though the bus or truck is going around a curve. The reflector has a face of 5 in. diameter.



Reflector for installation on buses

Association Activities

Service Improvement Occupies Attention of Midwest Association

Additional details of discussion at Hot Springs Convention indicates that railway men in Mid-Western territory are keeping their eyes to the front in the effort to win increased patronage

RAILWAY executives in attendance at the recent meeting of the Midwest Electric Railway Association held on Jan. 16 and 17 at Hot Springs, Ark., a preliminary telegraph report of which was published in last week's issue of the JOURNAL, devoted their attention more to the matter of pushing further forward on the ground already gained in the improvement of electric railway conditions, than to consideration of past difficulties. They talked on "coming out" of receiverships, of the improvement of equipment, track reconstruction programs and the speeding up of railway service. It was most encouraging to observe that their optimistic attitude was amply backed by a serious determination to keep the ball rolling in the right direction; that railway men are more alive than ever to a realization that the newest types of street car design are subject to still further advance; that in fact the work of modernizing mass transportation facilities has only made a promising beginning.

One of the headliners on the program of the convention was C. M. Ballou, City Railway Commissioner of Cleveland, Ohio. In a paper to be abstracted in some detail in a succeeding issue of the JOURNAL he made the point that progress in the railway industry, as in every line of endeavor, comes by one of two processes: one, a gradual change and adjustment to meet new conditions; the other one, revolutionary in character —necessary only in case the former fails or is too long delayed. Reviewing as a specific performance the part played by the City of Cleveland in supplying transportation under the so-called Taylor Grant for a long period of years Mr. Ballou discussed in some detail the development and functioning of the "service-at-cost" principle first established in Cleveland.

As outlined there are but very few fundamental principles in the settlement —in fact only one central idea—"service-at-cost." As foreseen by former Judge Taylor of Cleveland, chief arbitrator in the dispute between the City of Cleveland and the street railway company and the one responsible in a measure for the adoption of the original "service-at-cost" franchise, the determination of a fair valuation remains to this day the chief battleground.

Mr. Ballou laid emphasis on the point that Cleveland has in its franchise a distinct departure from the ordinary type. While it grants the railway company the usual right to occupy city streets and the privilege of operating a street railway system therein, it contains new features which involve a degree of civic responsibility not usually found in street railway franchises. Under a "service-at-cost" franchise there should be, theoretically, no dispute about the amount of service, for if more service is desired, or higher standards of service, it will cost more money and the rate of fare will be raised automatically to take care of the matter.

The natural tendency of the city is to demand an ever higher standard of service—the only check being higher fares. The major part of the discussion in the paper was directed toward indicating an answer to the question as to whether the tendency of the future is going to be toward a greater participation in transportation problems on the part of the city under the type of franchise in effect in Cleveland or result in a greater independence on the part of the street railway company. In the opinion of Mr. Ballou this question will be answered in no small measure by the additions to service which will have to be made at some future date in many communities to take care of the steadily expanding circle of suburban home developments.

In presenting a résumé of the legislative situation at Washington, Leslie Vickers, Economist of the A.E.R.A., touched upon several matters of immediate concern to the electric railway industry. He explained that nothing was to be feared from a senatorial investigation of the utility industry except as such an investigation is allowed to degenerate into an effort to capitalize purely political aspects of the situation. A fair-minded, dispassionately scientific investigation of the industry's business can be viewed with equanimity according to Mr. Vickers. Continuing in his discussion of national legislative matters, he said that the Revenue Act which has already been passed in the House must needs be amended somewhat to include workable provisions for the rendering of returns on jointly-controlled utility properties. He stated that the course of the bill regulating the operation of buses should be followed closely; that the bill as at present drawn commands the approval of all the parties concerned, including the Association of Railway & Utility Commissioners, the street railway companies, railroads, and both independent and railway associated bus companies. The opinion was expressed that the whole transportation act of 1920 needed revision to bring its provisions up to date. In concluding, Mr. Vickers outlined some of the things the national association is trying to accomplish for the electric railway industry at large and explained the functions of the New York and Washington offices of the organization as they concern contact with legislation and other matters of national scope. He pointed out the urgency for local units of the railway industry keeping their states' senators and representatives in Washington properly informed on the problems confronting them on their local properties. Only by this co-operative effort Mr. Vickers showed, could the headquarters' staff of the A.E.R.A. hope to accomplish worthwhile results in its own contacts in Washington.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Jan. 31*—New York Electric Railway Association, midwinter meeting, Hotel Commodore, New York, N. Y.**

***Feb. 13-17*—American Institute of Electrical Engineers, winter convention, Engineering Societies Building, 33 West 39th Street, New York, N. Y.**

***Feb. 17-18*—Central Electric Railway Accountants' Association, Hotel Gibson, Cincinnati, Ohio.**

***March 23*—Maryland Utilities Association, annual meeting, Emerson Hotel, Baltimore, Md.**

***May 2-5*—Southwestern Public Service Association, Dallas, Texas.**

***May 6-12*—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, biennial meeting, Rome, Italy.**

***June 6-8*—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.**

***July 8-12*—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.**

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

Citing as results, attributed in part at least to the plan of building sales instinct in street railway men, the securing of fare increases on Texas railway properties of Stone & Webster without incurring unfavorable public reactions and likewise the cutting almost in half of accident costs, R. C. Forman of Stone & Webster outlined the training methods employed in making railway employees articulate through helping them to acquire the ability to talk intelligently about the company's affairs. He particularly emphasized the fact that the work in public speaking on Stone & Webster properties is not forced on the trainmen. The course of instruction in public speaking has been offered to manager and motorman alike in an effort to get every railway employee wholesomely informed on the affairs of the company for which he works; to make every trainman an intelligent, judicious company representative. Mr. Forman outlined the methods employed in conducting the public speaking instruction and stressed the existence of a real hunger on the part of every man for the ability to talk intelligently before a group of his fellows. In the conduct of the public speaking classes groups of about twenty men are handled at one time. Subject matter is subordinated to the development of the individual. Executives of the company who themselves have taken the course at an earlier date are called into meetings of the classes and address the men on subjects pertaining to their own departments. The department head then leaves the room and the subject of his informal talk is made the occasion for general discussions on the part of those taking the public speaking instruction. So far it has been observed that the men taking the course gain in self-confidence, evolve a keener loyalty to the company born of an understanding of its problems, and finally develop in a gratifying degree into able advocates of their company's policies. Mr. Forman stressed the fact that success of any such program of employee training is dependent upon a sympathetic and fair attitude on the part of the management.

Contrasting industrial conditions prevailing in the United States with those abroad M. B. Wootan, editor of *Public Service* magazine, Chicago, attacked government ownership of industries as essentially un-American, inefficient and uneconomic. He pointed out that the industrial supremacy of this country has depended not so much on our own vast resources of power as upon the retention and unhampered recognition of man's right in man's ideas. He warned that to shackle individual initiative as professional propagandists would seem to be preaching, would be destructive to American principles and progress.

Lantern slides illustrating recently built electric railway cars, and an outline of their principle specifications were presented by C. L. Van Auken, managing editor of *Electric Traction.*

The place of the bus in urban transportation was the subject of an able paper presented by D. E. Druen of Kansas City Public Service Company. Mr. Druen's paper will appear in abstract in a later issue. It was unfortunate as Mr. Druen views it, that the bus made its debut to the street railway industry at a time when that industry was in an unreceptive frame of mind, because the "getting off on the wrong foot" has been a costly experience to both the railway industry and the bus manufacturer.

With T. J. Kelly of Fort Smith, Ark., as leader; S. E. Dillon, Hot Springs; R. B. Campbell, Wichita, Kan.; R. A. Leussler, Omaha, Neb.; F. G. Buffe, Kansas City; B. Hilburn, Tulsa, Okla.; C. J. Griffith, Little Rock, Ark.; J. L. Adams, Denver, Colo.; D. L. Fennell, Kansas City, and others enlivened the luncheon devoted to a discussion of "Transportation Failures" with experiences obtained from operation of their respective properties.

In progress at the same time was a luncheon devoted to a consideration of "Mechanical Problems," W. J. Martin of Miami, Okla., presiding. Car delays from car failures and what several companies have done to reduce interruptions to service in handling them provoked considerable discussion. Mr. Crouse of the Westinghouse Electric & Manufacturing Company presented a short paper detailing some of the mechanical features of modern railway equipment.

The Bus in Urban Transportation*

By D. E. Druen
Superintendent of Bus Maintenance, Kansas City Public Service Company, Kansas City, Mo.

With the advent of the private automobile the riding public developed an entirely new conception of transportation. When a person moves about today this movement must be in accord with or partaking of the spirit, customs or activities of this age. Any agency of city transportation incapable of supplying these qualities, even though it offers safety, comfort and economy, can only hope for mediocre success in the field of city transportation.

The every day hazards to life and limb in city life have made the average citizen indifferent to giving any forethought to his safety. He seems to rely on his ability as a quick thinker and dodger to meet the emergency when it appears. While safety in transportation is an absolute essential as a sales argument, the value of its appeal is questionable.

Comfort in city transportation is being given considerable thought and attention today. I believe that comfort should be measured in terms of its distance from hardship rather than in its approach to luxury. The vast majority of passengers will be more concerned over the length of the time they must sit in a seat than with its luxury.

The well-known ability and willingness of the American public to pay for what it wants has just about shelved that old argument based on the big difference in cost between private and public transportation.

When considering buses it must be remembered that they are a product of this age and are rapidly becoming an intimate part of city life. The bus is a full blood relative of the private automobile and, as such, what is more reasonable than to expect it capable of exciting in its passengers reactions similar to those produced by the private automobile. The passenger will invariably leave the bus under the impression that he has traveled at a much higher speed than had he been on a street car, even though the time is identical. There exists a certain feeling of good-fellowship or intimacy between the bus driver and his passengers. He appreciates the driver's skill in handling through heavy traffic a piece of equipment many times larger than the private automobile. He gets a thrill out of seeing this driver beat the red light at the intersection. He has a feeling that his driver is making every effort to get him to his destination as quickly as possible. The bus passenger is also appreciative of the fact that the bus picks him up at the sidewalk and returns him there. It relieves him of the necessity of making a mad dash through traffic to reach a safety zone, and in winter he is not obliged to wade across gutters and streets filled with slush.

**Abstract of a paper presented at a meeting of the Midwest Electric Railway Association, Hot Springs, Ark., Jan. 16-17, 1928.*

Fares Must Be Adequate

If the bus can furnish these two prime requisites of today's city transportation—reasonable comfort and high speed—the question naturally arises as to the value of what the rider should pay for this kind of service. The average fare now charged on bus operation throughout the country is not only inadequate but is not consistent with the value received, and bus operators will, undoubtedly, encounter some difficulty in establishing a proper and adequate bus fare until such a time as the existing street car fare is raised to a point where it properly belongs.

One thing should not be lost sight of and that is the necessity of avoiding the establishment of a fixed fare precedent. A fixed fare is not in keeping with the flexibility of bus operation and will surely work a hardship on both the public and the operator.

Any collective effort in the matter of fares on the part of urban bus operators should at all times preserve to the individual property the right to adjust its fares to its particular conditions, and to all properties the right of a variable fare consistent with the nature of or class of service furnished.

Digitized by Google

In the matter of bus routes, an intelligent selection can be made only after a most exhaustive study. Where buses are routed through territory served by street cars bus routing should be such as to avoid as much as possible any close duplication of service. In substitution it is not necessary that the bus traverse the same route formerly traversed by the street cars. It should be permitted to take advantage of those features of topography and roadway that contribute to its best operation. Where community organizations and real estate developers demand bus routes in districts the available patronage of which will not support a route, it seems fair to make use of the trial method to obtain proof of the value of such a route. Under the trial method service is established for a certain test period and if at the end of that time the patronage has not been sufficient to support it, it is abandoned.

Other important features to be considered in selecting a route are conditions of pavement, facilities at the end of the route for turning or looping, and the traffic preference of the streets.

In the matter of pavement, statutes and ordinances providing for the assessment of costs of repairing and renewing pavement are in a more or less chaotic condition. The bus operator should be prepared to protect his interests if he would avoid that paving affliction with which the street railway industry has been burdened for so many years. The use of arterial highways by buses, when possible, offers a considerable advantage in that higher speeds may be maintained and there is also a considerable reduction in the collision hazard. There is another advantage by making use of streets or boulevards where snow removal is performed by city forces.

Standardized Bus Maintenance

Just a few words on bus maintenance. A type of bus maintenance organization that seems to be meeting with considerable success patterns somewhat after the general practice followed by steam roads in the maintenance of locomotives. The work conveniently divides itself into three general classes: inspection; running repairs; and back shop. Inspection crews are generally made up of one mechanic and a helper. These two men will work a bus from front bumper to tail light in one nine-hour day. They do very little repair work of any kind and no major repairs. Their chief duties are the checking of bearings, transmissions, differentials, brake riggings, engine adjustments, steering, etc. They are not called on to do any work about the garage other than this inspection. Buses are brought in for inspection on a predetermined mileage basis, varying on different properties from 2,500 to 4,000 miles.

The running repair crew make light inspections and repairs, being governed in their work largely by the operators' report cards turned in on the buses. The work of this crew is largely confined to night work in order to take advantage of having a majority of the equipment in the garage at one time.

The back shop does practically all of the repair work, such as overhauling engines, transmissions, rear ends, brake lining, drive lines, battery work, etc. These men do not work out on the floor. When inspection men find a defective part or a unit due for overhaul, they remove it from the bus, take it to the back shop and in exchange receive either a new or an overhauled unit as a replacement.

It is surprising to note the small amount of equipment required in a completely equipped back shop as compared to that found in a street car maintenance shop. This, in a measure, is because the widespread use in buses of high grade alloyed steels deprives the bus maintenance foreman of that general practice of the street car man of manufacturing so many of his own parts.

Trend of Bus Design

All of us in bus operation naturally are giving considerable thought as to what will constitute the ideal bus for city transportation. Unlike the street car, each succeeding year will see the development of a bus cheaper in first cost, maintenance and operating expense, improved in speed, riding qualities, and ease of handling. Present day bus construction is taking a trend toward these last named three qualities with an ever increasing simplicity in mechanical construction.

Do not let creep into the bus business that costly fallacy that has existed in the street car business which seems to demand a different type of street car for every city. Let the bus builder build your buses. Work with him but do not cramp his style by imposing on him restrictions born of a period in the past. Public demand will safely and surely pilot the evolution of the bus if you but give it the opportunity.

If you want to make a real contribution to the bus progress set up and follow an accounting system that will provide for the retirement and replacement of equipment on a short life basis as compared to the present life of a street car. This will have a tendency to lower first costs, stimulate improvement in design, and will at all times enable you to challenge the public with equipment suited to the demands of today.

Standard Steel Signs and Signals Recommended

AS A RESULT of a year's study by the American Engineering Council of the problem of a national system of standard street signs, signals and markings, the committee which had been engaged in this problem submitted recommendations based upon its findings. This work was carried on as the result of Council's participation in the National Conference on Street and Highway Safety. The fundamental data for the study were obtained from more than 100 of the principal cities of the country embracing a population of approximately 35,000,000.

The local work called into this public service nearly 400 engineers, safety men, and city officials, who were directly responsible for securing the data from the cities. The recommendations submitted proposed to establish a set of signs that will be recognized as standard throughout the country. Similarly, control of traffic through the automatic signal system was reported on, special reference being made to the type of signal, its location and the control best suited to the various city requirements.

Recommendations for markings, street car loading platforms and safety zones were also contained in the report.

Kentucky Association Elects

ABOUT 400 members of the Kentucky Association of Public Utilities attended the eleventh annual convention and banquet held at Louisville Jan. 18 and 19. The principal speakers at the dinner were the Hon. Edwin P. Morrow, Railway Wage Board, Washington, D. C., former Governor of Kentucky; and Lucius S. Storrs, managing director American Electric Railway Association. Ex-Governor Morrow in a humorous way touched on water power development in Kentucky, and expressed the hope that such resources would be developed to the greatest possible extent without robbing the state of scenic beauty. Public transportation was described by Mr. Storrs as the most important of all departments in the field of public utilities. Meddling of demagogues in the question of railway fares, he said, has often forced companies to operate at a loss and made it impossible to improve the service.

Officers elected for the coming year are:

President, Samuel Riddle, vice-president Louisville Railway.

First vice-president, W. H. Harton, gen. mgr. Cincinnati, Newport & Covington Railway.

Second vice-president, L. B. Herrington, president Kentucky Utilities Company.

Treasurer, A. A. Tuttle, vice-president, and treasurer, Kentucky Utilities Company.

Secretary, E. F. Kelley, secretary to the president Louisville Railway.

Mr. Riddle was advanced from first vice-president to president, and Mr. Harton was elected to the first vice-presidency, the other officers being re-elected.

The new board of directors comprises the officers and the following:

T. B. Wilson, vice-president and general manager Louisville Gas & Electric Company; J. P. Barnes, president Louisville Railway; W. S. Cramer, vice-president and general manager Lexington Water Company; W. R. Power, general manager Kentucky & West Virginia Power Company; P. S. Pogue, Louisville Heating Company; J. P. Pope, vice-president and general manager Kentucky Traction & Terminal Company; H. J. Cochrane, president Maysville Water Company; N. C. Funk, Kentucky Power Co.

American Association News

Association Committees Appointed

COMMITTEE lists of the American Association have now been completed. These include the chairmen and vice-chairmen of the convention committees for the next annual meeting and exhibit of the association to be held in Cleveland next September, although the full membership of these convention committees has not yet been announced. The list follows:

Advisory Council

B. C. Cobb, vice-president Hodenpyl, Hardy & Company, New York., N. Y., chairman.
H. A. Blair, Chicago, Ill.
H. G. Bradlee, Boston, Mass.
N. F. Brady, New York, N. Y.
M. C. Brush, New York, N. Y.
B. I. Budd, Chicago, Ill.
G. H. Clifford, Boston, Mass.
F. R. Coates, New York, N. Y.
S. M. Curwen, Philadelphia, Pa.
H. L. Doherty, New York, N. Y.
C. D. Emmons, Baltimore, Md.
P. H. Gadsden, Philadelphia, Pa.
C. E. Groesbeck, New York, N. Y.
Edwin Gruhl, New York, N. Y.
Samuel Insull, Chicago, Ill.
T. N. McCarter, Newark, N. J.
S. Z. Mitchell, New York, N. Y.
J. J. O'Brien, Chicago, Ill.
J. H. Pardee, New York, N. Y.
H. Hobart Porter, New York, N. Y.
A. W. Robertson, Pittsburgh, Pa.
J. N. Shannahan, Omaha, Neb.
Paul Shoup, San Francisco, Cal.
R. P. Stevens, New York, N. Y.
Lucius S. Storrs, New York, N. Y.
A. W. Thompson, Philadelphia, Pa.
O. D. Young, New York, N. Y.

Policy

J. P. Barnes, president Louisville Railway, Louisville, Ky., chairman.
Paul Shoup, San Francisco, Cal., vice-chairman.
J. G. Barry, Schenectady, N. Y.
M. B. Lambert, New York, N. Y.
Harry Reid, New York, N. Y.
G. A. Richardson, Chicago, Ill.
J. N. Shannahan, Omaha, Neb.

Finance

T. A. Kenney, Hodenpyl, Hardy & Co., New York, N. Y., chairman.
C. R. Ellicott, New York, N. Y., vice-chairman.
F. W. Doolittle, New York, N. Y.
C. E. Morgan, Brooklyn, N. Y.
E. P. Waller, Schenectady, N. Y.

Subjects and Meetings

F. R. Coates, president the Community Traction Company, c/o H. L. Doherty & Co., New York, N. Y., chairman.
J. P. Barnes, Louisville, Ky.
J. R. Blackhall, Highwood, Ill.
H. V. Bozell, New York, N. Y.
C. A. Brooks, New York, N. Y.
L. C. Bradley, Providence R. I.
R. F. Carbutt, New York, N. Y.
H. C. Clark, Newark, N. J.
G. H. Clifford, Boston, Mass.
L. J. DeLamarter, Grand Rapids, Mich.
Walter A. Draper, Cincinnati, Ohio.
F. W. Doolittle, New York, N. Y.
Charles Gordon, New York, N. Y.
M. B. Lambert, New York, N. Y.
M. McCants, San Francisco, Cal.
C. E. Morgan, Brooklyn, N. Y.
L. H. Palmer, New York, N. Y.
W. T. Rossell, Pittsburgh, Pa.
Edward A. West, Salt Lake City, Utah.

Publicity

Paul Shoup, president Pacific Electric Railway, San Francisco, Cal., chairman.
Barron Collier, New York, N. Y., vice-chairman.
F. L. Blanchard, New York, N. Y.
F. G. Buffe, Kansas City, Mo.
W. H. Burke, Houston, Tex.
F. D. Burpee, Ottawa, Canada.
Joe Carmichael, Des Moines, Iowa.
H. C. Clark, Newark, N. J.
H. O. Crews, Chicago, Ill.
Robert Dougan, Washington, D. C.
P. H. Gadsden, Philadelphia, Pa.
L. E. Gould, Chicago, Ill.
W. V. Hill, San Francisco, Cal.
W. H. Hodge, Chicago, Ill.
J. P. Ingle, Jacksonville, Tex.
R. J. Lockwood, St. Louis, Mo.
Hal M. Lytle, Chicago, Ill.
J. C. McQuiston, E. Pittsburgh, Pa.
Martin P. Rice, Schenectady, N. Y.
J. S. S. Richardson, New York, N. Y.
D. W. Snyder, Jr., Springfield, Ill.
L. K. Starr, Atlanta, Ga.
W. P. Strandborg, Portland, Ore.
A. C. Watt, New York, N. Y.
E. F. Wickwire, Mansfield, Ohio.

National Relations

J. H. Hanna, president Capital Traction Co., Washington, D. C., chairman.
Frank Karr, Los Angeles, Cal., vice-chairman.
R. R. Bradley, Chicago, Ill.
A. W. Brady, Anderson, Ind.
C. D. Cass, Waterloo, Iowa.
G. H. Clifford, Boston, Mass.
G. H. Harries, Chicago, Ill.
Frank Silliman, Jr., New York, N. Y.
D. W. Snyder, Jr., Springfield, Ill.
E. W. Wakelee, Newark, N. J.
B. F. Weadock, New York, N. Y.
F. H. Wilson, Cleveland, Ohio.

Depreciation

(Sub Committee of National Relations)
Thomas Conway, Jr., president Cincinnati, Hamilton & Dayton Railway, Philadelphia, Pa., chairman.
L. R. Nash, Boston, Mass., vice-chairman.
F. W. Doolittle, New York, N. Y.
M. W. Glover, Pittsburgh, Pa.
C. R. Harte, New Haven, Conn.
A. S. Richey, Worcester, Mass.
Richard Sachse, Los Angeles, Cal.
C. E. Thompson, Chicago, Ill.
J. H. Hanna, Washington, D. C., ex officio.

Publications

J. H. Hanna, president Capital Traction Co., Washington, D. C., chairman.

Rolling Stock Special Committee No. 3

DISCUSSION of the conditions under which the tests of various drives would be conducted at the Bureau of Standards in Washington took up the time of the sub-committee on tests at a meeting held at Chicago, Ill., on Jan. 12. Those present were H. H. Adams, chairman; C. A. Burleson, W. J. Clardy, A. L. Kasemeier and G. L. Kippenberger.

Due to construction requirements of some of the drives it was found impossible to separate the losses sustained in the gearing from those sustained in the accompanying substitutes for the journal bearings used in ordinary street car equipment. It would require that in these tests the efficiency would have to be determined as over-all efficiency from motor connection to wheel rim. On this account it was decided that if possible all units should be tested under these same conditions and the efficiency determined on that basis.

Lubrication of the units during test was discussed, and it was decided that in order to secure efficiency figures on the various types of units as operating under service conditions as nearly as possible, that it would be advisable to use the lubrication appropriate to the specific type of unit as actually in service.

As some of the units are equipped with anti-friction bearings in place of the plain standard journal bearings, it was felt that this test should also determine if possible the effect of this type of bearing on the efficiency of these units. It was felt that one type of unit equipped with anti-friction journal bearings would be sufficient, as the proportionate gain in efficiency secured by the use of this bearing could be taken into consideration when discussing the efficiency of any other type of unit if it should be equipped with anti-friction journal bearings.

On this basis it was then determined that the following types of drives would be required for tests at Washington:

1. One truck equipped with two W-N double reduction drive units, one unit to be equipped with plain journal bearings and the other to be equipped with anti-friction journal bearings.
2. One truck equipped with two units consisting of one Cincinnati Car Company type of worm-drive unit and one single reduction spur gear drive of the Tool Steel Gear & Pinion Company.
3. One truck of two units each equipped with one St. Louis Car Company type of worm-drive unit and one axle prepared for use with the standard single reduction motor drive as it is now being used.
4. One unit of the Timken-Detroit Axle Company's type of worm drive.
5. One unit of the Eaton Spring & Axle Company type of double reduction drive.

The General Electric Company agreed to furnish if necessary a GE-265 motor for use with the single reduction spur gearing unit of truck C, and also a GE-1126 600-volt 35-hp. automotive type motor for use at the Bureau of Standards. The Westinghouse Electric & Manufacturing Company agreed to furnish if necessary a No. 1425 600-volt 35-hp. automotive type motor, or a V-91 300-volt 28-hp. type of motor for use at the Bureau of Standards. They also agreed to furnish a series of drawings showing set-ups under which these units might be tested and have them ready if possible for the next committee meeting.

W. & S. Special Committee No. 7

SPECIAL committee No. 7 of the way and structures division of the Engineering Association, appointed to study the possibilities of the use of alloy steels other than manganese in special trackwork, held a meeting in Philadelphia on Jan. 11.

The meeting was attended by the following members: A. T. Spencer, chairman; W. G. Hulbert representing J. H. Hall, F. G. Hibbard, P. A. Kerwin, R. H. Noderer, O. C. Rehfuss and N. E. Salsich. J. F. Rodgers and Mr. Raiguel of the P.R.T. were also present.

Last year's work was reviewed and arrangements made to follow the experience gained from existing installations and report. Offers were accepted from committee members to make road experiments with welds made on artificially broken corners on new chrome-nickel and manganese steel pieces. Tentative arrangements were also made be gin laboratory experiments to determine, if possible, the comparative weldability of these two metals.

Following the business meeting, the committee, under the guidance of John F. Rodgers, of the Philadelphia Rapid Transit Company, inspected a number of special trackwork layouts of chrome-nickel steel.

Association Reports in Preparation

SPECIAL reports being prepared by the Bureau of Information and Service of the American Electric Railway Association are listed below. They will be available to member companies on request:

Bulletin No. 178.—Motor Bus Legislation in 1927—Contains complete copies of all motor bus regulatory legislation passed during the year 1927 with a carefully prepared analytical index permitting ready reference to any section of the new laws. This bulletin supplements Bulletin No. 120, State Regulation of Motor Bus Common Carriers, issued Jan. 1, 1927, and covers all legislation enacted since the date of that bulletin.

Bulletin No. 179.—Electric Railway Financing—Gives a list of the new securities issued by electric railways in 1927, showing the type of security, the amount issued, the interest rate and the offering price. The bulletin also contains a summary of securities defaulted, retired or refunded during the year, the amounts of securities outstanding of companies abandoning service during the year and a summary of the net effect of these new issues and retirements on the capitalization of the industry.

Bulletin No. 180.—Daily, Weekly and Monthly Pass and Identification Card—Contains a list of companies using the various forms of the pass or identification card idea with the reasons for adopting it and a summary of the results obtained and the opinions of operators as to their advantages and disadvantages. It also gives a list of companies which have experimented with and discontinued the use of the pass or the identification card, together with a summary of their results and the reasons for the discontinuance.

Bulletin No. 181.—Trend of Material Prices—A new edition of the Association's regular bulletin on relative costs of materials, bringing down to date the trend of prices of materials used by electric railways based on data contributed by the manufacturers of such material.

In addition to the above the following supplements have been prepared, bringing the information they cover down to date:

Supplement No. 3 to Bulletins Nos. 163 and 164, Electric Railway Fares.
Supplement No. 4 to Bulletin No. 160, Wages of Trainmen.
Supplement No. 4 to Bulletin No. 161, Wages of Bus Men.
Cost of Living Studies (Bulletin No. 182).

News of the Industry

Hearings on Public Control

Committee of Massachusetts Legislature takes up question of future of Boston "L"

PUBLIC hearings were begun this week before two committees of the Massachusetts Legislature on the various bills pertaining to the future treatment of the Boston Elevated Railway. It was brought out at the opening hearing that the trustees of the Boston Elevated favor the proposition from the Metropolitan Planning Division to extend the public control fifteen years, and also favor the proposed extensions of the subway lines at a cost of $35,000,000 to $40,000,000.

H. Ware Barnum spoke for the Board of Trustees, as its counsel. He said that the trustees did not directly indorse at this time the proposed extension to Malden Square, because it has not given the matter sufficient study. The trustees differed from the Planning Division in one important detail on the division of cost. The trustees feel that the car riders should be required to pay only one-third, while the Planning Division proposed that they should pay one-half. The amounts that do not come out of fares should be raised by betterment assessments or certain forms of taxation.

Assessment for Betterments Held to Be Legal

The Supreme Court has ruled that assessment of betterment in the district traversed by the rapid transit line is legal, and Mr. Barnum showed how real estate values have gone up by citing one example on the Dorchester extension. There the Elevated before the extension bought a key piece of land for 25 cents a foot which now has a value of $1.50 a foot. It is only fair that land thus benefitted should pay a part of the cost of the rapid transit lines.

While sentiment is strong for continued public control of the Elevated, still it became clear also that there is an element in the Legislature which will fight for immediate public ownership of the road. The hearings will continue, according to Senate Chairman Warren, so long as the public desires to discuss the matter before the committee.

One of the problems coming under discussion now is what is to become of the company at the end of 40 years when the bonds to be issued in connection with service extensions will mature; whether the state has not by that time acquired a property right which establishes a form of state ownership and therefore commits the state to public ownership.

Another issue raised is whether the stockholders of the Elevated can be made to accept the proposed legislation and to carry out the $40,000,000 extension projects which are promised. The present answer to this is that there are two parties to the contract and the rights of the Elevated stockholders to accept or reject any new contract offered by the Legislature must be respected.

Final Hearing on Walsh Resolution Set for Jan. 30

Conclusion of hearings on the Walsh public utilities resolution was definitely set for Jan. 26, and consideration in committee scheduled for Jan. 30, by the Chairman, Senator Watson, of Indiana, following the Jan. 25 session of the Senate Committee on Interstate Commerce.

The only witness heard on Jan. 25 was the chairman, James Emery, of the National Association of Manufacturers. Mr. Emery concluded his statement of the preceding day, and was questioned by members of the committee. The only remaining witness is the chairman, W. B. Ainey, of the Pennsylvania Public Service Commission.

Former Senator Irvine L. Lenroot, counsel for the Joint Committee of National Utility Associations, announced that he might call upon W. L. Ransom, New York attorney, who helped prepare the joint committee's brief, to make a final statement. Senator Walsh of Montana, author of the resolution proposing an inquiry by a special Senate committee into the gas and electric industries, stated that he would require no more than a half hour to conclude his presentation.

Senator Watson stated orally, following the hearing, that the procedure he has outlined had been fixed upon in order to give members of the committee and the Senate time to read the record of the hearings. He said he could not say whether a committee report could be expected after the Jan. 30 session. He said:

> This is a highly important matter, and we cannot act too hastily. We will give all interested parties until next Monday to read the record, and then take up the resolution in executive session. We hope to finish shortly, but cannot tell.

Endless Chain Plan Reappears in Des Moines

Officials of the Des Moines City Railway, Des Moines, Ia., have found it necessary to warn the public against a company which was reported to be selling the regular weekly pass on the endless chain plan. Otto H. Bernd, secretary of the railway, stated that the plan was similar to the one used in many localities to dispose of merchandise. The first purchaser paid in 25 cents and received a card with slots for six more 25-cent pieces. When six friends had paid 25 cents each the original customer got a pass worth $1.25. Then they in turn started out to repeat on their friends. Mr. Bernd estimated that by the time the fifth cycle was reached, it would require nearly 50,000 persons, whereas, the largest sale of passes ever recorded here was 13,000.

Hearings on Oakland's Fare

Ten-cent fare petition in Californian city put over until March. Company opposed to commission's zone order

AFTER a two-day hearing, State Railroad Commissioner Clyde Seavey adjourned the zone rate case of the Key System Transit Company, Oakland, Calif., until March 6. Pressing their demand for a 10-cent fare and $1 weekly passes, officials of the company on the first day of the hearing, Jan. 24, in Oakland City Hall, declared that the commission's 5-cent zone fare order would result in a loss of $1,078,666 annually.

Richard Sachse, noted consulting engineer, chief witness for the company, stated that of this loss $1,003,811 would be in the traction division and $73,855 in the ferry division. Citing Seattle, it was shown that during 1923, when the rate in that city was reduced from 10 cents to 5 cents for 107 days, there was a resultant loss of $1,790,000 based on an annual computation. Mr. Sachse also said that when fares in Chicago were reduced from 8 cents to 7 cents it required five years for the street railroads to recover from the loss.

Vice-President C. C. Vargas, of the Key System, testified that the company was operating at a loss under the present 7-cent fare, and H. P. Bell, chief engineer, claimed that the system's income was insufficient to meet maintenance and new equipment needs.

A battle over a bulletin published by the American Electric Railway Association developed on the second day of the hearing. The bulletin had to do with the resultant traffic on street-car lines in ten cities following rate reductions. H. E. Mott, chief engineer of the California Railroad Commission and author of the 5-cent zone plan for the East Bay, urged Herman Phleger, chief counsel for the Key, to introduce the bulletin as evidence. Mr. Phleger refused, citing the danger of misinterpretation, and Mr. Mott said he could not introduce it because it had been given him in confidence. Assistant Attorney John Collier, of Oakland, asked Commissioner Seavey to order

Digitized by Google

the bulletin produced. Mr. Phleger objected but agreed to the admission of the document by the consent of the association or by any of the cities involved.

Cross-examined by Assistant Attorney Collier, Mr. Sachse admitted that the combined traffic of the Market Street and municipal railways in San Francisco, which operate under a 5-cent fare, showed an increase in 1927 passenger traffic. The Market Street lines show a falling off of 0.7 per cent, whereas the municipal lines gained 1.507 per cent.

Officials of all East Bay cities were represented at the hearing to oppose the Key System's 10-cent fare demand.

$13,000,000 Subway Item for New York Approved

Mayor Walker of New York has signed the Municipal Assembly bill to enable the Board of Estimate to dispense with the certificate of the comptroller in including an item for $13,000,000 for the amortization of a proposed issue of $52,000,000 of short-term subway construction bonds in the 1928 budget.

A decision on the Citizens Union action to compel the board to eliminate the item from the budget is expected soon from the Court of Appeals. Both Supreme Court Justic Wasservogel and the Appellate Division decided in favor of the Citizens Union and the item is now out of the budget, with the understanding that it may be restored if the Court of Appeals' decision is favorable to the city administration.

The Board of Estimate on Jan. 20 postponed for one week approval of the contracts for the construction of the Nassau Street subway recommended by the Board of Transportation to get the opinion of a disinterested engineer, yet to be selected, on the merits of the "cut and cover" and tunnel methods of construction.

Express Service in Detroit to Be Extended

Just as soon as equipment is available express service on the Grand River Line of the Detroit Municipal Railway, Detroit, Mich., will be started. Since the inception of the express service on Jefferson Avenue the revenues on that line have been increased materially despite the falling off in employment in this section. Ultimately the commission expects to extend the service to all of the major lines of the system.

As one editorial writer put it the experiment was a great boon to people living on the lower east side and represented the nearest thing to actual rapid transit Detroit ever had known.

Details of the express service on Jefferson Avenue were given in an article which was contributed to the ELECTRIC RAILWAY JOURNAL, issue of Jan. 7, page 4.

Present Eight-Cent Fare in St. Louis to Continue

The present fare on the lines of the St. Louis Public Service Company in St. Louis, Mo., of 8 cents or two tokens for 15 cents will continue for at least another six months from Jan. 5, when the original order expired, since the city is not ready to proceed with the hearing of the valuation upon which to establish a permanent fare.

Last July the city, through its counselor, asked that the hearing be postponed until it could check additions and betterments to the properties claimed to have been made during the receivership. This check has not been completed.

Joseph H. Grand, city attorney for University City, has asked the Missouri Public Service Commission to abolish the extra fare charged passengers who transfer from the Delmar-Olive to the Creve-Coeur Lake line for points in University City.

Chicago Parking Ban is Boon to Car-Riders and Pedestrians

Because of the new no-parking ordinance which became effective on Jan. 10, downtown Chicago has become not only a speedier place to ride in but a safer place to walk in, according to E. J. McIlraith, traffic engineer of the Chicago Surface Lines. On this matter he is reported to have said:

> The rule has increased the safety of street car passengers and of pedestrians. For one thing, motorists in the "Loop" have more room for driving—they have more chance to maneuver on the downtown streets without endangering anyone. That factor has increased general safety. Furthermore, pedestrians who cross streets or prospective passengers about to board street cars now have better visibility and therefore greater safety than when long lines of automobiles parked at the curbs blocked their view.
>
> As to the speed and regularity of surface lines transportation there is no doubt that the parking ban has helped. It has practically eliminated street car jams in the "Loop." And it must be remembered that eliminating jams in the "Loop" means increasing the regularity of service not only downtown but throughout the city.

The new regulation has not been in force long enough, Mr. McIlraith believes, to determine accurately its effect on the volume of railway riding.

A few downtown business houses have reported an increase in patronage and some a slight falling off in business since the Loop streets were cleared of parked cars, but the consensus so far is that the law should be given a fair trial before it is repealed or permanently adopted. Acting on protests which he had received, principally from small "Loop" stores, however, Alderman J. J. Coughlin introduced a resolution in the City Council on Jan. 16 asking that interests opposed to the enforcement of the ban be given an early hearing by that body. The resolution was referred to a sub-committee on traffic regulation.

New York's Comptroller Has Plan

Tentative draft prepared of proposal he feels would solve transit problem. Commission's counsel dissents

COMPTROLLER BERRY of New York and his advisory committee on transit have prepared a report favoring the maintenance of the 5-cent fare for a trial period of three years and the submission of the fare question to the people of the city in a referendum at the end of that period if found necessary. This is the position which has been taken by Mayor Walker. The report also recommends unification of the city's transit lines and the creation of a "Transit Authority," with powers similar to those of the Port of New York Authority, to take over the unified system and lease it to an operating company.

The report also recommends limitation of the profit of the operating company and provides for ultimate ownership of the transit lines by the city when the securities issued in payment for the properties of the Brooklyn-Manhattan Transit Corporation and Interborough Rapid Transit Company, in case their purchase is consummated, shall have been retired.

Comptroller Berry's present position, as indicated by the tentative report of his advisory committee, is said to be in line with the views of Mayor Walker and Mr. Delaney with the possible exception that the Berry committee report seems to recommend the inclusion of the surface lines, to which the Mayor and his advisers are said to have been opposed. It was suggested, however, that this might be subject to adjustment either by the city buying the surface lines at a price low enough to make their operation no great burden on the city or by an agreement to exclude the surface lines. The pending negotiations with the B.-M. T. have been on the basis of purchase of the rapid transit lines only.

One of the phases of the question on which the committee and the comptroller have not reached a definite conclusion is the organization of the company to operate the proposed unified system. It is assumed that any plan proposed would call for some combination of the B.-M. T. and the Interborough, but it is possible that a new operator might be sought. Under the terms of the proposed bill this would be a matter for the decision of the Transit Authority, perhaps with the concurrence of the Board of Estimate. Section 2 in the tentative report, not yet been drafted, probably will refer to the operating company.

On the comptroller's advisory committee are Jesse I. Straus, head of R. H. Macy & Company; Gen. George A. Wingate, surrogate of Kings County, and Elisha Walker, head of Blair & Company, bankers.

Comptroller Berry's plan to include surface lines in any proposal put forward for the unification of transit facilities would kill the 5-cent fare or

Digitized by Google

load the city budget with deficits, Samuel Untermyer said on Jan. 24. Among other things he said:

The Legislature has intrusted the preparation of the plan to the Transit Commission and not to the Comptroller. Why does he not leave us in peace to work out this plan? When it reaches the Board of Estimate he has three out of sixteen votes for the adoption or rejection of the plan.

If he has any suggestions that would aid the commission, why does he not submit them there instead to the newspapers? If, when the plan is formulated, he does not like it, perhaps he will try his hand at another, provided his colleagues in the Board of Estimate do not adopt the commission's plan.

Meantime we are kept working overtime explaining away his constant digs at everything that is being done or attempted to be done.

One Cent an Hour and Insurance Granted in Chicago

The arbitration award which settled the wage question on both the Chicago Surface Lines and the Chicago Rapid Transit systems was announced on Jan. 21 by the two arbitrators, Guy A. Richardson, vice-president of the Surface Lines, and Alderman Oscar Nelson, representing the employees. While the award is made in the case of the Surface Lines, the Chicago Rapid Transit Company and employees abide by its terms.

Under the terms of the award, the employees receive in addition to the $1,000 life insurance and $20 a week sick benefit indemnity, 1 cent an hour increase in wages beginning June 1 and another cent beginning June 1 next year. The insurance, which is to be considered wages, amounts to approximately 1½ cents an hour. The agreement runs until May 31, 1930.

In lieu of insurance from June 1, last, to Feb. 1 this year, trainmen who were in service on June 1 receive $35 in cash and those who entered the service between June 1 and Nov. 1 receive $12 in cash. This is done because it is practically impossible to make insurance retroactive. The amount of cash given the trainmen is approximately the amount of money it would have cost the Chicago Surface Lines in case the insurance had been in effect since June 1. Working conditions were not involved in the arbitration and remain the same. The present wage of Chicago Surface Lines trainmen is 75 cents an hour. Following the award granting to trainmen on the Chicago Surface Lines $1,000 in life insurance and $20 a week sick benefit, the management of the Surface Lines has announced that the insurance benefits will be extended to all of the 16,500 employees of the company. This insurance will cost the company about $650,000 annually.

The Chicago Rapid Transit employees are not affected by the clauses relating to insurance as they were granted insurance the previous year by the company.

Under the provisions of the agreement for arbitration signed by union and company officials, it was understood that Messrs. Richardson and Nelson should proceed with the arbitration and reach an agreement if they could. In case they were able to agree they were empowered to make the agreement run until May 31, 1930. If they could not agree they were to select a third man and in that case the agreement could extend only to the end of the current fiscal year, ending June 1, next.

The union men asked for an increase of 15 cents an hour and the insurance features.

Rapid Transit Line to Flushing Opened

Rapid transit was extended on Jan. 21 over the Queensboro lines to Main Street, Flushing. Steinway Tunnel trains from Times Square, and Brooklyn, Manhattan Transit trains from Queens Plaza operate through to Main Street, Flushing. Second Avenue elevated trains will turn at Willetts Point Boulevard until such time as additional equipment is installed at the Flushing Terminal to accommodate them. Steinway Tunnel trains and the B.-M. T. trains will give a 3½-minute interval out of the Flushing Terminal during rush hours.

The Flushing Extension is approximately nine-tenths of a mile in length. The Queensboro Subway is one of the original lines provided by the Dual Contract, executed in 1913, but as originally planned, the Corona branch of the line ended at Alburtis Avenue, 1½ miles distant from Flushing. The Transit Commission in 1921 authorized the extension of the line from Alburtis Avenue to Main Street, Flushing. Contracts for the construction were awarded by the commission in 1922, but were not approved until 1923.

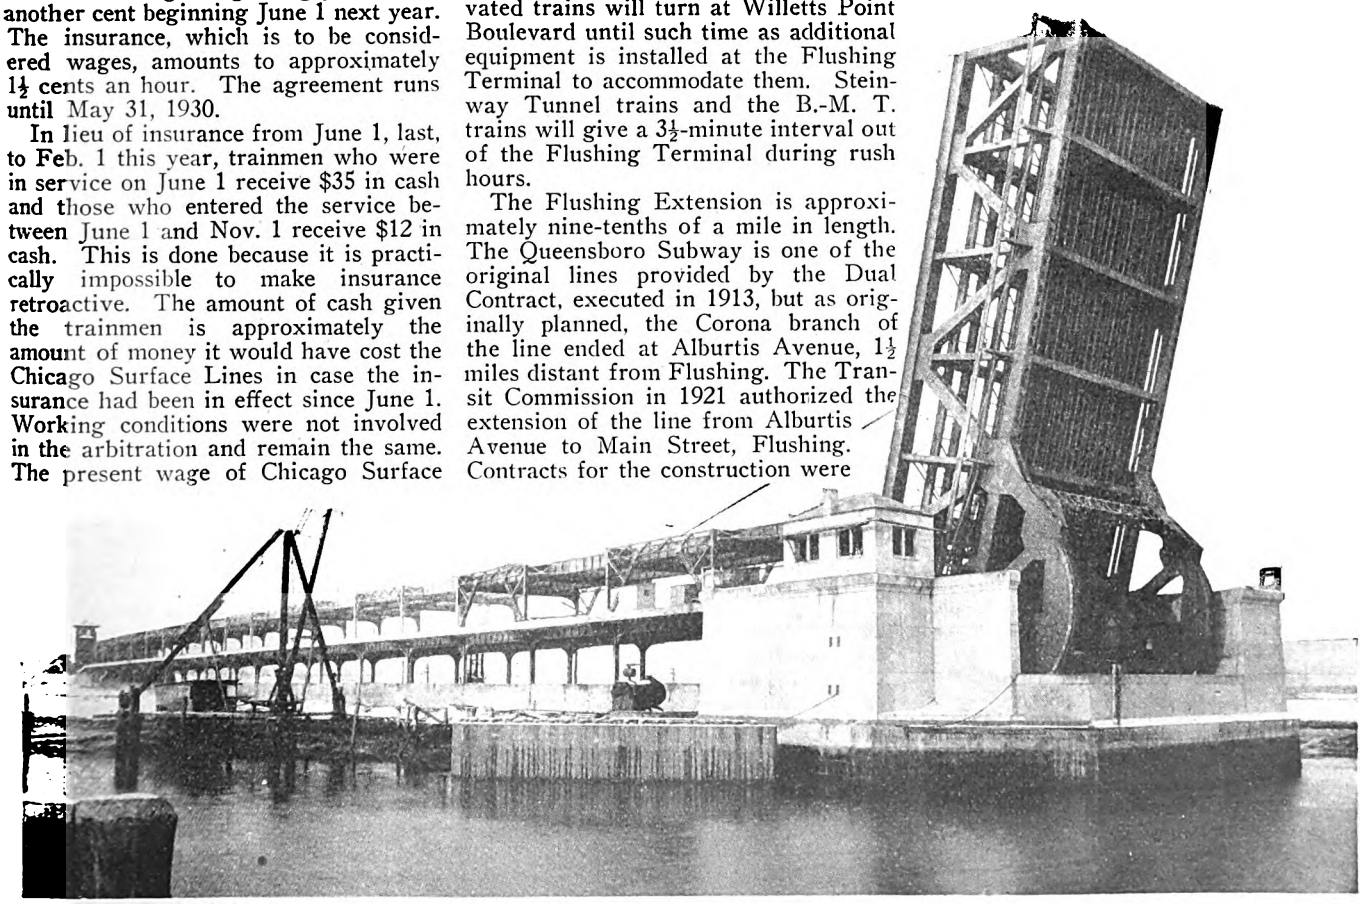
The extension is an elevated railroad running from the former terminus of the line at Alburtis Avenue, crossing Flushing Meadows and over Flushing Creek by bridge, and then by subway to Main Street, Flushing. Owing to the nature of the ground in Flushing Meadows, the completion of the line was delayed for almost a year. When the structure was first erected, it was found that the pillars supporting it, at a point near Flushing Creek, had settled perceptibly, and that it would have been dangerous to institute train operation over it. The structure, however, was found to be sound as far as Willetts Point Boulevard, and train operation to that point was started.

On the Flushing line, across Flushing River, is the Roosevelt Avenue Bridge, the largest trunnion bascule lift bridge east of Chicago and probably the largest of its exact type in the world.

An unusual feature of this bridge is that it is double-decked. The upper level will carry three rapid transit railroad tracks and the lower will provide a very much needed vehicular thoroughfare for this locality.

The clear height of the bridge is 25.6 ft., above mean high water, which is sufficient to permit the passage of ordinary tugboat traffic without opening the bridge. The Arthur McMullen Company was the general contractor and the McClintic-Marshall Company fabricated and erected the steel superstructure.

The bridge and approaches cost $2,700,000.



Roosevelt Avenue Bridge on Flushing Rapid Transit Line

Paving Schedule in Detroit Amounts to $4,000,000

A schedule calling for the paving between tracks on approximately 50 miles of streets in Detroit, Mich., has been worked out by Del. A. Smith, general manager of the Detroit Department of Street Railways, according to an announcement by the department to the Detroit City Council. The estimated cost of the improvement is approximately $4,000,000. Mr. Smith said that the lack of paving on the various streets scheduled to be paved is reducing the usefulness of the streets and impeding the progress of the railway system.

A reduction of $2,500,000 in the department's gross earnings during the year 1926 hampered the expansion work, but it is anticipated that conditions will probably be such this year as to permit carrying on a large portion of the work. One of the larger projects scheduled for completion first is the section of Woodward Avenue between the Six Mile and Eight Mile Roads.

The proposal voted upon by the Detroit electors, which would have relieved the Detroit Street Railway of the expense of paving between tracks, was defeated by a substantial majority, although it was pointed out by the sponsors of the proposition that electric railways in many of the larger cities had been relieved of the burden, which was a relic of the days when the street cars were drawn by horses.

Unified System for Oklahoma City Advocated

George A. Henshaw, a retiring receiver of the Oklahoma Railway, Oklahoma City, Okla., issued a formal statement to the press on Jan. 9, expressing his appreciation of the co-operation of city officials and the newspapers in connection with the affairs of the company under the receivership. Mr. Henshaw served jointly with the late John W. Shartel, and after Mr. Shartel's death with G. T. Lackey. When the company went into receivership three years ago it was rapidly losing money, but the receivers in that short period, by intelligent management and by cultivating the good will of the public, were able to place the system on a paying basis. Mr. Henshaw, in his statement, praises the present officials and employees of the company, declaring them to be highly efficient and urges the advisability of keeping the entire transportation system of Oklahoma City in the hands of one company.

New Franchise Urged for Grand Forks

The necessity for a new franchise if service to Grand Forks, N. D., is to continue was stressed recently by T. J. Smith, president, and M. M. Odegard, manager of the Grand Forks Street Railway. Urging the granting of the franchise sought, the president said the company could survive only if put on a business basis, which included a fair return to the stockholders. He said that the state charter, which expired this year, should be extended, and this required the two-thirds vote of the stockholders. A reasonable return could be assured the stockholders by relieving the company from the paving and repair charges which have been imposed during the past fourteen years.

Mr. Odegard said that $50,000 to $100,000 should be put into additional equipment within the next ten years.

Weekly Pass in Ohio for $3.50

The Stark Electric Railroad since Jan. 23 has been offering a new weekly pass good between Alliance and Canton, Ohio, a distance of 18 miles, for $3.50.

Regular fare for a ticket over this line is 50 cents one way, or a bargain rate of 70 cents a round trip.

This ticket is of benefit to railroad and shop workers, who live in Alliance and work in Canton. It will also aid lawyers, court attendants and others since cars of the interurban stop in front of the County Court House.

$7,000,000 for Transportation in New Jersey

Budgets for 1928 of the operating companies of Public Service Corporation of New Jersey representing a total of approximately $37,000,000 have been approved. This expenditure is required for betterments in the transportation and other service supplied in New Jersey. Approximately $7,000,000 has been apportioned for transportation purposes for new equipment, replacements and general improvement of service.

Frank Hedley in Profile in the "New Yorker"

The soul of another millionaire strap-hanger has been laid bare—this time through the pages of the *New Yorker*. A personage no less imposing than Frank Hedley, president and general manager of the Interborough Rapid Transit Company, is made the subject of a sketch which condoles, condones, cavils, and caricatures the operating head of a great rapid transit system.

Like many others who inspire success stories this rapid transit genius comes from a family of workers. He himself left his home in England at the age of twenty and started at work in this country at $2.40 a day in the Erie Railroad machine shops in Jersey City. And now at the age of 66 he goes down to 165 Broadway every day with the inclination and ability to scrutinize detailed reports of delays and minor accidents of the previous day which occurred on a system over which he has assumed control for the past 24 years.

If Frank Hedley's name is associated with present-day transit trials, nevertheless it will be something to conjure with in the future planning of transit development.

Staggering To and From Work in New York

The stagger system was tested in New York on Jan. 23. Instead of reporting at 9 or 9:15 o'clock, as usual, the 10,000 employees of the Metropolitan Life Insurance Company arrived in four groups, the first at 8.30, the others at 8.45, 9 and 9.15. The first group went home at 4 o'clock in the afternoon and the rest followed at fifteen-minute intervals.

After watching in operation this plan he has sponsored for relieving subway congestion in rush hours, Dr. Louis I. Harris, Health Commissioner, said he would ask Mayor Walker to use his influence to obtain city-wide adoption of the stagger system. He expressed a special desire to see the Amalgamated Garment Workers, involving close to 100,000 persons, put it into effect. He said:

> I am going to make a report to Mayor Walker and ask him to use his influence in bringing home the value of the plan to industrial groups and accelerating city-wide adoption. I will suggest it also on behalf of the city employees, a fair fraction of whom are concentrated during the day.

Previous to Jan. 23 7,000 of the Metropolitan employees reported at 9 o'clock and 3,000 at 9.15. The 9 o'clock group is now reduced to about 3,000 and the other 7,000 are divided into three groups approximately equal in number.

$3,000,000 Spent by the Pacific Electric Railway in 1927

More than $3,000,000 was expended during 1927 in additions and improvements to various properties on the system of the Pacific Electric Railway, Los Angeles, Cal. As much or more will be necessary to provide for further planned improvements during 1928.

Outstanding in the improvements made in 1927 was the extremely large volume of trackage renewed with heavier rail. Throughout the system a total of 26,400 ft. was replaced.

The erection of two major grade separations, Pico Street and Hyperion Avenue, were the outstanding hazard removing additions during 1927. Four streets were separated by these two projects. Further safety measures were provided through the installation of 55 automatic wig-wag devices over the system, bringing the total of these devices to 555 now employed to warn of approaching trains.

New passenger station facilities were provided at the Hill Street subway station, at Santa Ana and at Pasadena, while at Long Beach a pretentious rebuilt station was completed. In addition numerous shelter stations were erected at various points over the system.

Other important improvements designated to improve the service were: new substations at San Gabriel, five de luxe motor coaches, overhead reconstruction and miscellaneous additions and improvements to bridges, buildings and other structures over the system.

Opposition Filed to Kansas City Short Line Project

Briefs urging the denial of a certificate of convenience and necessity to the St. Louis-Kansas City Short Line Railroad, which seeks permission to build an electric line between the two main cities of the state, have been filed by counsel for steam railroads operating between St. Louis and Kansas City with the Missouri Public Service Commission.

Six steam railroads would be affected adversely by the new line. The commission denied the application made in 1925 because the electric railway failed to make a proper showing of financial ability to carry through the project.

Lease for Suburban Service in Minneapolis Renewed

The Minneapolis, St. Paul & Suburban Railway, subsidiary of the Twin City Rapid Transit Company, Minneapolis, Minn., in suburban service, has renewed a lease made in March, 1906, with the Chicago, Milwaukee & St. Paul Railroad of the Minnetonka branch to Deephaven. It branches from the Excelsior line of the surburban company more than a mile west of Hopkins, and thence runs along the south shore of Lake Minnetonka. The lease has a 60-day written release clause by which either the railway or the railroad may cancel it. This formerly was a well-patronized steam line.

Interchange of Power Arranged at Providence

A frequency changer installed by the United Electric Railways, Providence, R. I., will permit an interchange of power between the company and the Narragansett Electric Company, both controlled by the Rhode Island Public Service Company. The interchange is planned only for emergency needs, with the railway intended as the principal beneficiary, since it puts at the railway's disposal all the available power of the electric company including that brought down from New Hampshire. The railway operates on 25 cycles, whereas the Narragansett power is of 60 cycles.

During rush hours the railway station is worked to capacity, while at off times during the day it is run light.

Eight Cents Sought in Ottawa

An 8-cent fare or seven tickets for 50 cents has been asked of the Dominion Board of Railway Commissioners by the Ottawa Electric Railway, Ottawa, Canada. The present fare is 5 cents.

Some time ago the company formally notified the city that it proposed to apply for an increase in fare for the five years beginning Aug. 14, 1928. It proposed a 7-cent fare or four tickets for 25 cents for adults, from six in the morning until midnight. For children instead of a 3-cent fare the company suggested a 4-cent fare or seven tickets for a quarter. No change was considered in the after midnight fares, 10 cents cash.

That application has apparently been amended to request an increase greater than was originally intended.

Only One Amendment at a Time in St. Paul

The Charter Commission at St. Paul, Minn., has rejected the proposal by the City Council to have the voters act upon an amendment to the charter at the March 13 primary election, which would put the city in the position of being able to indulge in bus operation on its own account. The Charter Commission feared that such presentation would militate against passage by the voters of a proposed amendment to enable the Council to give the railway relief from some of the burdensome costs of operation, such as was suggested by the State Commission two years ago when it ordered the present rate of fare of 8 cents and six tokens for 40 cents. The amendment has been voted down twice at previous elections.

Intracity bus operation is now a monopoly of the Twin City Motor Bus Company, a subsidiary of the Twin City Rapid Transit Company, as part of the intercity system. The revenue is included in the railway returns and any move that would tend to reduce the revenue of the St. Paul City Railway would simply be an argument for increased fare before the State Commission.

Furthermore the Charter Commission wishes the question involved in the railway amendment to be determined on its merits unhampered by other issues. The work of completing paving on streets that carry street car lines now awaits a clear cut verdict by the voters on the amendment intended to grant relief to the company from this burden.

The special committee of the Charter Commission held to the opinion that to submit a companion amendment would be an invasion in spirit at least under which the city has agreed to co-operate in giving the railway amendment a fair and impartial test at the polls.

In commenting upon the theory of proponents of the bus amendment that it is merely an enabling act that does not commit the city to bus operation, the committee said:

The answer to both arguments is that as a weapon the amendment cannot be effective unless it carries the authority to issue bonds without further vote of the people. No less an economic problem than that of municipal ownership is involved in the present situation. We do not believe that a matter so serious and far-reaching should be submitted without the most careful thought and the widest possible public discussion. Linked with other questions it cannot have that attention.

Lucky Riders in Richmond

Richmond, Va., shoppers on Friday shopping tours will ride free on a street car under a new system just put in effect by the Virginia Electric & Power Company. Every Friday the company will designate one car on some one of its divisions "The Lucky Shopper," and anyone boarding that car between the hours of 10 a.m. and 4 p.m. will be treated to a free ride at the expense of the company. When the passengers board they will be greeted by the motorman: "You're a lucky shopper, the ride's on us."

The experiment was started on the Highland Park Forest Hill line on Jan. 20 when the 258 passengers who rode were given pamphlets entitled "You're a Lucky Rider."

There is no distinguishing mark on the free car. As indicated in the newspaper advertisement the feature is designed to speed up shopping between 10 a.m. and 4 p.m.

Whether to Smoke to Be Voted Upon in Maine Sections

The smoking problem is to be voted upon by patrons of the York Utilities Company, which operates between Sanford and Biddeford, Me. Suitable ballots are to be provided, which may be marked "yes" or "no," and deposited in boxes to be placed on all buses and trolleys.

William M. B. Lord, general manager, has declared he does not know whether the people who ride in buses and cars wish to smoke en route and is taking this means to find out.

New Plan to Save Hocker Line

Efforts looking toward the restoration of service on the Hocker line, officially known as the Kansas City, Lawrence & Topeka Electric Railroad, may yet be successful as a result of a conference between officials of the Sonken-Galamba Corporation, purchaser of the line, and officials of the Kansas City Public Service Company.

Under a plan for assisting in the financing of the line and putting it into operation offered the Sonken-Galamba officials by the railway, it was agreed to purchase $15,000 in bonds providing the Sonken-Galamba Corporation took $16,000 in bonds; to furnish power for the line at cost and to lease four street cars to the line. Engineers of the Kansas City Public Service Company estimate that rehabilitation would cost approximately $16,000. The railway in Kansas City would receive a percentage of city fares on the line, which would run from the city market in Kansas City to Rose Hill, Kan.

Herman Sonken, president, said the Sonken-Galamba Corporation would accept the plan providing the communities along the line subscribed to $10,000 in preferred stock of the new company. To this the towns have agreed. The Hocker Line is twenty years old.

Recent Bus Developments

Higher Fares in Westchester

The Westchester Street Transportation Company, Inc., controlled by the Third Avenue Railway System has been authorized by the Public Service Commission to increase its fares on five days' notice on its White Plains-Tarrytown line from 5 to 10 cents in the zone between the New York Central station in White Plains and the west line of Elmsford and between the east line of Elmsford and the end of the line in Tarrytown. This company succeeded the Westchester Street Railroad, the property of which went into the hands of a receiver and was sold at mortgage foreclosure.

Evidence before the commission showed that on the lowest valuation of the company's property used in providing transportation service claimed by Tarrytown and Greenburgh, the two objecting communities, the new rates proposed would not provide revenue sufficient to pay operating expenses and a reasonable return on such valuation. It was also shown in the evidence that for the three months ended Sept. 30, 1927, the operating expenses and tax a day amounted to $334, while the operating receipts were $251. The operating statistics of the company, as submitted, were not challenged by the communities after their accountant had examined the books of the company.

Bus Succeeds Batavia Traction

After nearly six months without transportation facilities, the city of Batavia, N. Y., is to have a bus line as a successor to the Batavia Traction Company, which was forced to give up last summer because of failing revenue.

Earl P. Churchill and Arthur H. Sands, Batavia residents, have received a permit to operate a bus line and have purchased two 34-passenger buses. Messrs. Churchill and Sands, the holders of the new permits, expect to start operation of the bus service on a Main Street route at once.

Bus Rights Incite Trouble in Toledo

A petition which sets up ten violations of various state laws, city ordinances and regulations of the Ohio Public Utilities Commission has been filed by the Community Traction Company, against the Sylvania Buses, Inc., operator of a short interurban line from Sylvania into Toledo. Cancellation of the permit under which the bus line operates is asked.

The Sylvania Buses, Inc., has been competing with the railway on intracity business and was the chief offender against the ordinance passed by the city a year ago seeking to bar interurban buses from handling city passengers. Its recent application for permission to put on four new coaches was denied by the Public Utilities Commission. It was brought out at the hearing that one of these buses had been operating for several months and in the petition just filed it is claimed that equipment has been operated though not certificated, not insured or bonded under the utilities regulations. Violations of schedules and routes, and of the prohibitory ordinance of Toledo, are also cited as offenses which should be penalized by withdrawal of the company's certificate of convenience and necessity.

Buses on Alameda Line as an Experiment

Permission to discontinue operation over a portion of its San Jose Avenue line in the city of Alameda has been granted the Key System Transit Company, Oakland, Cal., by the California Railroad Commision. A trial is to be made of bus service for a period of 60 days.

Bus Service Extended in San Antonio

Regular bus service between Main Plaza and Kelly and Duncan Air Fields, San Antonio, Tex., is being supplied by the San Antonio Public Service Company. The fare is 25 cents cash or five tickets for a dollar.

Franchise Sought in Louisville

Grant would contain two general provisions: A city-wide operating right and regulation of that right administered by city. Statement of company's position in matter

THE Louisville Railway, Louisville, Ky., is asking for the creation and sale of a bus franchise. It suggests a city-wide operating right of a nature that, if acquired by it, will enable it to "use the new type of gasoline street car" to supplement and extend the transportation system now conducted by it by means of electric street cars. It assigns four reasons why it should have a bus franchise and why that franchise should be city-wide in its scope. Those four reasons are:

1. An analogy to the city-wide operating rights of all other Louisville utilities.
2. That, by using the new vehicle, it may round out and extend its present street car service.
3. That the dominant characteristic of the new vehicle, its mobility, may be invoked to the maximum benefit of operating company and traveling public.
4. That it may be protected from purely destructive competition.

PROTECTION ASSURED TO CITY

The company suggests that the broad operating right may well be protected by city executive restrictions to be imposed in respect of:

1. Starting bus routes—agreement.
2. Modifying routes in operation—discretion of company subject to.
3. Stopping bus routes—option of either city or company. As a corollary and to protect capital to be invested, initial right to extend automatically on future grant of competitive right.

Lastly, the company wants to combine capital and operation of electric street car and bus lines to the end that it may operate one complete and combined transportation system and not two competitive enterprises.

In its request to the city the company says:

The situation is this. A new type of street car has been developed. It is of advantage both to the transportation company and to the city that this new type vehicle be utilized for the service of the traveling public.

In order to operate this new type vehicle a franchise is necessary. Any bus franchise that carries over the fixed route idea of the rail street car line will automatically rob both company and public of that one character that makes the bus worth while, its mobility. A flexible franchise is necessary then for the operation of a flexible transportation line.

What safeguard should be interposed for the protection of the city? This is suggested: No line can be started without city assent; any line can be stopped by city fiat. In this state of case the city has parted with nothing it cannot take back. As far as the company is concerned it must and it is willing to stand or fall on its future showing of useful service; its operation is legalized and its investment depends upon its own ability to perform. The city risks nothing and the company backs itself.

Assuming a franchise created and acquired, how best to proceed?

The particular sections or routes where buses should be operated as well as the territory where parallel non-competitive service might be offered can be determined only after careful study and numerous experiments. For the good of both city and company the experiments should be as few and inexpensive as possible and advantage should be taken of all available studies of the city and its transportation system. It happens that within the past year a very careful and complete study has been made of these very things by at least three able and independent engineers.

The railway has retained John W. Burke, an engineer of wide experience, to revise its estimates of reproduction cost and sound value, while the city has engaged the Beeler Organization for the same purposes. These two, working independently, have made careful and complete studies of the city and the railway system. The company suggests their wide experience in matters of operation, car routing, etc., could be easily and promptly made available. It says:

Digitized by Google

There has also been completed a traffic survey covering the entire problem of surface traffic by Mr. Segoe, whose report to the Mayor's traffic committee is the basis of the traffic ordinance now pending.

Messrs. Burke, Beeler and Segoe have made independent studies of the cities' traffic problems from separate viewpoints and under separate engagements, and their data and studies, together with those of the railway, represent the expenditure of at least $150,000 for collection of such data. With so large and comprehensive a mass of data available it would be most unwise and improvident to submit to the method of trial and error problems of service and routing which might be solved in conference.

Much time and expense might be saved were these gentlemen engaged to make a recommendation as to routes and operations not merely of buses but of electric cars as well. With the studies of the railway itself could be combined the ideas and suggestions from these independent sources to the end that a complete co-ordination of electric car and bus service be worked out in the most expeditious and most economical manner. The observation of like operation in other communities which Messrs. Burke, Beeler and Segoe have had opportunity for, could be constructively applied to the situation existing in Louisville with the result of saving both time and expense in arriving at that plan of operation for Louisville transportation which would be most useful to the public and most productive to the company.

Concise Form of Franchise Submitted

The company attached to its communication to the city a concise form of franchise under which the developments suggested in its appeal could be accomplished. The suggested period of duration of the franchise is twenty years. On the matter of fares the proposed grant read:

Section 4.—Rate of Fare.—The holder of this franchise may charge and collect toll during the first two years operation hereunder at a rate not exceeding 10 cents for each passenger carried within the city limits with free transfers between bus lines.

Provided: If this franchise be acquired by a person or corporation operating, in Louisville, a system of electrically propelled street cars running on rails, or by a subsidiary of such corporation, then,

(a) Such person or corporation shall give transfers from bus to electric car or vice versa and may charge not exceeding 10 cents for a single bus ride, which shall carry transfer privilege to electric cars and not more than the differential between the electric car fare actually paid and the bus fare for a transfer from the electric car to bus, and shall give transfers at no extra charge from bus line to bus line.

(b) The rate of fare to be charged for bus rides shall be controlled in the same manner and upon the same principles as may govern the fixing of electric car fare.

(c) In adjustment of either bus fare or electric car fare, or both, the fixing of the rate or rates of fare shall be based upon the combined properties in electric railway service and bus service and through consideration of the expense of both operations, and not either or both fares upon consideration only of one group of property or expense. Determination of the fair value of property used and useful in bus service rendered hereunder shall be made under the direction of city authorities and the reasonable expense of such determination shall be borne by the holder hereof. Such valuation shall be undertaken immediately upon the acquisition of this franchise, shall be completed within 90 days, and shall have the same force and effect as the similar valuation of the properties devoted to electrically propelled car service, and fare adjustments may be made at any time after the completion of said valuation without regard to the two-year provision above mentioned. Said valuation shall be made and applied without sacrifice or surrender of any rights of owner or city under the law of the land. In such adjustments of fare, or fares, the charge for transfer between like or unlike vehicles shall be subject to adjustment upon the same condition or conditions as the base fare or fares.

Mayor Favors a Monopoly in Transportation

If bus and railway lines are coordinated under a bus franchise to the Louisville Railway, the fare should not be more than 7 cents, the present car fare, Mayor Harrison said on Jan. 23 in discussing the bus situation. The Mayor also announced that the basic principle of any bus franchise that he approves and signs must be that the city shall have a "direct right and means to compel" the buyer of the franchise to operate buses over Louisville streets wherever they are needed. In the opinion of the Mayor, with the buses and street cars operating as one unit, there would be no occasion for a higher fare than is charged at present.

No date had been set for the next conference of city officials with representatives of the company. When the latter believe they have arrived at a proposition which might be acceptable to the city or when city officials have worked out details of a possible solution, there will be further meetings, the Mayor said.

The Mayor favors a thoroughly regulated monopoly in principle, but said that if a monopoly on transportation is granted in a franchise the public should be protected to a greater degree than would appear to be possible in the company's proposal.

Bus Connections at Champaign and Danville with Interurban

Additional bus line connections at Champaign and Danville are now offered by the Illinois Traction System, Springfield, Ill. At Champaign the Pierce Arrow Bus Line Company, Inc., is operating bus service between Urbana-Champaign and Chicago. The buses of this company have their terminal at the Illinois Traction System station in Champaign, and schedules are so arranged that direct connection is made with Illinois Traction trains.

At Danville, Ill., the Egyptian Transportation System has started bus service connecting Danville, Lawrenceville and Albion, making connection at the latter point with other bus service of that company to Eldorado, Hillsboro, Vienna, Metropolis and Paducah, Ky. Buses of this company leave the Illinois Traction System station at Danville at 7 a.m. and 3:30 p.m. No passengers are carried on these buses between Danville and Ridgefarm. Tickets and baggage checking are handled at the Illinois Traction System station in Danville.

Buses for Marinette and Menominee

The Wisconsin Public Service Corporation, Green Bay, Wis., will spend $95,000 for new buses to be operated in the cities of Marinette, Wis., and Menominee, Mich., according to the 1928 budget of the company. All electric railway property in these two cities will be abandoned and sold. The total value of the railroad property to be supplanted by the buses was carried on the books at $435,000, divided as follows: tracks and roadway $307,000, buildings and shops $10,000, electric distribution equipment $33,000, and operating equipment $85,000.

New Bus Proposals Planned in Kansas City

Officials of the Kansas City Public Service Company, Kansas City, Mo., are working on the new bus plans to be presented to the City Council when the franchise expires.

These recommendations are said to have been decided upon, although it is probable that others will be added:

A new alignment of trunk lines, short enough to be profitable, and extending direct from the population centers to the downtown district.

Possibly purchase of new equipment.

New feeder lines to unserved sections, calling for the purchase of at least a dozen light buses.

Suggestion of a new trunk line fare, probably 15 cents or two rides for 25 cents.

Some substitution for present unprofitable Country Club Express service.

Feeder line fare to remain unchanged at 10 cents, with transfer privilege.

According to President Powell C. Groner, it may be a matter of weeks before he and his associates will be ready to go before the City Council with the new bus plan. It is felt that the main trunk lines which compete with existing railway service should be self-supporting, that those who choose to ride on a pneumatic-tired bus with a seat guaranteed, should pay a fare sufficient to meet the operating cost.

As for the feeder lines which supplement the railway Mr. Groner desires an extension of feeder lines, with à retention of a 10-cent fare and transfer privileges. At least a dozen new light buses will be needed.

After the company has worked out a conception of an adequate co-ordinated transportation system, public meetings will be held by the Council to develop other ideas.

Would Operate Coach Service in Glendale

The Pacific Electric Railway has applied to the California Railroad Commission for a certificate of public convenience and necessity to operate motor coach service in the city of Glendale.

Financial and Corporate

Improvement in Toledo in December—Year's Figures

For the first time in two years the monthly report of the Community Traction Company, Toledo, Ohio, showed a surplus. For December the amount was $2,807, due in part to the increased holiday business and to the readjustment of funds at the close of the year. There were carried on the system 4,167,159 passengers compared with 4,456,993 for a similar month the previous year.

Motor coach operation there accounted for 292,917 revenue passengers. They paid an average of 8.349 cents each, but operations resulted in a deficit of $4,360.

The year showed a deficit to the stabilizing fund after taking care of all ordinance requirements. This amounted to $361,825 compared with a deficit of $253,952 for the previous year. Most of this difference was directly attributable to decrease in riding due to prevalence of more privately owned automobiles in the city, bus competition, and slump in industrial conditions over recent months. Total operating revenue for 1927 was $3,408,386 compared with $3,539,774 the previous year. Total expense of operations was $2,615,184 for 1927 compared with $2,659,982 for 1926. One cut of $120,000 in maintenance was made during the year.

Passengers carried in 1927 numbered 47,033,227 compared with 50,011,654 the previous year. The company operated 6,388,975 revenue car-miles and 1,031,827 revenue coach-miles in 1927, and the previous year operated 6,667,419 revenue car-miles and 338,769 revenue coach-miles.

The ratio of expense and taxes in Toledo to total operating revenue was 81.294 in 1927 as against 80.310 in 1926.

Youngstown Line Bought

Control of the Youngstown & Suburban Railway, running from Youngstown to Leetonia, has been purchased by Samuel Insull & Son of Chicago. The line was originally built to connect the local steel district with the Ohio River, but was later electrified and operated as a passenger line.

New Deal in San Antonio

The San Antonio Public Service Company, San Antonio, Tex., plans to take over the assets of the South Texas Public Service Company and the Comal Power Company, which will be dissolved. The former will be known as the South Texas Department of the San Antonio Public Service Company, while the power station at New Braunfels will be known as the Comal Plant of the San Antonio Public Service Company. There will be no change in management or operating force of the two companies, due to the consolidation.

Purpose of City Utilities Company Explained

St. Louis Public Service Official States Case for Company to Act for Large St. Louis and Kansas City Holders

THE relations between the St. Louis Public Service Company, which operates the railway lines in St. Louis and St. Louis County, Mo., and the City Utilities Company, which has asked the Missouri Public Service Commission for permission to hold 40 per cent of the common stock of the operating company, have been described by Stanley Clarke, executive vice-president of the St. Louis Public Service Company, in a statement issued to the press. He said in part:

City Utilities Company, a Delaware corporation, has asked permission to own approximately 40 per cent of our outstanding stock. From facts already stated informally it appears:

1. That five or six large New York holders of our stock and 80 or 90 holders living in St. Louis wish to put their stock into a corporate unit. No one of them as an individual is able personally to look after his investment in our company or to afford alone the cost of employing competent employees to look after his investment in our operating company.

Therefore, these stockholders wish to form a pool to bear proportionately among themselves the expense of protecting their respective investments. Perhaps these stockholders should have unrestricted confidence in the operating managers of the railway to protect the investment of all stockholders; but their desire to have personal representatives keep track of their affairs is at no cost to anyone but themselves. Furthermore, any aid or assistance of a financial or other character which the corporate unit formed by these stockholders and its representatives is giving to our company is at the sole expense of these particular stockholders and no expense to the car rider.

2. This City Utilities Company is not a holding company in the usual sense in which that term is used, because it does not seek to own a majority of the outstanding capital stock of our company.

3. Not a cent of the expense of the City Utilities Company is paid by our company.

There are, however, many benefits which will accrue to our company if permission is granted to these 80 or 90 of our stockholders to put their stock into a unit, regardless of what name that unit is called.

To improve the service in St. Louis our company needs large sums of money. As an executive, I know the difficulty of securing funds with which to make improvements in service. Until the average investor believes what we now believe, namely, that when the public receives good service it will be willing to pay what it costs, our company must borrow from such people as are willing to invest more money to give better transportation, believing that by doing so they will safeguard the investment they already have.

Our company was able to borrow $1,000,000 unsecured, from the City Utilities Company made up of our stockholders.

The Public Service Commission of the state of Missouri would have no control over the corporate unit owning shares of our outstanding stock, and this would be true, regardless of whether such corporate unit was a foreign corporation or a Missouri corporation. The reason is that the jurisdiction of the Public Service Commission of Missouri is confined to operating public utilities, and its duties are to protect the users of the service furnished by such utilities.

The City Utilities Company is seeking to hold 40 to 42 per cent of the stock of the St. Louis Public Service Company not for the purpose of controlling the St. Louis railway system, but for certain advantages to be derived by the group forming the company and by other stockholders of the operating organization and the public. Col. Albert T. Perkins, vice-president of the utilities company, so declared in a deposition given to City Counselor Muench of St. Louis on Jan. 18. Colonel Perkins' testimony will be sent to the Public Service Commission at Jefferson City.

Advantages to be gained by the utilities company holding from 40 to 42 per cent of the operating company stock are listed by Colonel Perkins as follows:

Its officers could watch over and safeguard interests of stockholders, thus relieving individuals of that responsibility.

The company could render financial aid to the operating company by obtaining credit with greater facility and at lower interest rate.

The company could advise and assist the operating company on transportation problems and other matters.

Colonel Perkins stated that already the City Utilities Company has loaned the Public Service Company $1,000,000 to aid in the reorganization of the city lines. The holding company acquired no security and is charging only 5½ per cent interest. He said the operating company would have been forced to pay a much higher rate of interest had it secured the money elsewhere.

Colonel Perkins said that the $1,000,000 was obtained from the Central Union Trust Company, New York, after the utilities company put up sufficient securities as collateral. He said that no charge for services rendered the railway has been made to date and no charges for future services are under contemplation at the present time. He added, however, that if specific work is called for on a large scale outside of the general advisory functions a proper charge will undoubtedly be made.

Counselor Muench for the city endeavored to show that if the holding company could control the operating company it could also fix the value of the service rendered. He said:

If you control the election of directors and elect a friendly board, then, of course, you could rely on the board employing the holding company to render services rather than an outside company.

"Far-fetched, but possible," Colonel Perkins replied.

Extension Granted to West Chester Holders

An extension has been granted until Jan. 31 to security holders of the West Chester Street Railway, West Chester, Pa., in which to deposit their holdings under the terms worked out for the readjustment of the securities of the company. The time limit fixed originally for such deposit was Dec. 31, 1927. Announcement has been made that a large part of the securities have already been deposited. The appeal is addressed to the holders of the first mortgage 5 per cent gold bonds, due Aug. 1, 1932, first lien and collateral trust sinking fund gold bonds, Series A 6 per cent, due Oct. 1, 1939, 7 per cent participating cumulative preferred stock, common stock and secured promissory notes.

Spokane United Railways in Merger Deal

H. T. White, New York, chairman of the finance committee of the Washington Water Power Company, Spokane, Wash., and officers of the American Power & Light Company on Jan. 18 stated that subject to necessary corporate action and legal arrangements, it has been agreed that all holders of Washington Water Power common stock will be offered an opportunity for prompt exchange of their stock for American cumulative preferred stock no par value, paying $6 a share annually, in the ratio of 2.2 shares of American stock for each share of Washington Water Power common stock. The offer is conditioned on acceptance by a sufficient percentage of the shares of water power common stock.

According to a statement to the New York Stock Exchange, the American Power Company's authorized $6 no-par cumulative preferred stock would be increased from 500,000 shares to 2,000,000 shares and the authorized no-par common stock, from 2,300,000 shares to 4,000,000 shares.

While a merger of the Washington Water Power Company with American Power, now under way, would require the issue of a considerable amount of American Power preferred stock, it is not believed this would account for the proposed increases in American Power's capitalization. There are $23,091,400 par value of Washington Water Power common shares outstanding. If all these are deposited under the merger offer, there would be 508,000 shares of American Power required for their exchange.

The Washington Water Power Company owns a controlling interest in the Spokane United Railways.

Interest on Chicago Railways Bonds Ordered Paid

Payment of interest due on Feb. 1 on $55,655,000 of first mortgage 5 per cent bonds of the Chicago Railways, Chicago, Ill., was ordered by Federal Judge Wilkerson in the United States District Court. In the matter of interest on $37,941,275 of junior mortgage bonds, also due at that time, the receivers were directed to hold sufficient funds for interest on those issues if the court should order payment, after deciding certain points in controversy.

Discontinuance of Non-Paying Line in California Refused

Reaffirming its stand against permitting a utility to abandon its non-paying properties, and to retain only paying properties, the California Railroad Commission denied the application of the Central California Traction Company to abandon service over its Sunnyside Line, partly within and partly outside the city of Stockton. The commission found that public convenience and necessity required the operation of the line in question, since patrons would be required to walk more than ½ mile if service were withdrawn.

In accepting the franchises, the commission ruled, a carrier obligated itself to furnish service to the community as a whole. Further it was almost universal that railways in furnishing such service expected and often operated non-paying ends of lines. In the present case the applicant leased to the Stockton Electric Railroad all of the existing local system covered by these franchises, with the exception of the line on which it now sought to discontinue passenger service. In the opinion of the commission it was possible that the Central California Traction Company was unfortunate in that it had retained a decidedly unremunerative portion of that system; but the fact that it had chosen to divest itself of the better paying lines was no adequate reason why the public, who depended on the non-paying end for service, should suffer. The commission stated that its policy had never been to permit railways to select for operation only the income-producing portions of their lines and abandon those portions which, because of their distance from the center of population or because of other reasons, were not, in themselves, self-supporting.

New Interests in Groton & Stonington Road

F. E. Kingston & Company, New Haven, Conn., have acquired the majority of the first mortgage bonds and the shares of stock of the Groton & Stonington Traction Company, Norwich, Conn. Sale of the mortgage bonds and stock of the company was made on the advice of the stockholders' protective committee and represents the holdings of 75 per cent of the stockholders. The protective committee was named two years ago following default of interest by the Groton & Stonington Street Railway. The Kingston company paid $425 for each $500 first mortgage bond, with which was included ten shares of stock.

P. LeRoy Harwood has resigned as treasurer and director, and Lucius E. Whitton, New London, and Clarence Thompson, New Haven, have resigned as directors.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

†This index is changed to a base of "1926 = 100." That notation replaces the former basis of "1913 = 100." Inasmuch as the bureau has not calculated the index on this new base any further back than January, 1923, no figures are shown in this tabulation for the high and low points since the war. It is planned to compute the index on the new basis as far back as January, 1913. Until such time as the bureau makes public these figures for the earlier years this information will be lacking.

Default of Interest Looms on Puget Sound Electric Railway

Semi-annual interest due last Aug. 1 on the $2,427,000 bonds of the Puget Sound Electric Railway has not been paid, and default looms again on Feb. 1, when next bond payments are due. It is problematical, executives admitted recently, whether the Tacoma Railway & Power Company will be able to pay interest due on April 1 on its $1,200,000 bonds. Principal on this entire bond issue is due April 1, 1929.

The Tacoma Railway has operated for some years without a franchise under varying plans intended to put the property on a paying basis. Mayor M. G. Tennant expresses the conviction that eventually the city will operate its system of transportation. The city's position, he states, now is that before it can arrive at any satisfactory relations with the Tacoma Railway & Power Company the company will have to change its valuation at Olympia for rate-making purposes.

The circumstances surrounding the affairs of the Puget Sound Electric Railway were reviewed at length in ELECTRIC RAILWAY JOURNAL for July 30, 1927, page 209.

Another Merger Proposal in Washington

Merger discussions at Washington, D. C., were revived on Jan. 20 when Major Clayton E. Emig, former vice-chairman of the public utilities committee of the Federation of Citizens' Associations, submitted to John W. Childress, chairman of the Public Utilities Commission, a brief outlining his own ideas for bringing about the long-advocated consolation.

Major Emig referred to his plan as "suggestions on merger of Washington's transportation lines." It appears, however, to contain a combination of the cardinal features of the three different schemes for consolidation proposed by Harley P. Wilson, owner of the Washington Rapid Transit Company; B. BcK. Bachman, chief accountant of the Public Utilities Commission, and Charles Hansel, specialist. The latter firm, it was recalled, prepared a merger plan at the instance of Major Emig for the utilities committee of the federation.

Major Emig borrowed from the Hansel plan the idea of extensive use of one-man street cars, which he said would save the consolidated company $900,000 a year. From the Wilson plan he took the $50,000,000 valuation for a merged company and a return of 7 per cent, which he said should be guaranteed for a period of 50 years. The Bachman plan was quoted for authority that under merged operations the companies could save $1,500,000 a year.

Meanwhile representatives of the Washington Railway & Elcetric Company, the Capital Traction Company and the Washington Rapid Transit Company have been holding conferences on the merger subject and the merger sub-committee has been functioning at the instances of the board of directors of the three systems affected.

Banker Takes Up Preferred Issue of Railway in Receivership

Several hundred Des Moines investors in 7 per cent preferred stock of the Des Moines City Railway, Des Moines, Ia., now in receivership, will receive the par value of their stock together with accrued dividends up to Jan. 1, 1928, through the almost unprecedented generosity of A. W. Harris, Chicago, chairman of the board of the Harris Trust & Savings Bank, trustee of both the bonds and the debentures of the railway. He has authorized the Iowa National Bank, Des Moines, to take up the $100,000 of outstanding stock in the hands of local purchasers at the original cost to them, and in addition to pay dividends up to the first of the year 1928.

Mr. Harris was, of course, under no legal or moral obligation to redeem the stock, as the receivership was unforeseen at the time the stock was sold and resulted from no action of his. However, those who know his feelings in the matter declared the banker was unwilling that Des Moines patrons of the company should lose through their purchase of stock, and that he was determined to keep their confidence.

Homer Miller, president of the Iowa National Bank, said that so far as he knew, the action of Mr. Harris was without precedent in American business, and that it proved beyond a doubt the integrity of the man who has backed the Des Moines railway for years past.

The stock was sold in 1922 and 1923 following the granting of the present service-at-cost franchise in the latter part of 1921. The sale resulted in a wide distribution of the stock locally, and did much to build up the strong public sentiment which now registers in Des Moines for the city railway company.

The stock would probably have been a complete loss to the buyers, with the exception of the dividends which have been paid regularly, except for the generosity of Mr. Harris. The railway will undoubtedly go to sale under the receivership, and few in touch with the situation believe that the amount realized will more than cover the first mortgage bonds and the debentures.

W. H. Sawyer Made Receiver of Ohio Road

Judge Frank M. Krapp of the Common Pleas Court of Springfield, Ohio, on Jan. 26 appointed W. H. Sawyer, Columbus, receiver for the Springfield Railway. The proceedings were brought by the Transit Improvement Company, to which the Springfield Railway owes $680,000 and which has acquired and now owns the stock of the railway. A large part of the money owed to the Transit Improvement Company was advanced for bond interest and payment for franchise tax and paving assessments.

It is hoped by those interested in working out the difficulties of the Springfield property that the city and the receiver will join in a survey of the entire problem with a view to giving Springfield the best practicable service and putting the company in a financially healthy condition so that it may be able to finance new improvements and furnish service beneficial to the community.

Notes for Fort Worth Public

The Northern Texas Traction Company, Fort Worth, started the sale of 6½ per cent, 3-year notes to the public on Jan. 26. The total issue is $1,500,000, of which $1,000,000 is being taken by bankers and $500,000 is to be placed locally with the public at a price of 98 per cent of par.

Removal Sought of a New York City Line

Purchase and removal by New York City of the Madison Avenue line of the New York & Harlem Railroad is asked in an application filed with the Board of Estimate, it was announced on Jan 20 by the Fifth Avenue Association.

$1,250,000 Power Issue Offered

Whitaker & Company, St. Louis, Mo., and W. L. Ross & Company, Chicago, Ill., are offering at 100 and accrued interest, to yield 5.25 per cent, $1,250,000 of Oklahoma Power Holding Company first (closed) mortgage 5¼ per cent sinking fund gold bonds dated Jan. 3, 1928, and due Jan. 1, 1943. The proceeds of the sale of the bonds will be paid to the Oklahoma Railway as part of the purchase price of the property.

The Oklahoma Power Holding Company was organized under the laws of Delaware in December, 1927, to acquire the electric power plant heretofore owned and operated by the Oklahoma Railway, Oklahoma City. The property consists of a modern plant located at Oklahoma City with a present installed capacity of 13,750 kw.

The property is leased under a contract to the Oklahoma Gas & Electric Company, for a period of 22 years, for a basic annual rental of $225,000, plus taxes and full maintenance. The Oklahoma Gas & Electric Company also assumes the contract between this company and the Oklahoma Railway covering all the latter's power needs.

The bonds will constitute, in the opinion of counsel, a first mortgage on all the property of the company, subject to the contract to furnish the Oklahoma Railway its power requirements. A physical examination of the property by the engineering department of the Community Power & Light Company showed a present depreciated value of $1,714,751. The entire issue of common stock of the Power Holding Company is controlled by the Oklahoma Railway.

Personal Items

Promotions and Appointments in Brooklyn

IN RECOGNITION of worthy records five employees of the Brooklyn City Railroad, Brooklyn, N. Y., were promoted Jan. 1. These men and their new positions are as follows:

R. A. Masters, superintendent of transportation.

F. J. Brennan, assistant superintendend of transportation.

L. H. Hoyer, division superintendent at Fresh Pond.

E. M. Fletcher, depot master at Fresh Pond depot.

L. H. Hoyer and L. E. Loomis succeed Messrs. Masters and Brennan. E. M. Fletcher succeeds Mr. Hoyer as depot master at Fresh Pond depot.

James J. Duffy was appointed supervisor of employment and school for conductors and motormen.

R. A. Masters, the newly-appointed superintendent of transportation, has had nearly 25 years of experience in the railway industry. He started work as a conductor in 1904 with the Indianapolis Traction & Terminal Company, where he remained for three years. He then entered the interurban field as conductor on the Ben Hur Route between Indianapolis and Crawfordsville. At that time Clinton E. Morgan, vice-president and general manager of the Brooklyn City Railroad, was general manager of this line. From 1909 to 1910 Mr. Masters worked as fireman on the "Big Four" division of the New York Central lines. He returned to the electric railway field in 1910 with the Union Traction Company at Indianapolis. Three years later he went to Jackson, Mich., to work for the Michigan United Traction Company and the Michigan Railroad, finally supervising operation of this company's line between Grand Rapids and Kalamazoo.

Mr. Masters joined the organization of the Brooklyn City Railroad in January, 1920, and has been division superintendent in charge of the Halsey Street division and later the Fresh Pond division. His headquarters will be at 85 Clinton Street.

On Mr. Masters' staff will be F. J. Brennan, assistant superintendent of transportation, who will also have charge of the traffic bureau and the schedule department. Mr. Brennan was advanced to this rank from the position of division superintendent at Maspeth. His assistant also has had varied experience in surface car operatino, but all in New York City. He began his railroad career in 1905 as a motorman at 58th Street depot. After a year he resigned but returned in 1907 as a motorman. In 1909 he was transferred to the Ninth Avenue depot, where he served as a stenographer and mileage computor. In 1911 he was appointed to the Public Service Commission staff as inspector of surface car operation, and was promoted finally to the post of supervisor of inspectors by the Transit Commission.

Men Advanced by the Brooklyn City Railroad

1. Leo E. Loomis
3. L. H. Hoyer

4. R. A. Masters
6. E. M. Fletcher

2. F. J. Brennan
5. J. J. Duffy

Mr. Brennan returned to the Brooklyn Company in 1921 as supervisor of headways, and later was in charge of operation for the Brooklyn Bus Corporation, a Brooklyn-Manhattan Transit subsidiary. From March, 1925, until January, 1927, he was superintendent of maintenance and operation of the Municipal Trolley Lines on Staten Island. A year ago he became division superintendent at Maspeth depot.

Mr. Brennan is a native of Brooklyn. He was graduated from Erasmus Hall High School and also studied at Pratt Institute.

Mr. Hoyer, the new division superintendent at Fresh Pond, advances to his post as division superintendent from that of day depot master at Fresh Pond depot. His railway career also dates from 1904, when he started as a conductor in Manhattan. He went to Brooklyn in 1905 and has served ther as motorman, instructor of motormen, inspector of instructors and depot master and has worked at the East New York, 23rd Street, Ridgewood, Flatbush and Fresh Pond divisions.

Mr. Loomis, appointee to the Maspeth station, goes to the Brooklyn City

Digitized by Google

organization from the West. For the past sixteen years he has been with the Michigan Electric Railway, Jackson, Mich. He first served the company as conductor and motorman in Battle Creek, beginning in March, 1911, and after two years was promoted to interurban motorman. During the year 1917 he was made train dispatcher and rapidly rose to be chief dispatcher. In 1923 he accepted the position of superintendent of the city car lines in Jackson, Mich. Just prior to going to Brooklyn, Mr. Loomis was superintendent of the bus line subsidiary of the Michigan Electric Railway, the Southern Michigan Transportation Company.

Edward M. Fletcher, now depot master at Fresh Pond, started in the railway industry in September, 1913, in the office of the general manager of the Virginia Railway & Power Company, at Richmond. In June, 1918, he began his apprenticeship in the operating field as a conductor, motorman and operator, and from January, 1922, until October, 1925, he served as a line inspector during morning and evening rush hours. He resigned his position with the Richmond property in November, 1925, to accept a position on the staff of the vice-president and general manager of the Brooklyn City Company.

Mr. Fletcher was born in Richmond. He attended public and private schools there.

James J. Duffy, now supervisor of employment and school for conductors and motormen, has spent his entire career as a railway operator on the Brooklyn surface lines. He was appointed motorman at Canarsie depot on Feb. 3, 1906. He advanced through the ranks of register taker, starter and register inspector at Canarsie depot in the next eight years and after a short period as a road inspector at Halsey Street depot, was made chief instructor at the 58th Street schoolroom on March 16, 1915. Mr. Duffy has spent the last thirteen years in the instruction branch of the service.

C. C. Slater President in Columbus

C. C. Slater, formerly vice-president and general manager of the Columbus Railway, Power & Light Company, Columbus, Ohio, was elected president at the annual meeting of stockholders and directors on Jan. 24. He succeeds Cyrus S. Eaton, of Cleveland.

Lyle Babbitt, secretary and auditor, will also serve as vice-president.

A. C. Beck, formerly assistant treasurer, is now treasurer.

Arthur dur Perron Succeeds Paul Seurot at Montreal

Paul Seurot, chief engineer of the Montreal Tramways Commission, has resigned in order to accept the position of rapid transit engineer for the Montreal Tramways, Montreal, Que.

Arthur dur Perron, civil engineer. Montreal, and professor of engineering at the Montreal Technical School, has been appointed chief engineer to succeed Mr. Seurot.

C. D. Porter Goes to Omaha

Made vice-president and general manager of property under the presidency of J. N. Shannahan

C. D. Porter, vice-president and general manager of the Virginia Public Service Company, successor to the Newport News & Hampton Railway, Gas & Electric Company, will resign on Feb. 1 to accept an appointment as vice-president and general manager of the Omaha & Council Bluffs Railway, Omaha, Neb., of which J. N. Shannahan was recently elected president. Mr. Porter became vice-president and general manager of the Newport News & Hampton Railway, Gas & Electric Company in April, 1921, succeeding E. F. Peck, who was compelled to give up active work on account of ill health.

C. D. Porter

Mr. Porter was in charge of track construction in Washington, D. C., under Mr. Shannahan, after which he went to the New York Central as location engineer in charge of field work. Later he returned to be chief engineer of the Newport News & Hampton Railway, Gas & Electric Company, where he was in charge of all physical property and its upkeep. When Mr. Shannahan was elected president of the Maryland Electric Railway of Baltimore, Mr. Porter went with him as vice-president and general manager of its interurban line between Baltimore and Annapolis, remaining with that company until its absorption by the Washington, Baltimore & Annapolis Electric Railway. Upon completion of his work there Mr. Porter succeeded Mr. Peck on the Newport News & Hampton property and was with that company during the reconstruction period immediately succeeding the War.

In the recent utility mergers this property was absorbed by the National Public Service Company and Mr. Porter was retained as its vice-president and general manager, resigning to serve again with his former employer, J. N. Shannahan, in his work in Omaha.

The new assistant in Omaha is 44 years old. He is a graduate civil engineer of Renselaer Polytechnic Institute.

G. C. Baggett Named Superintendent of Houston Interurban

Grover C. Baggett has been promoted to the superintendency of the Galveston-Houston Electric Railway, Houston, Tex. In this capacity he succeeds Superintendent Howard, who left the services of the company some time ago.

Mr. Baggett went to Houston from Alabama in 1909 and became a conductor on the local railway lines. Two years later he was made a conductor on the interurban lines. In 1915 he was promoted to the position of dispatcher for the interurban and remained in that capacity until 1925 when he was made chief dispatcher.

Nomination of C. R. Porter to I. C. C. Approved

Approval was given Jan. 20 by the Senate Interstate Commerce Committee to the nomination of Claude R. Porter of Iowa to succeed Henry Hall of Colorado as a member of the Interstate Commerce Commission.

W. V. Drake in New Post With Monongahela Power System

W. V. Drake has been selected to fill the newly created position of superintendent of power plants of the Monongahela System according to a recent announcement at the office of Captain G. M. Alexander, president of the Monongahela West Penn Public Service Company. Mr. Drake, who will be located in Fairmont, already has assumed his new duties. For the past seven years he has been assistant to J. E. Thomas, superintendent of power plants for the West Penn Power Company, with main plants at Springdale and Connellsville, Pa.

Mr. Drake was named for the new position by H. A. Holmes, Fairmont, general superintendent of the power department. He stated that the new official would have general supervision of the operation and maintenance of all power plants of the company. These plants are located at Rivesville, Hundred, Parkersburg, Elizabeth, Grantsville and Sutton.

MAXWELL DABRITZ, former conductor on local lines of the International Railway, Buffalo, N. Y., has been appointed district manager in charge of the Seneca station. The new manager entered the employ of the International Railway in 1912. Two years later he was promoted to station clerk at the Hertel station and in 1927 was made master of the Hertel station. In his new capacity Mr. Dabritz succeeds District Manager Hooley of the Seneca station, who has been transferred to the Hertel station, succeeding John Reichel, who has been appointed special investigator.

Manufactures and the Markets

Details of $1,170,669 Expenditure by Narrow-Gage Line

Data have been filed by the Boston, Revere Beach & Lynn Railroad with the Massachusetts Department of Public Utilities covering the estimate of the cost of electrifying the road. The total cost figure is placed at $1,170,669, divided as follows:

Car equipment	$597,564
Substations	215,769
Trolley line and feeders	124,850
Turnstiles and station changes	58,961
Signal changes	177,500
Track bonding	18,700
Buses and truck	22,325
Shop machinery and tools	15,000
Total	$1,230,669
Estimated salvage from sale of steam locomotives	60,000
Net total	$1,170,669

The details of the car equipment expenditure of $597,564 broken down into individual items follow:

CAR EQUIPMENT	
60 Passenger Motor Cars	
Electric equipment at $3,975	$238,500
Air brakes at $925	55,500
Trucks at $985	59,100
Heaters at $275	16,500
Labor at $1,200	72,000
Painting at $300	18,000
Installing leather seats twenty cars at $624	12,480
Six Work Motor Cars	
Electric equipment at $6,800	$40,800
Air brakes at $875	5,250
Trucks (two) at $985	5,910
Labor at $1,300	7,800
Six Passenger Trailers	
Heaters at $275	$1,650
Equipment at $250	1,500
Air brakes at $925	5,550
Painting at $300	1,800
Labor at $150	900
Total for all cars	$543,240
10 per cent for engineering contingencies, freight and overhead expenses	$54,324
Total	$597,564
Buses and Truck	
Three coaches, 23-passenger, street car type, six cylinders at $6,275	$18,825
One 2-ton truck	3,500
Total	$22,325

The so-called narrow-gage road passed recently to the control of Hemphill & Wells, New York, as told in detail in ELECTRIC RAILWAY JOURNAL for Dec. 10, page 1076.

Committee Approves Minneapolis Street Railway Budget

The street railway committee at Minneapolis, Minn., has approved a $705,000 budget expenditure for 1928 by the Minneapolis Street Railway. Four extensions of existing lines include: Chicago Avenue, six blocks; Bloomington Avenue, four blocks, eliminating the present line on Cedar Avenue from 50th to 52nd and on 52nd to Bloomington; Nicollet Avenue line, four blocks into the newly acquired Richfield district; Bryn Mawr, six blocks; doubling track five blocks on Washington Street NE.; doubling track West Broadway Penn Avenue to city limits. Other relaying of rails and special work will take the remainder of the budget.

Confer on Type of New Cars for Cincinnati Street Railway

Announcement was made on Jan. 18 at the offices of the Cincinnati Street Railway Co., that conferences are being held between officers of the company and various car builders concerning the purchase of new street cars for Cincinnati.

The matter has also been presented to Edgar Dow Gilman, director of public utilities, who will be called upon to approve both the type of cars and also the plan of financing their purchase.

Walter A. Draper, president of the railway, is reported to have said:

> The policy of this company, when it took back the operation of its property a little more than two years ago, has been first to reconstruct a large portion of its track, and then to purchase new cars.
>
> We have now proceeded so far with our track reconstruction program that I feel that the time has arrived for the purchase of new equipment to operate over the improved track.
>
> While we have not decided on the exact type of car, we have been making a study of various types for several months, both here and elsewhere, and have been conferring with several car builders in order that our new cars may be the best and most efficient type obtainable.

Sales of Incandescent Lamps Increase in 1927

Sales of incandescent lamps in the United States during 1927 total approximately 320,000,000 large size and 218,000,000 small lamps, according to a review of the electrical industry for the year by John Liston of the General Electric Company. This is an increase of about 8,000,000, or 2½ per cent, in the large sizes over 1926 and 16,000,000, or 8 per cent, in the small sizes over the previous year.

HEARKEN

to the wee small voice that calls you to

Cleveland

Sept. 22-28, inclusive

When it urges you to plan for a display at the 47th convention and exhibit of the A. E. R. A. Do it now!

Meeting of New Exhibit Committee Called

Col. J. H. Alexander, chairman of the exhibit committee of the American Electric Railway Association, has called a meeting for 10 a.m. Wednesday, Feb. 8, at his office with the Cleveland Railway in the Hanna Building, Cleveland, Ohio.

This is the first meeting of this committee and is called for organization purposes, to approve layout and floor plan showing detailed space arrangements with booth dimensions for the convention at Cleveland next Sept. 22-28 inclusive, and to consider such other matters as might properly come before the meeting at that time.

New Managing Director for Westinghouse of Japan

At a recent meeting of the board of directors of the Westinghouse Electric Company of Japan, J. W. White was elected a director and managing director of that company.

Mr. White has been respectively general manager of the Japan company, manager of the power section of the Detroit office, and manager of the Westinghouse International Company of Cuba.

New Cars for New Orleans Ready

Delivery is being made of the first of the twenty new street cars for the New Orleans Public Service, Inc.

Details of these cars, ordered in Aug., 1927, were carried in the issue of the JOURNAL for Oct. 15, 1927. Ten of the cars were ordered from the St. Louis Car Company and ten from the Perley A. Thomas Car Company.

They are all-steel one-man two-man double-truck double-end cars. Each has a seating capacity for 52 passengers and weighs 40,000 lb. The cars are equipped with four treadles per car, one in each corner because of operating conditions on Canal Street in New Orleans.

Slightly Higher Metal Prices

The prices of copper, lead, zinc, and tin were all slightly higher Jan. 25 than a week ago, though the market had not been active.

Excellent sales in the export market during the last two or three days have been a marked influence in removing the pressure to sell on the part of the custom smelters. The copper that was available from such sources until Jan. 23 at 14 cents for Eastern deliveries is no longer obtainable, and all sales Jan. 24 and 25 have been on the 14⅛-cent, Valley, basis. From Jan. 19 to 23, inclusive, the larger lots were sold at or near the 14-cent level in the East and 14.20-cent in the Middle West, with occasional sales up to the 14⅛-cent level, at which some special lots were purchased.

Foreign prices continue unchanged at

Digitized by Google

14½ cents, c.i.f., and from 14.25@14.35 cents, f.a.s.

Prices for lead, not only in New York and St. Louis but in London, are virtually unchanged from a week ago. The American Smelting & Refining Company has maintained its contract price in New York at 6.50 cents.

Sales of zinc, like those of copper, have been well below normal, with about 2½ points difference between sellers' and buyers' ideas of the market. Judging by the gradual advance in the price, from 5.60 to 5.65 cents, sellers apparently have had more ground for their belief than buyers. Jan. 25 some quotations were made as high as 5.675 cents.

The tin market is dominated by buyers rather than sellers. Recent reports of exceptionally small shipments from the Straits, which a year ago would have caused a sharp advance in London, had only a slightly bullish effect on the other side, and in the domestic market almost no effect at all. In spite of the fact that the current prices are about 13 cents under those of January, 1927, and 10 cents under the average for the entire year, consumers are not satisfied to consider it "cheap." They may be wrong, but they feel they can afford to take the chance. Consumption in the automobile industry and by the tin-plate interests has picked up materially, but at the same time there is every evidence of a higher production rate in the Far East, so that the relative position is little changed. Tin of 99 per cent grade brings within ½ cent of Straits.

Rolling Stock Replacements Planned in Port Arthur

Eastern Texas Electric Company, which purchased the railway property of the Port Arthur Traction Company at public auction on Jan. 10, plans to rehabilitate that property and improve the service. Most of the rolling stock of the company will be replaced with more modern equipment, and the service previously operated by the company will be supplemented with buses, which will be operated in territory not previously served. The Eastern Texas Electric Company operates the railway lines in Beaumont and an interurban line between Beaumont and Port Arthur.

ROLLING STOCK

PUBLIC SERVICE TRANSPORTATION COMPANY, Newark, N. J., has just placed an order with the Yellow Coach & Truck Manufacturing Company, Chicago, Ill., for 331 Yellow Type Z gas-electric buses, for use on its lines in Newark and other cities.

DEPARTMENT OF STREET RAILWAYS of the city of Detroit, it is reported, will ask for bids on 25 to 100 new motor coaches.

TWIN CITY RAPID TRANSIT COMPANY, St. Paul, Minn., has accepted delivery on six Mack bus chassis, 230-in. wheelbase, four-cylinder motors, model AB.

BOSTON ELEVATED RAILWAY, Boston, Mass., has accepted delivery of a White Model 50-B bus.

TRADE NOTES

RAILWAY TRACK WORK COMPANY, Philadelphia, Pa., has recently sold the Chicago Surface Lines a "Vulcan" rail joint grinder and three "Atlas" rail grinders.

NUGENT STEEL CASTINGS COMPANY, Chicago, Ill., has appointed Van Cortright Mekeel as special representative. Mr. Mekeel was formerly connected with the Taylor-Wharton Iron & Steel Company of High Bridge, N. J., as special research investigator, mechanical engineer and sales engineer.

FRANK W. GORMAN became associated on Jan. 1, 1928, with the Ohio Brass Company, Mansfield, Ohio, as district sales representative with headquarters in El Paso. Mr. Gorman, formerly with the Mine & Smelter Supply Company, El Paso, relieves L. M. Keating, who has moved to Mansfield, Ohio, to assume new duties in the general sales department of the Ohio Brass Company. The territory in which Mr. Gorman will operate includes Arizona, the Panhandle of Texas, New Mexico and Mexico.

TIMKEN ROLLER BEARING COMPANY, Canton, Ohio, announces it will occupy spaces Nos. 414-415 at the Mid-West Power Conference at Chicago, Feb. 14 to 18. Those representing the company at the exhibit will be L. M. Klinedinst, G. D. Thewlis, R. P. Proffitt, R. W. Ballentine, G. W. Curtis and R. P. Kelley.

COPPERWELD STEEL COMPANY, with the removal of its main office from Rankin to its new 20-acre mill at Glassport, Pa. announced that the headquarters of both the sales and engineering departments would be at Glassport. The personnel of these departments as now constituted, is as follows: Robert J. Frank, vice-president in charge of sales; Stanton Hertz, formerly electrical engineer, becomes sales manager; Rolf Selquist, formerly assistant electrical engineer, has been appointed electrical engineer; William Jay McIlvane has been appointed district engineer, with headquarters at New York, N. Y.; Erich G. Elg becomes district manager with headquarters at Chicago, Ill. The company has also recently announced that S. H. Burr has joined the engineering department of the company, with headquarters at New York. He was formerly inspector and line material specialist at both the Buffalo and New York offices of the Graybar Electric Company.

BRIDGEPORT BRASS COMPANY, Bridgeport, Conn., is opening a Boston office in its home territory. From the foundation of the company, in 1860, to the present time, New England industry has been serviced out of Bridgeport, and now the company, it is stated, finds it necessary to provide more and speedier service to its New England customers. In charge of the office will be William J. Hawkins, who has been associated with the company for more than twenty years. The office is in the Park Square Building, No. 1060, in the Back Bay District, a short distance from both the Copley Plaza and the Back Bay Station.

ADVERTISING LITERATURE

AMERICAN ASPHALT PAINT COMPANY, Chicago, has issued an artistic booklet entitled "In the Long Ago." The cover and text illustrations are the work of Lone Wolf, the Blackfeet Indian artist. A distinctive feature of the cover is an Indian teepee against a background of blue mountain ranges, that blend with other colors of green and black. The text deals with the discovery of "Gilsonite Asphalt" and with its history interwoven with the history and life of the West. Attention is directed in the booklet to the advantages of "Valdura Asphalt Paint."

DAYTON STEEL FOUNDRY COMPANY, Dayton, Ohio, has issued an illustrated folder devoted to a description of its improved Model 10 Dayton dual pneumatic steel wheel.

MURRAY CORPORATION OF AMERICA, INC., Detroit, Mich., has issued an attractive illustrated booklet devoted to a description of its bus coach work.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has added to its loose-leaf advertising folders the following sheets: "Constant-Speed Direct Current Motors, Type CD"; "Type GTE Motors for Gearless Traction Elevators"; "Low-Speed Synchronous Motors, Types TS and QS"; "Hand Starting Compensators, CR1034-K17-K21 and K22"; "Type WD-300A Arc Welder"; "Low-Speed Direct Current Generators"; "Atomic Hydrogen Arc Welding Equipment"; and to its loose-leaf advertising sheets "Automatic Supervisory Equipment Selector Type"; "CR4409 Protective Panels"; "CR7006-D26 Magnetic Switch," and "Improved Brush-Holders for GE-70 and GE-80 Railway Motors." It is also sending out loose-leaf pamphlet entitled D. & W. oil fuse cutouts type D.

The Engineer in the Rôle of Prophet

DEAN HERMAN SCHNEIDER of the College of Engineering and Commerce of the University of Cincinnati has prepared a prophesy which has been placed in the cornerstone of the new Union Central Life Insurance Building in Cincinnati, dedicated on Jan. 16. He would be the last to claim infallibility as a prophet, the most difficult of rôles. He knows, of course, that whatever wealth of progress science may bring out of its bag of tricks, man 100 years hence will not be different from us fundamentally, any more than we are different from mankind of 5,000 years ago in our passions, our vanities, our personal ambitions, and all other inherent human elements of which our spirits are compounded. But he is led to the belief that during the next hundred years science, religion, philosophy and even enlightened selfishness will walk together with greater surety toward the destiny for which mankind has been groping and blundering down the ages.

Just such prophesies are needed ever so often for the stimulation they contain. Ever since man became a reasoning animal fanciful, indeed, has been the first conception of the oddity that later has become reality. The whole gamut of history might be run to prove the point, but it is only necessary to mention Fulton, Edison, Bell, Marconi, Ford, Eads and Westinghouse to bring to mind the names of a myriad of other men whose first efforts were met with the smile of derision often from contemporaries of the pioneer. Many there are who always see things through a glass darkly. To them there is no remedy for the ills by which they are oppressed. They often have great fortitude, but very little foresight. And they have small patience with the advocates of change. They forget that progress should be imputed very largely to the builders of Castles in Spain, and that "Without Vision the People Perish."

Chicago's Anti-Parking Ordinance Benefits the Public

MUCH has been said in recent years about the evils and injustice of automobile parking in busy city streets. But though the facts are recognized, there has been practically no relief. The authorities in too many of our large cities have been afraid to offend someone, and congested business streets are still used by automobile owners for the free storage of their cars.

But in one city, at least, a change has come. Chicago is showing the way. Since Jan. 10 all parking has been prohibited in its central business area between 7 a.m. and 6:30 p.m. on Mondays to Fridays inclusive, and between 7 a.m. and 3 p.m. on Saturdays. The results to date are told by E. J. McIlraith in an article in this issue.

Most interest perhaps will be felt in the effect on the number of customers and the sales in the retail stores within the district. It is from the owners of such stores that most of the opposition to non-parking ordinances in the past has come. The experience in Chicago is that there has been no appreciable effect from the ordinance. This result might have been predicated from a previous analysis that only about 1½ per cent of the patrons of these stores came in automobiles. But it is satisfactory to have direct testimony on this point of effect on sales and patrons.

It is still more encouraging to learn of the gains in increased usefulness of the streets. Vehicles are moving with a saving in time of more than 20 per cent during the evening rush hours and of more than 30 per cent in the business day before 4:30 p.m. Street car schedules are much more regular. Pedestrians move more freely and with a greater sense of security. All these benefits have been obtained, of course, without limiting the use of the street to traffic in any way. Taxicabs, buses, private cars and commercial cars are permitted to operate as before. Passenger vehicles can stop to receive and discharge passengers as they always have done. It is simply that they cannot block the streets by using them for storage purposes.

The Chicago example should be followed by other cities.

Tacoma Pays the Penalty of Its Badgering Policy

RECEIVERSHIP for the Tacoma Railway & Power Company appears to be inevitable. This is a situation especially to be deplored, since mistaken political policies have had a good deal to do with forcing the company to the wall. For some years the conditions under which the company was required to operate were very bad, particularly during the term of office of the late Mayor Fawcett, who, in gloating over his anti-corporation attitude, inflicted the jitney upon the company. More recently, under Mayor Tennant the situation has been bettered, but the change appears to have come too late. As the present Mayor sees it, a prompt and orderly solution of the railway situation appears to be at hand. He has not been more specific than this, but his attitude toward the matter, and his attendance in New York at the meeting at which the affairs of the company were considered by its security holders would appear to augur well for the future.

The vociferous oppositionist appears, however, not to be stilled, since S. A. Perkins, newspaper owner, has just declared that if Tacoma had acquired its railways fifteen years ago "even paying five times the price they were worth, the city would be twice the size it is today." As he pretends to see it conflict at the City Hall with the railway would have been avoided.

Here, of course, is one of those half truths more deadly than the truth itself. In the first place, the statement about the probable growth of the city is clearly imaginative. Neither Mr. Perkins nor anybody else is in a position to say definitely what would have happened. But even granting that he is correct, could not Tacoma with

Digitized by Google

results far more lasting to itself have achieved the same end under a program which would have made it possible for the company to carry on as it desired? As for the benefits of the avoidance of conflict, they would have been unmistakable. But they could have been obtained under private ownership.

Certainly, municipal ownership would not have helped here, not even at the City Hall. If there is any system that has been in the public eye more than the municipally owned one in Seattle, ELECTRIC RAILWAY JOURNAL does not know about it. It has been a case of continual conflict there. If wise, Tacoma will keep the situation in Seattle constantly in mind, and then proceed to effect a settlement of its railway problems in a business-like way that will take into account the drafting of an agreement for operation which will be sufficiently liberal in its terms to permit the present management to carry on as it is qualified to carry on. Hard hit as it is, the Tacoma road can be successfully rehabilitated, but only if the ideas on the part of the representatives of the public who deal with the company are so revised as to discard practically all of the motives that have actuated municipal administration there in recent years.

Adequate Fares Essential to Service Improvement

LIKE straws in the wind, there come these days from every quarter of the country, news dispatches regarding the upward adjustment of local transportation fares. Houston and Atlanta recently joined the rapidly growing list of cities in which a ten-cent base fare for a street car ride has been established. Dallas, Baltimore, and several other communities are making a move in the same direction.

Supplementing this trend toward equitable car fares, there is a similar undercurrent of thought in favor of putting bus fares on a basis which will permit this newest public transportation agency to stand on its own feet financially. To do that, buses must collect a rate of fare commensurate with the cost of giving supplementary transportation service, which in many instances is of a character distinctly different from that given with cars.

It is now generally agreed that the rate of fare in many initial bus applications was set too low. As a consequence the general idea was permitted to grow in the public mind that a bus ride and a street car ride can be given at approximately the same fare levels. There is no need here to review all of the causes for this situation. Suffice it to say that in some instances over-enthusiasm and an ambition on the part of some bus men to replace street cars, led to many initial installations at rates of fare that were too low to permit the development of bus service on an economically sound basis. In other instances buses replaced jitneys that consisted of nondescript small touring cars run by irresponsible operators and charging rates of fare below the cost of operation of a responsible, organized transportation service. The railway had the choice between operating buses at rates comparable with those charged by the jitneys, or of sitting back and permitting these "mosquito fleets," operating only on lines representing the cream of traffic, to sap the revenues of the street railways to the point where the entire transportation service was in danger of collapse. In still other instances, there existed the threat of competition by private bus operators. Self-preservation dictated the acceptance of almost any fare arrangement which would permit the street railway to make a move toward co-ordinating the rail and rubber tire transportation services.

Many cities are now awakening to the fact that the car riders of the community are paying for bus losses attributable to inadequate rates of fare for bus riders. This situation is receiving serious consideration in those cities that have had sufficient experience with the operation of buses on a large scale to get a fair approximation of the actual operating results. As a consequence the idea that bus operation should stand on its own feet financially seems to be spreading. It is obvious that this new form of public transportation cannot be developed to its logical place in the scheme of public services, unless it is permitted to become a financial asset and not a liability.

There are several outstanding examples of operations which, while originally started at street car rates, are gradually moving toward higher fare levels. As the number and length of bus lines is increased it is important that the 10-cent upper limit for city bus fares be broken before it becomes too firmly fixed in the public mind. At present there are lines in several cities giving a preferred class of service and charging a 25-cent fare. When the intermediate range of 15- and 20-cent rates is generally applied for all services which cannot be carried within the 10-cent limit, bus development will have burst one of its present restrictions and may be expected to move forward more rapidly than ever.

In the operation of both cars and buses, therefore, common sense economics and a clearer understanding of fundamentals are leading toward the establishment of fares that promise widened opportunity for really merchandising public transportation service. As the rates of fare are brought to levels that offer fair opportunity for reasonable profit railway managements may be expected to attack with increased zest and determination the many problems incident to providing really satisfactory public transportation service.

What Makes the Street Car Slow?

WITH the railroad station about a mile away, a business man had fifteen minutes to catch a train. He wavered between taking a taxicab and taking the street car. From past experience he knew that the taxi usually made the trip in five minutes and the street car in seven. He felt that he had sufficient time, so he decided to take the car and save the difference in cost.

But he hadn't allowed for the attitude of the management of that particular street railway. The company was more interested in getting his nickel than in giving him his money's worth for it. He boarded the car and paid his fare. Then he noticed that the conductor was having trouble with the fare box. In front of one of the company's depots the car stopped and an inspector got on. Conductor and inspector examined the fare box and discussed the situation. The car did not move. At the conclusion of an apparently complicated bookkeeping operation, the inspector removed the defective box and disappeared into the building. Still the car did not move. The passengers fretted and fumed. Presently the inspector reappeared with another fare box, which he installed in its appointed place on the platform. Another complicated bookkeeping operation ensued. Finally the car moved on.

Seven minutes had been lost by this procedure. The

Digitized by Google

car was late now. At every corner more passengers boarded the car, making it later than ever. Instead of the usual seven minutes to reach the railroad station, the trip took seventeen. The hurried business man reached the train shed just in time to see the attendant taking down the sign which had marked the train he missed. He had lost his train and the street railway had lost a patron forever.

Reasons there are, of course, for practices of this kind. The passenger's nickel is the life-blood of the railway. Revenue must be protected and all that. But in the last analysis the best way to protect the revenue is to render service that satisfies the customer.

New York Company No Longer the Silent Victim

QUITE within its rights is the Interborough Rapid Transit Company in its appeal to the Transit Commission for a 7-cent fare and in its statement indicating its purpose to carry the matter to the courts. This is not the first time that the company has sought similar relief, although on the previous occasions it took no steps other than its appeal to the commission. They were lost first by changes in administration and second by changes in which the Legislature played battledore and shuttlecock with fare control provisions.

The flood of comment that has followed the company's announcement made it appear that the change in rate might be made over night. Nothing, of course, is farther from the fact. Despite this, however, journalistic advocates without number recommend further temporizing. Even the New York *Times* says that both sides have far more to gain through patient dealing with each other than through blasts and counter blasts, lawsuits and counter law suits. This would be good advice if the recommendation had not already been nullified by the course of the city under the Hylan administration, by the inaction of the present city administration under Mayor Walker and by the still more recent belligerent attitude of the Transit Commission under the procedure of its counsel whose every move seems to be a threat.

The record of fare increases on electric railways elsewhere throughout the country testifies to the widespread recognition of changed economic conditions. Even the public directors of the company who voted in the negative on the issue are convinced that satisfactory service is impossible without an increase in fare. The position of the company is that it does not desire to charge more or less than the rate of fare which will conservatively enable it to pay proper wages and meet present-day operating costs, together with an adequate return upon the property devoted to the public service. This is essential that its credit may be restored and that it may procure new capital sufficient for improvements. In short, it seeks neither more nor less than a reasonable fare, based on elements recognized by the courts and subject to revision downward or upward as the costs and conditions justify. In this respect the Interborough is modesty itself when contrasted with most of its critics.

Summarized, the plea made by the company to the Transit Commission is that the rate regulatory provisions of the law entered by implication into the terms of the leases, agreements and authorizations covering the subway and elevated rapid transit railroads; that they formed part of the obligations of those instruments, and that they were notice to the parties thereto that those instruments were coupled with a provision that the Legislature, in the exercise of its powers, either itself or acting through another might regulate the rates thus fixed, and particularly, with the provision of the statute that a common carrier, such as the Interborough, was allowed by law to put into operation a new schedule of just and reasonable rates and charges to be made for service, upon notice, filing and publication, as provided by law.

In its legal phases the matter is not so easy to follow. The company has equipped and is operating under contract calling for a 5-cent fare certain lines that the city built. In the event that the case goes to the courts from the commission the railway will put in a plea of confiscation. It is safe to say that most of the critics of the company would long since have resorted to the course upon which the company now enters had they been confronted with a set of conditions similar to those with which the Interborough has had to contend. In matters of this kind it makes a great difference whether one is a spectator of them or one of the victims.

Progress of Simplified Practice Continues

GROWTH of simplified practice as a means of eliminating waste in industry has continued during the year. This is indicated by the completion of eighteen new recommendations, thus bringing the total number of projects to 80, according to a review of the past year's activities of the Commercial Standards Group of the United States Bureau of Standards by Ray M. Hudson, assistant director in charge.

This paper has from the outset been in favor of the simplified practice movement, since it has been shown that it effects economies and facilitates the work of maintenance. That simplification yields benefits sufficient to attract manufacturers, distributors and consumers alike is indicated by the high degree of adherence shown by reviews of fifteen of the simplified practice recommendations already promulgated. According to the report acceptors representing an average of nearly 83 per cent of the total volume of the industries affected are following the simplified practice schedules. Associations indorsing the recommendations grew from 686 to 898 during the year while individual concerns went up from 2,775 to 6,676. This means that an increasing number of industrial purchasers are specifying simplified lines when buying because they find that such items usually are more readily obtained, their quality is better, and prices are lower.

Mr. Hudson cites many specific instances where simplified practice has made savings. The money value ranges from small sums up to many thousands of dollars. Not the least of the savings reported are due to the smaller stocks that need be kept on hand and the greater ease of handling the stocks.

In the transportation industry, the simplification program still can be carried much further than it has been so far. Many properties have found that the number of stock parts can be reduced greatly without detriment to the finished work and with all the advantages cited above. The program should continue to receive attention of those involved and every effort should be made to carry it as far as practicable. The savings to each company are so great that they cannot be overlooked by anyone who has a regard for keeping costs down.

Chicago Prohibits Parking

in Its Central Area

Before adoption of present ordinance a few individuals hampered free movement of many thousands. Under new law, vehicle speeds have gained from 15 to 30 per cent and usefulness of the streets has been greatly increased

By E. J. McIlraith
Staff Engineer Chicago Surface Lines

PARKING in Chicago's central business district is banned by an ordinance that became effective Jan. 10. That it will be continued seems certain. Various measures will be applied to determine the success of the change, and some variety of opinion will result. People differ widely in opinion on the value of each of our best assets. There will even be a variety of opinion about the beauties and gladness of heaven. Opinions of individuals are not always well established by adequate and relevant facts.

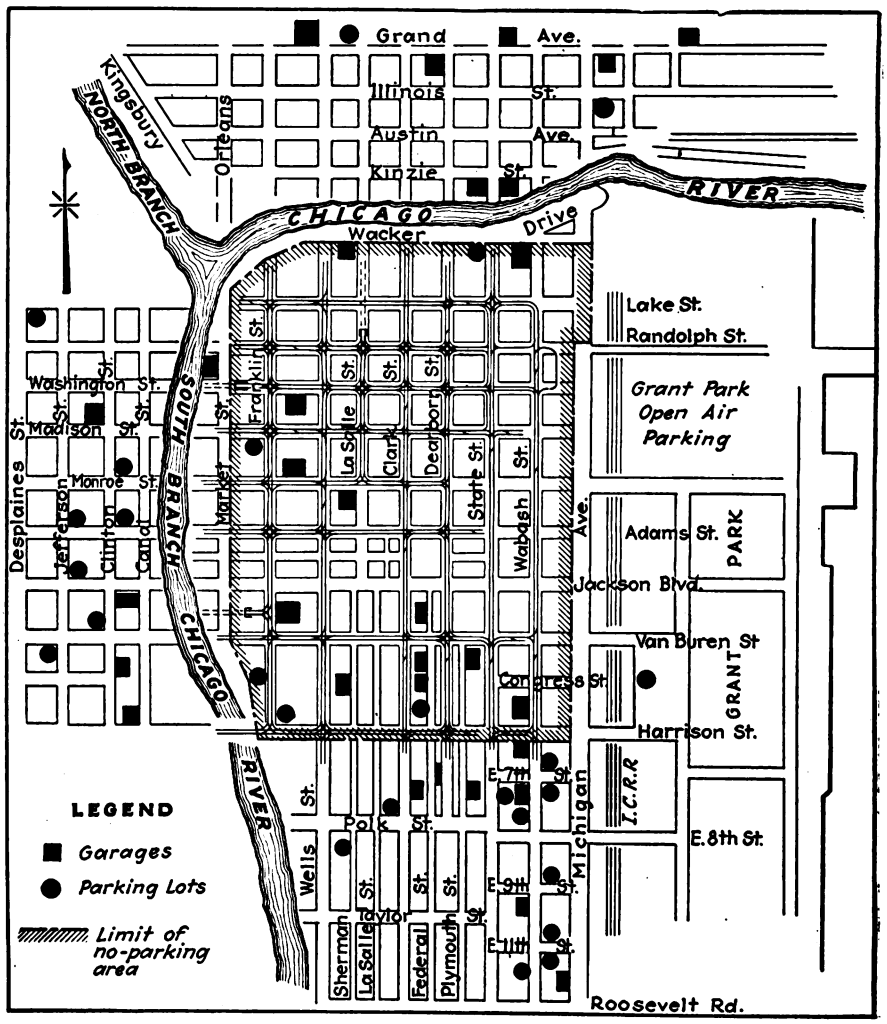
The primary purpose of the regulation is to permit the growth and development of Chicago. It is to encourage the concentration in Chicago of the administrative, financial, advisory and engineering organizations and of great mercantile and sales corporations that are finding this city the most desirable strategic location from which to direct the business of the great area which is coming to be tributary to Chicago.

The growing central district in Chicago is fast changing to a concentrated group of huge office buildings built about streets that were laid out for a frontier town. The usefulness of those streets constantly must be kept adequate to serve conveniently the needs of the great army of 900,000 people who now daily move into the district and travel about within that area.

Unless it is apparent that regulations can be made from time to time that relieve materially the threatened congestion and prevent the occurrence of confusion on the city streets, confidence cannot exist in the future of this area that soon promises to be more valuable than that of any similar area in any city. Without such confidence the rapid surge forward of the last five years will be checked and finally stopped.

The present enthusiasm to locate in Chicago, and the urge for magnificent new buildings closely arranged, convenient to each other, are dictated by sound economic reasoning. Great building activity will continue if the application of modern principles of city development can be expected from Chicago's city government so as to keep pace with such concentration of building activity.

On Manhattan Island two major business centers exist,



The central business district of Chicago, showing the no-parking area and the location of garages and parking spaces

Under the present ordinance parking is prohibited in the area inside of the shaded line between 7 a.m. and 6:30 p.m. from Monday to Friday inclusive and from 7 a.m. to 3 p.m. on Saturdays.

Wacker Drive, with its two levels, adds parking space for 1,700 cars. Parking space on streets could serve only 1,157 cars at one time.

Digitized by Google

because lack of street space and lack of adequate transportation threatened to throttle business in the lower end of the island. The difficulties and tendencies on Manhattan are not at all present in Chicago, where the land values are becoming higher than in New York, and where the original central area of the city is still the most valuable. There is ample opportunity for the development of a sufficient number of streets and adequate lines of convenient transportation to serve the great central area of Chicago for the next fifty years.

TABLE I—COMPARISON OF PEDESTRIAN COUNTS IN DISTRICT, MADE BEFORE AND AFTER PLAN WAS EFFECTIVE

STATE STREET, BETWEEN MADISON AND MONROE, 11:30 A.M. TO 6 P.M.

	West Side of Street			East Side of Street			Total Both Sides
	N. B.	S. B.	Total	N. B.	S. B.	Total	
Nov. 25, 1925	30,000	30,375	60,375	18,856	16,400	35,256	95,631
Jan. 23, 1928	35,115	37,764	72,879	27,602	23,546	51,148	124,027
Per cent increase	17.0	24.2	20.8	46.4	43.6	45.1	29.7

CLARK STREET, BETWEEN MADISON AND WASHINGTON, 12:45 P.M. TO 6 P.M.

	West Side of Street			East Side of Street			Total Both Sides
	N. B.	S. B.	Total	N. B.	S. B.	Total	
Dec. 15, 1925	7,475	7,150	14,625	9,175	9,356	18,531	33,156

Per cent increase	52.6	52.1	52.3	11.0	9.2*	1.3	23.8

* Indicates Southbound decrease.

Three major steps in recent years have steadily produced increased street capacity and improved convenience for all the people using the streets. In 1924 rerouting of street cars and abolition of left turns of vehicles over a large area made a remarkable street improvement. In 1926 an entirely new, and as yet the best, system of signal control again added new capacity and increased the convenience and safety of the streets. Now in 1928 another great step has been made, and again a new confidence has been established that there are always new ways to prevent confusion and congestion.

The next major improvements that can be made are already clear and will be effective in due time before the results from the present expedients have been absorbed by the growth in street traffic. Chicago has been leading all large cities in avoiding excessive congestion in its principal center.

Exact figures to express the degree of improvement as a result of the no-parking regulation can be obtained only as a result of compilations of data on many factors. Such data as are now available measure decided improvements. Vehicles are moving with a saving of time averaging more than 20 per cent in the rush period of the evening and more than 30 per cent in the business day before 4:30 in the afternoon. Street cars are averaging speeds that save 15 per cent of their passengers' time. Better than the time saving is the improved regularity with which the street cars move through the streets. This means more uniform spacing for the cars along the entire length of each line. All parts of the city served by lines entering the loop area are bound to get better service.

Pedestrians are moving more freely and with a greater sense of safety. There is better vision for drivers and pedestrians, less confusion and crowding, fewer conflicts and dangers.

Merchandise vehicles can move with freedom and can easily reach the curb for loading and unloading. Taxicabs no longer need to collect passengers or stop to unload and receive fares on crosswalks or in a line of moving traffic. There is freedom on practically all streets at all times. Where points of difficulty still remain it is only because some necessary regulation of movements has not yet been made or further signal adjustment is needed to meet the changed traffic flow.

The effect on the volume of shopping, banking and restaurant business is, of course, important. It is early to have reliable figures. It may have been unfortunate that this regulation became effective at one of the dull periods of the winter season. It is a quieter year in business than a year ago, and the second week of January is a period of lull after the readjustment period that begins after Christmas when big reduced price sales are advertised that attract many shoppers.

The most convincing data to date are comparisons of pedestrian counts. All counts were made on days having seasonable weather, but those taken previously were made during very active business periods. Even though January is normally quieter than November and December the number of pedestrians counted on the streets, after this ordinance became effective, was tremendously greater than at a period about two years previously when business was considered excellent. The present January depression may have decreased the purchasing power of the individuals, but it is apparent that a greater number of individuals are available on the streets as potential customers.

Interesting figures are those of store-door counts which have been taken at those stores whose representatives were loudest in condemnation of the plan. These checks show conclusively that there is no difference in the number of customers beyond that to be expected as a variation from day to day.

TABLE II—ONE-DAY COUNTS OF CUSTOMERS IN REPRESENTATIVE SHOPS IN DISTRICT, MADE BEFORE AND AFTER PLAN WAS EFFECTIVE

Establishment	Before	After
Furs and apparel	371	357
Book store	2,008	2,018
Restaurant and bake shop	3,307	3,218

There can be, however, no appreciable change at once due to this new regulation. Over a period the effect must be to the advantage of all.

SMALL MINORITY DELAYED MOVEMENT OF MANY

Parking has been a decided and major factor in creating street congestion. Most of the streets are either 48 ft. wide or 38 ft. wide between curbs. With 8 ft. used on either side for parking on 48-ft. streets only two-thirds of the original width was left for movement while on the narrower streets only one lane was available in each direction. Since the curb lane was occupied by parked vehicles much loading and unloading of merchandise and passengers was carried on from vehicles standing alongside the parked vehicles. Further, the maneuvering of vehicles into and out of cramped parking spaces delayed all movements along the street.

Out of 892,000 people entering the Loop per day only 27,000 or 3 per cent were using parking space at the curb, whether in prohibited areas, or at illegal time, or correctly, as noted by actual counts taken between 10 a.m. and 6 p.m.

Only 1,157 vehicles can park legally at any one time in the Loop District and since 1922 parking has been prohibited by ordinance between 7 and 10 a.m. and between 4 and 6 p.m. on all streets having car lines, although the ordinance is not well enforced. Parking has

Digitized by Google

On Monroe Street before and after the parking ban

The view at the left was taken looking west on Monroe at Dearborn on Jan. 6, 1928, at 11:37 a.m. The one at the right was taken from the same location on Jan. 10 at 11:47 a.m.

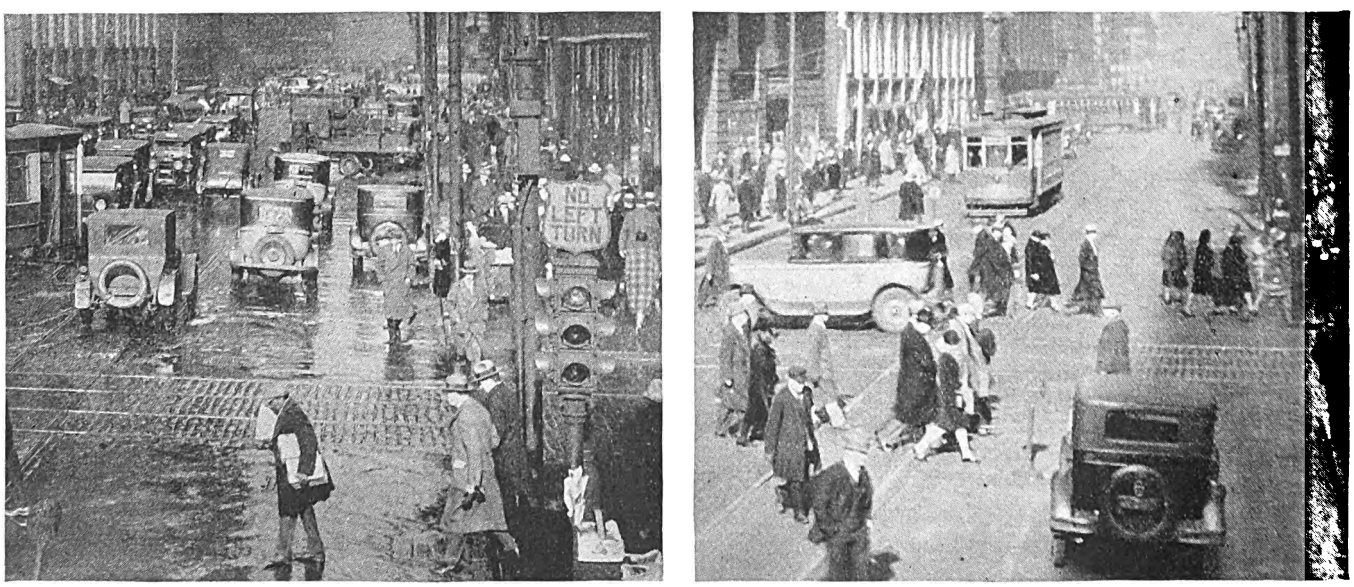
also been prohibited on Jackson and on the west side of Michigan Avenue. The maximum number of vehicles that legally could use the available space in one day, under the limitation of one-half hour, would be 18,222. Counts show that only 78 per cent of the vehicles parking have been private automobiles, so the number of these which could have parked under the old regulations would have been 14,213.

Only 17 per cent of all the automobiles driven into the district could be given parking space at the curb, the other 83 per cent of drivers found ways of using automobiles without standing on the public streets. Does it not seem reasonable that the 17 per cent should be required to do likewise when their vehicles are so seriously in the way and create congestion for the other 97 per cent of street users?

On State Street between 2 p.m. and 3 p.m. of a typical day 22,676 people were counted walking on both sides of the street between Monroe and Madison. For the same hour in August a count showed that with all the parking space used in the block and with more than 90 per cent of the vehicles private automobiles only 122 people were served by parking. In other words out of the 22,676 people on the sidewalk only 122 came from parked cars that occupied a space 8 ft. wide along each curb.

On Clark Street between Washington and Madison in the same hour 8,259 people were walking the sidewalks while only 94 people were served by the parking space, although it was all in use. Can such use be justified in a busy district?

Not all blocks had so much parking space available as the two above mentioned under the restrictions in force before Jan. 10. Out of a total curb length in the loop of 57,958 ft. only 17,352 ft. was left for parking under the ordinances previously in effect. More was being used and the large number of cab stands were equivalent to parking in using curb space. But many business houses had obtained "no parking" zones in front of their buildings—the alderman for the district has had 144 ordinances passed creating such restrictions. Yet, in spite of this constant reduction in available parking space due to individual action of the business men some now feel that clearing the streets of the rest of the parking is a serious hurt to business. It is fear rather than reasoning that prompts the notion.



Views on Dearborn Street in the heart of Chicago's Loop district

The views are looking north on Dearborn Street at Adams. The one at the left was taken on Jan. 6, 1928, at 12 noon. The one at the right was taken on Jan. 10 at 11:40 a.m.

Digitized by Google

The abuse of the parking privilege was always great, since it was impossible to keep a record on the time vehicles arrived and left. Table III shows the results of an unofficial count of vehicles in the central section, where curb parking was limited to a half-hour period.

TABLE III—TIME THAT VEHICLES USED PARKING SPACE IN CONGESTED DISTRICT BETWEEN 10 A.M. AND 6 P.M.

(The total number checked was 19,447. Of this number 78 per cent were private automobiles.)

Time Parked	Number of Cars
Less than 40 minutes	16,066
Between 40 minutes and 60 minutes	1,364
Between 1 hour and 2 hours	1,208
Between 2 hours and 3 hours	348
Between 3 hours and 4 hours	171
Between 4 hours and 5 hours	116
Between 5 hours and 6 hours	58
Between 6 hours and 7 hours	56
Between 7 hours and 8 hours	60
Total number observed	19,447

Of those automobiles which parked more than 40 minutes, 86 per cent were private cars. In other words, the selfish user was saving himself 50 cents or less for garage space, was leaving his car exposed to the weather and to the hazard of bumps and scratches, and was causing the other citizens a wastage equal to many dollars, due to his misuse of the most valuable space in the city.

Interviews with 96,082 people showed the proportions using curb parking space were as shown in Table IV.

TABLE IV—SHOWING NUMBER OF PATRONS INTERVIEWED AND NUMBER ARRIVING IN PARKED AUTOMOBILES

Establishments	Total Patrons Interviewed	Those Arriving by Automobiles Parked at Curb Number	Per Cent of Total
Department stores	68,621	1,013	1.47
Office building	9,432	167	1.77
Banks	8,421	144	1.71
Musical instrument stores	2,649	61	2.29
Furniture stores	2,378	45	1.88
Shoe stores	1,064	32	3.02
Restaurants	2,405	41	1.69
Book stores	112	2	1.74
Grand total	96,082	1,505	1.57

As will be seen, only 1.57 per cent arrived in automobiles that parked at the curb. Can any merchant measure the effect of these few when his daily variation of business is much greater?

There is garage space available for all who wish to park within or immediately adjacent to the Loop. Even if each person who used curb space were to put his car in a garage in this immediate vicinity there would be a considerable amount of vacant space left, and more garages are being built.

The streets in this area seem to have lost much vehicular traffic. They look rather like a former holiday. Yet, counts of the vehicles now operating in the mid-winter period as compared to summer conditions, do not indicate any material change in the total number. There are almost as many private automobiles as ever in spite of the decreased use that is made of automobiles in cold weather. Many more can be operated because of the increased street freedom that has been created.

TABLE V—CHECK OF MOVING VEHICLES ON FOUR REPRESENTATIVE STREETS OF CENTRAL DISTRICT, MADE BEFORE AND AFTER PLAN WAS EFFECTIVE

	Street Cars	Private Autos	Service Autos	Taxi-cabs	Wagons	Tota
July and August, 1926	*2,399	13,882	3,523	9,814	858	28,077
Jan. 30-31, 1928	.....	13,150	4,007	10,930	764	28,851
Per cent increase	.....	—5.3	+13.7	+11.4	—10.9	+2.8

* One of these streets has no car tracks.

Automobile owners have not been hurt, but automobile usefulness has been improved and the comfort of driving much increased. Street capacity has been much increased. Costs of and delays in the delivery of merchandise have been greatly cut. Street car passengers can get to and from safety zones with much greater comfort and can get better car service at better speed.

Pedestrians have much better visibility, more room to move and better safety.

Business cannot be hurt noticeably, even if the most pessimistic view were taken. Indeed, in all cases it must soon show real improvement because the central district is a better place for all who come there.

The prestige and promise of future greatness of the entire city of Chicago is enormously promoted by this step toward preserving freedom and convenience of communication in the central business district. This deserved reputation for constructive adjustment to meet growing needs will create real confidence that this city can continue to grow until it is the greatest in the country, and the most convenient one in which to do business.

Index Numbers of Electric Railway Construction Costs

The relative costs of track construction by years is analyzed. Greater productivity per hour of track labor found

DEVELOPMENT of index numbers of public utility construction costs, with particular reference to electric railway track costs, is discussed in an article which appears in the November issue of the *Journal of Land and Public Utility Economics*. It is by Paul Jerome Raver, valuation engineer. He points out that the street railway industry lends itself particularly well to the making of such index numbers, because the construction side of the industry has been fairly well stabilized for a number of years. But he warns that too much should not be expected of any index number.

TABLE I—RELATIVE PRICES OF TRACK MATERIALS

Contract Prices, Delivered to Yard—1913=100 Per Cent

Classification	1913	1916	1919	1922	1925	1926
Rail—high tee and girder	100.0	121.8†	169.5†	154.4	147.9	147.9
Rail—low tee	100.0	107.7	157.3	132.6	141.5	140.4
Fish plates	100.0	114.5	270.0	187.8	258.9	258.9
Tie rods	100.0	137.1	200.0	130.3	144.2	148.8
Tie plates	100.0	114.6	133.6	79.2	105.9	93.7
Special rail fastenings	100.0	182.5	259.3	187.5	205.3	205.3
Hook-head spikes	100.0	146.9	226.3	156.2	181.2	181.2
Ties	100.0	111.8	195.1†	186.3	209.9	216.6
Torpedo sand	100.0	85.5	113.6	146.9	136.4	136.4
Crushed stone	100.0	92.4	130.4	244.6	188.0	179.3
Portland cement	100.0	121.0	190.0	194.0	205.0	195.0
Granite paving blocks	100.0	102.9	120.1	159.3	164.2	164.2
Vitrified brick, paving	100.0	124.7†	171.1†	174.9	147.3	143.5
Creosoted wood blocks	100.0	107.3	169.3	152.0	165.3	168.3
Hauling excavated material*	100.0	129.2	230.8	430.8	476.9	476.9

* Yearly contract. † None purchased; market price used.

In the present study approximately 95 per cent of the total revenue track on streets was considered a fair sample, and the various types of track construction were taken in approximately the same proportion. Of the total sample, 93 per cent is paved and concreted construction. The principal paving material is granite block, with creosoted block, brick and concrete making up the balance in varying proportions.

Overhead charges were excluded because they are usually applied as a percentage of the total valuation after this had been determined. Some minor items were

Digitized by Google

also excluded as affecting only the fifth significant figure of the index number. These small items also, it is believed, will produce errors which are compensating rather than cumulative. The hauling of excavated material was included under material rather than under labor, as it is usually handled by contract. Some other items were excluded, because their installation has been confined to a relatively short and recent period. Steel ties are an example.

The relative prices from 1913 to 1926 inclusive of

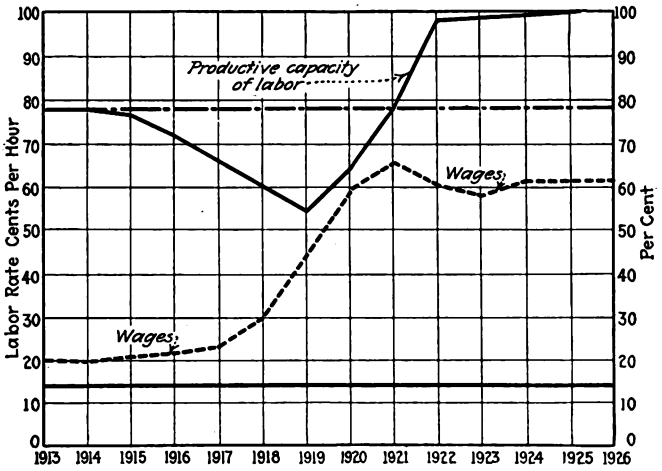


Chart 1—Variation in labor-hours per mile of single track, 1913-1926 (1926 = 100 per cent)

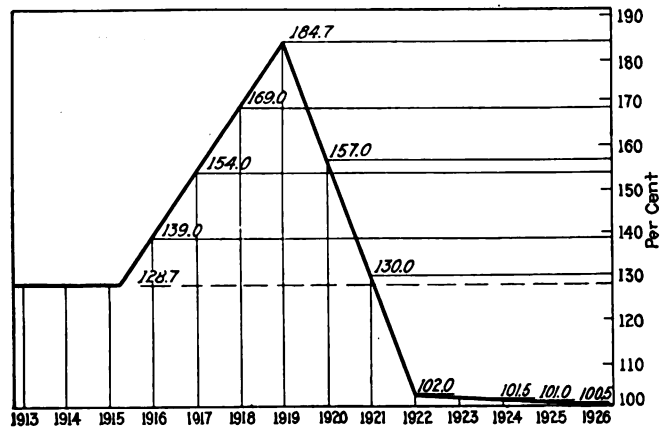

Chart 2—Productive capacity of track labor (1926 = 100 per cent) and labor rate in cents per hours, 1913-1926

the fifteen principal items used in track construction are given in Mr. Raver's article. A portion of the table is reproduced in Table I. The value of each item in the total track structure and in the composite index number of track material for the same years, is also published. These figures are reproduced in Table II. The author says the weights given by him to the different factors apply during the period mentioned and will continue to do so for many years to come, unless companies undertake an extensive reconstruction or extension program.

In his compilation contract prices were used, except in a few cases where they were not available. In these instances the relative market prices were used to interpolate the contract prices. Savings from cash discounts were not considered. The cost was that laid down in the company's store yard. The cost of hauling the material to the job was included in the labor hours analysis.

Factor of Labor Productivity

To determine the variation in productivity of labor, a heavy type of paved track construction, typical for the group of companies studied, was analyzed. The variation of the number of labor hours required from 1913 to 1926 to build 1 mile of single track of this type of construction, was charted on a percentage basis and is given in chart 1. The year 1926 was taken as 100 per cent because in it the productivity of track labor was found to be greater than in any other year in the series. Though based on one type of track construction only, the percentage variations shown on Chart 1 have been assumed to apply to each of the different types considered in determining the total number of labor hours. From these figures the productive capacity of labor, shown on Chart 2, was obtained, the chart also showing the average wage rate.

From these figures the aggregate labor cost of the total track sample is obtained, as shown in Table III. As will be seen in this table wages are approximately 205 per cent higher than they were in 1913, but labor costs only 138 per cent higher.

TABLE III—TRACK LABOR, 1913-1926—AGGREGATE LABOR COST OF TOTAL TRACK SAMPLE

Based on: (1) Aggregate labor-hours in 1926 taken as constant for each year (37,584,601).
(2) Productive capacity of labor with 1926 taken as 100 per cent (column 6).

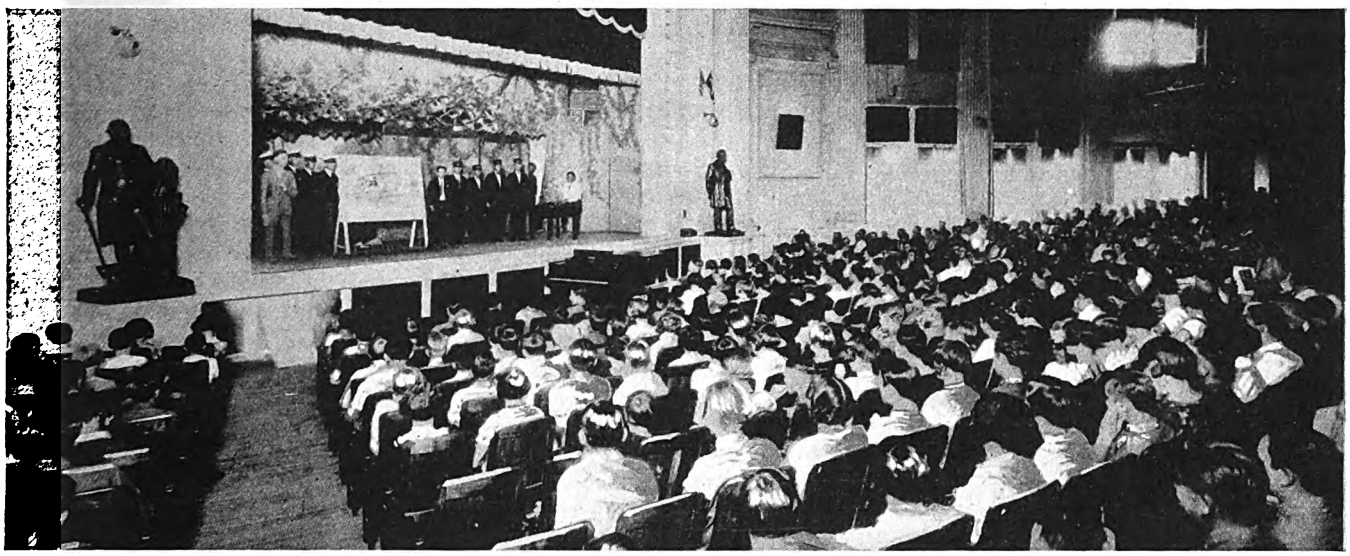
El Paso Wins Prize for

Precautions Against Accidents

This medium-sized electric railway has developed many excellent practices which brought for it the Brady award in its class



A safety chalk talk to new pupils of the El Paso High School. The captain of the police traffic squad did the talking and a representative of the El Paso Electric Company did the chalking

SAFETY practices of the El Paso Electric Company, which received the Brady 1927 prize for safety offered to medium-sized electric railway companies, show what an electric railway operating between 1,000,000 and 5,000,000 car-miles a year can do. The company furnishes co-ordinated electric railway and bus transportation service to a combined population of 137,000 in El Paso, Tex., the government cavalry post at Fort Bliss, and Juarez, Mexico. It owns 43.03 miles of equivalent single track and does an annual business of approximately $850,000. Its rolling stock consists of 76 passenger cars, six work cars and four buses.

In 1926 there were 452 accidents, as compared with 546 in 1925, which is an improvement of approximately 17 per cent. Compared with 1921, the accident figures for 1926 indicated an improvement of 74.4 per cent. In bringing about this reduction, the company has co-operated with the police traffic department, the public schools, civic, engineering and social clubs, the Chamber of Commerce, parents and various other agencies. One of these was the Forum public safety committee, which succeeded in staging a number of safety shows and demonstrations during the year.

Besides all the more commonly known methods, a number of original ideas have been put into force. Outstanding among these are the "honor roll," "safety star system," "bogey breakfasts" and "seven zero days" contest.

One of the earliest organizations in the city with which cordial co-operation in safety measures were established was the police force. The traffic officers and other members of this organization hold regular meetings twice monthly. Frequently, now, the operating officials of the El Paso Electric Company are invited to meet with them and discuss traffic problems and accident prevention. In the arrangement of car stops and parking zones for automobiles the advice of the company is always sought by the department, and often it is possible to make valuable suggestions. The company supplies the department with accident data.

Co-operation with the daily papers is intimate. The El Paso *Herald,* for instance, during 1926 published short biographies of each of the company's gold star safety men with a portrait. One of these sketches appeared every day during the year until the list of gold star men was exhausted. The company supplies the daily papers in El Paso with any information about operation which it is thought will be of interest to the public. Thus a great deal of safety news appears in type.

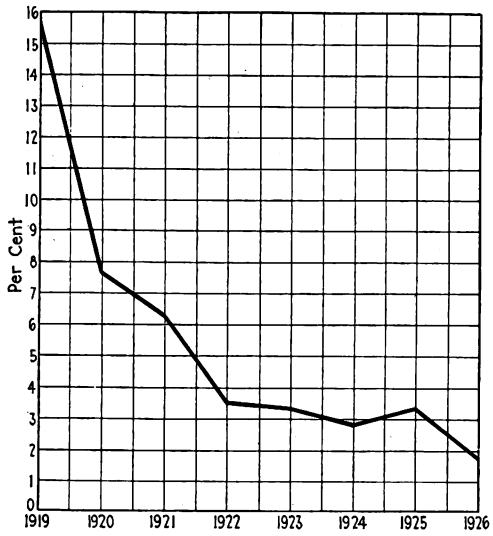
The company has also co-operated with various civic clubs, has furnished them many motion picture films dealing with electrical subjects, and on a number of occasions representatives of the company have been invited to address the meetings of these clubs.

Close co-operation has been effected with the public schools. Films have been loaned to them, safety calendars have been supplied and during the year students in all high schools in Texas were called upon to submit safety art posters in a state-wide contest. Upon request, the company furnished to one of the art teachers, for

Digitized by Google

help in this contest, a set of safety slogans which had been run on the dashboards of the street cars.

As already explained, the public safety committee of the Forum planned and executed many novel safety demonstrations during the year. The manager of the company was chairman of this committee, and a number of company employees were active in the work. A week was set aside, known as "Anti-Speeding Week." The committee concentrated its efforts on the discouragement of careless and reckless speeding of automobiles through the crowded city streets. A street car, equipped with numerous safety signs and slogans, which characterized speeding as pure selfishness, was operated about the city. During another week, as part of the program of the same committee, a huge safety demonstration was staged in one of the largest municipal parks. The demonstration dealt with various phases of public accidents, such as street car accidents and those likely to occur to persons playing around live wires. On this occasion the



The percentage of gross earnings spent for accidents and claims has shown a rapid descent in the last seven years

proné pressure method of resuscitation and other methods of first-aid treatment were demonstrated by the employees of the company.

Another activity of the Forum committee during the year was the staging at Liberty Hall of a giant safety spectacle. It was in five episodes, dealing with different accident hazards to pedestrians and those confronting school children during vacation periods. The episode dealing with street car hazards was handled by company employees by means of a safety court scene, in which the police traffic squad co-operated. Offenders charged with violation of the safety code, most commonly the cause of accidents in which street cars become involved, were properly dealt with by a stern but just judge. This skit, which was written by employees of the company, was cleverly presented and made a deep impression upon the large crowd that witnessed the performance.

A monthly safety parade, in which many local merchants and industrial concerns entered novel and striking floats, was another important activity of the public safety committee during the year. The company entry was called "The Book of Safety." This giant book contained pages measuring 4x6 ft., so arranged that the leaves could be turned. Left-hand pages contained safety messages, such as "Believe Me, It Hurts to Get Hurt." The pages opposite each message were left blank, but during the progress of the parade a company investigator, who is also an excellent cartoonist, drew pictures illustrating these messages. They made a big hit. A picture of the company's float, with a story about the big parade, appeared in the *National Safety Magazine*.

Department of Investigation Does More Than Settle Claims

The company's claim department is known as the department of investigation. It has been made a part of the transportation department, and the relation between it and other divisions of the transportation deparment is one of the most splendid co-operation.

When a man enters the employ of the company, the superintendent of the department of investigation has a friendly talk with him, in which he outlines the company's interest in accident prevention and assures the new employee of every assistance in his work. If at any time an operator displays signs of carelessness, his case is given particular attention by the department. Frank and confidential chats are had with him and the cause is usually determined and eliminated.

The superintendent of the department takes frequent trips over the system during which he talks to operators regarding various phases of the accident situation and encourages them to greater effort and vigilance in the practice of safety.

Whenever children are found playing near the car tracks, stealing rides or in any way molesting the company's service or equipment, their names are obtained and a letter is sent to their parents. Frequently, personal calls are made upon the parents, who are warned of the danger of such practices and are told that the chief interest of the company is to protect the youngster from possible harm and to promote greater safety.

Changes for Safety in Equipment

The company has done much in the way of changing its track and car equipment in the interest of safety. In one instance it moved its track from the side of the street to the center, to allow the street to be widened and reduce the accident hazard. It has equipped all cars with automatic safety doors, marked with the word "Stop," so that it can be seen when the door is opened, to warn approaching vehicles. It has put "Watch Your Step" signs on all cars, has equipped every important street intersection and all dangerous crossings on the system with signs reading "Slow Down—Car Line" and has placed warning signs on both ends of all double truck equipment, reading "Please Do Not Try to Pass This Car on Curve." It has provided an oak wood wheel block for the use of each car on a line that terminates on a rather steep grade near the High School to be used while the operator is changing ends. Other changes have been made in the equipment where they have seemed reasonable to promote safety.

In operation, cars on all the lines are required to stay at least a block apart in all parts of the city, except in the downtown section or on sidings and at important junction points. This has eliminated car bumps.

Signs on Buses Too

An equal amount of thought has been given to the safety equipment of buses. Large attractive stop lights have been installed on the rear of all buses with the word "Stop" on the lens in white letters on a red field. A sign that reads "Toot Your Horn and This Bus Will Gladly Move Over" has been painted across the rear end

Digitized by Google

of all buses, both in interurban and city service. All buses have been equipped with awnings, which shade the rear seats, making riding more comfortable. They are installed at an angle so as not to interfere in any way with the operator's vision or proper use of his rear view mirror.

Rearrangement and enlargement of the shops and carhouse during the year enabled a number of added safety precautions as well as fire precautions to be made. Warning signs in English and Spanish have been placed on all high-voltage machinery. The electric welding machines have guards and signs, cautioning workmen and others not to look directly at the arc. All shop machinery and equipment is inspected regularly, and every possible precaution taken to provide safe working conditions.

Trolley Breaks Reduced

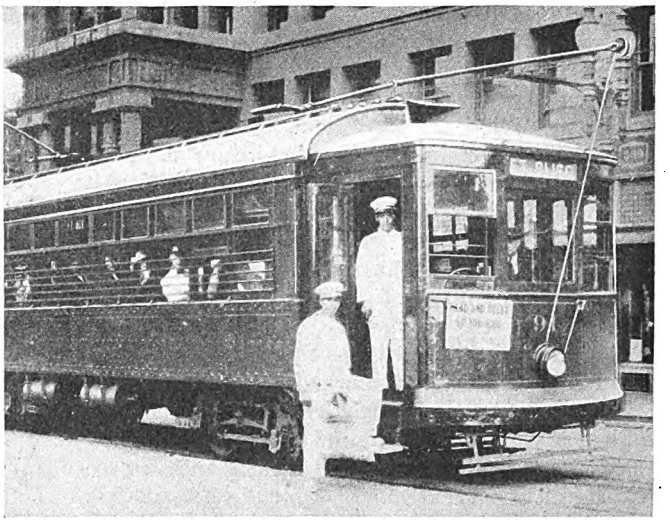
In El Paso, the hot days in summer, followed by cool nights, make maintenance of trolley wires a serious problem on account of the extreme expansion and contraction. This situation has been met by frequent and thorough inspections. The system has been divided into twelve sections, one of which is worked over during each 30-day period. In this way the entire system is gone over every year. This enables the company to keep all overhead trolley wire in excellent condition at all times. Phono-electric wire is installed on all heavy-duty curves.

By the various means described, trolley breaks have been reduced from 239 during 1921 to 21 during 1926.

Better Maintenance of Equipment

The efforts of the company, especially in recent years, toward greater efficiency in maintenance and inspection were not prompted entirely by a desire for greater safety; yet they are found to have an important influence on it. All cars are subjected to a thorough inspection every night. These inspections cover brakes, controllers, trolleys and all wearing parts. In addition to this daily inspection, cars have a general inspection after running from 1,500 to 2,000 miles, depending on the type of equipment. This schedule means that each car has a general inspection every ten or twelve days. Motors are overhauled after each 50,000 miles run.

An ingenious improvement has been made in the engineer's valve, which is the old Type M-28. A small hole $\frac{7}{32}$ in. in diameter was the only brake service position of this valve. It was easy for the operator to push the brake handle past this hole into a lap position, through which no air passed. When this was done rapidly, it frequently happened that the valve handle passed the brake service position to the door open position, creating an accident hazard.



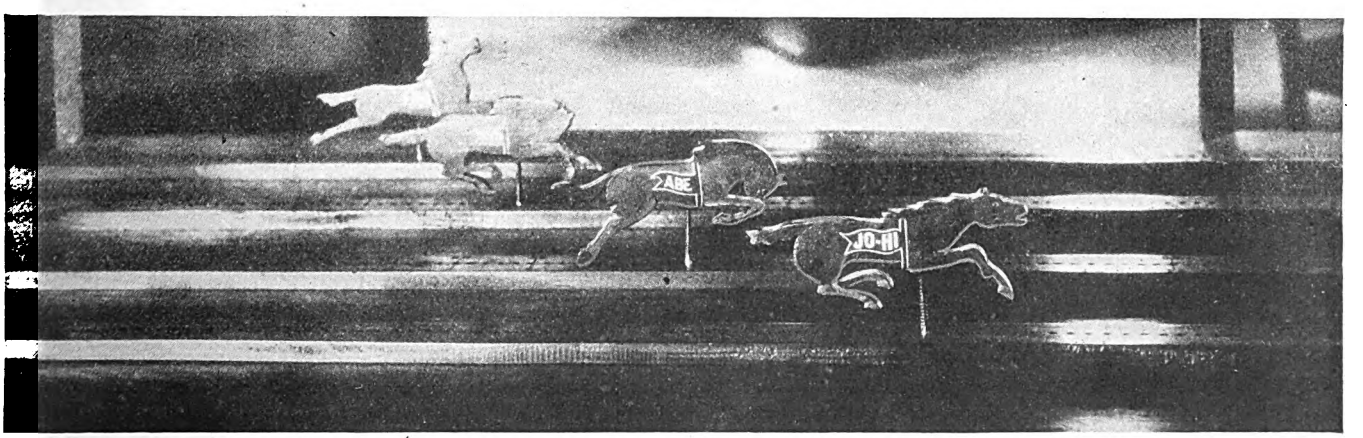
Employees in white uniform sweep out the cars at convenient junction points

The master mechanic of the company perfected an improvement in the valve, which eliminated this difficulty. A second hole of $\frac{5}{32}$ in. diameter, was drilled $\frac{3}{8}$ in. from the original brake service position, and the two were connected by a slot. This changed the old lap, or "handle off," position and made it possible to obtain air all the way between the two positions. The value of this improvement was so obvious that the manufacturers adopted it as standard. The advantage from a safety standpoint is that it eliminates the danger of safety doors being opened before cars come to a full stop, thus avoiding accidents from this cause.

A rule has been passed limiting the speed of cars on all switches and around curves to 4 m.p.h., and it has been found possible to arrange the schedules so that this rule can be followed without any sacrifice of schedule speed between termini. The result has been to prevent many derailments and split switches.

Honor and Bonus System

To maintain the interest of the operators in safety, they are kept fully advised regarding the accident situation at all times. The method used to do this, besides being simple in conception and execution, has proved to be most effective.



Keen competition for the best safety record is maintained among the different divisions. The progress of each during the month is recorded on a miniature racetrack

Digitized by Google

A record is posted on the bulletin board daily, giving a list of all street car and bus accidents that occurred on the previous day. A chart is posted to show the number of accident and no-accident days by months over a six-year period.

Each operator has assigned to him a special card for recording chargeable accidents, with blank spaces for listing the various kinds of accidents. They hang in a case inclosed in glass, a separate hook being provided for each card. After an accident is recorded on such a card it is transferred to a similar case marked "accidents this month." Then, if it is found to be a chargeable accident, it is placed in a third case similar in design to the two others, but marked "charged accidents this month." All chargeable accidents are marked on the card in such a way as to distinguish them from other occurrences, and these cards supply at a glance a record and history of the accidents of every trainman.

Each month an honor roll is compiled and posted, containing the names of all those who have worked during the previous month without having been charged with an accident. After a trainman has been on the honor roll for three consecutive months he has a day off with full pay. For each consecutive month thereafter that he remains on the honor roll he has an additional day off with pay. Whenever he is charged with an accident he has to start all over again.

In addition to being placed on the honor roll, a trainman who has completed twelve consecutive months of operation without an accident is given a gold star. Individual stars are given for each year up to and including three. Operators wear these stars upon the sleeves of their uniform coats. Operators who complete four years without an accident receive a large star with a numeral in the center to indicate the number of years they operated without an accident. This system, known as the honor roll system, has been in effect for seven years and at present 70 per cent of all the trainmen of the company are gold star operators.

Several "no accident" day contests have also been conducted. In the last one six consecutive days was the record. The trainmen have taken a great interest in these contests.

To provide a realistic representation of the progress of the contest, a miniature racetrack has been arranged, with a wooden horse and rider to represent each division. Each day that a division has no accidents the corresponding horse is moved forward five notches. With one accident the horse is moved only four notches; if there are two accidents, only three notches, and so on. At the end of each month the winning division receives a banner, which is held until the race is won by another division. Operators and inspectors of the division winning the banner for two consecutive months are invited to a safety banquet. These banquets receive wide publicity from the local newspapers and help to awaken and keep alive a public safety conscience.

Bogey Breakfasts for the Men

Bogey, or 2 a.m., breakfasts for all trainmen constitute another method of rewarding operators for unusual accomplishments in accident prevention. The best previous month's accident record is set as a bogey. During the four years that this system of reward for safety and operation has been in effect there has been a reduction in the number of street car accidents of approximately 66⅔ per cent.

At the bogey breakfast held on Aug. 16, 1926, about 225 were present, including trainmen and their invited guests. The hour was selected because it was the only one in the 24 when all the men could get together, A great deal of interest and enthusiasm was displayed.

Although these measures to promote safety have been taken in behalf of the general public, equal precautions have been taken to provide proper measures of sanitation and health for the employees and the public. The grounds about the properties belonging to the company have been made attractive by the planting of grass, shrubbery and flowers. The storage yard has the appearance of a pleasant and inviting park, as it has a neat iron fence around it, there is a flagpole in the center, the ties and car wheels are stacked in neat and orderly piles, the litter is removed and all tools and equipment are carefully looked after.

The cars are kept clean on the road by a special "white wing" service stationed at convenient junction points. The members of this staff are dressed in white uniforms and are equipped with brooms, dustpans, dusters and other paraphernalia to keep cars and buses neat and tidy at all times. Their appearance at work is evidence to the public that this important matter receives consideration. All cars and buses are disinfected every night by a solution applied to the seats, woodwork, flooring and hand straps.

Safety kits have been installed in the carhouse, transportation club room, bus garage and power plant. They are regularly inspected and carefully equipped for the protection of employees. All employees receive regular instruction in first-aid work and the prone pressure method of resuscitation, and all of them know what to do in an emergency.

Meeting Motor Truck Competition

By Ray B. Needham
Traffic Manager Bamberger Electric Railroad, Salt Lake City, Utah

LIKE many other interurbans, at one time the Bamberger Electric Railroad, Salt Lake City, Utah, depended almost entirely on its passenger business for revenue and handled very little freight. The increasing passenger traffic was due to frequent service as compared to the long-interval steam railroad service, generally adjusted to fit in with transcontinental schedules. Later, through more frequent freight service the Bamberger line built up a large l.c.l. freight tonnage. Both this business and carload traffic were confined largely to local freight on its own line. Still later through freight rates were established with connecting steam lines, with the result that an attractive interline carload business was developed.

Upon the completion of the concrete highway paralleling the Bamberger Electric Railroad between Salt Lake City and Ogden the auto freight trucks started to compete in the handling of the l.c.l. tonnage, and not only transported the shipments between the two cities at slightly greater rates than the railroad's, but included free drayage at point of origin as well as at destination. As a result the Bamberger Electric saw its l.c.l. tonnage gradually decrease, and it was apparent that the only hope of regaining this business was to put on a pick-up-and-delivery trucking service at terminals so as to compete with the trucks.

Digitized by Google

Two l.c.l. freight trains, at noon and at night, are operated in each direction daily except Saturdays, Sundays and holidays. Upon telephone notification auto trucks call at warehouses and stores in the retail and wholesale districts and shipments picked up in the morning are delivered to the consignee the same day and shipments picked up in the afternoon are delivered to the consignee early the following morning.

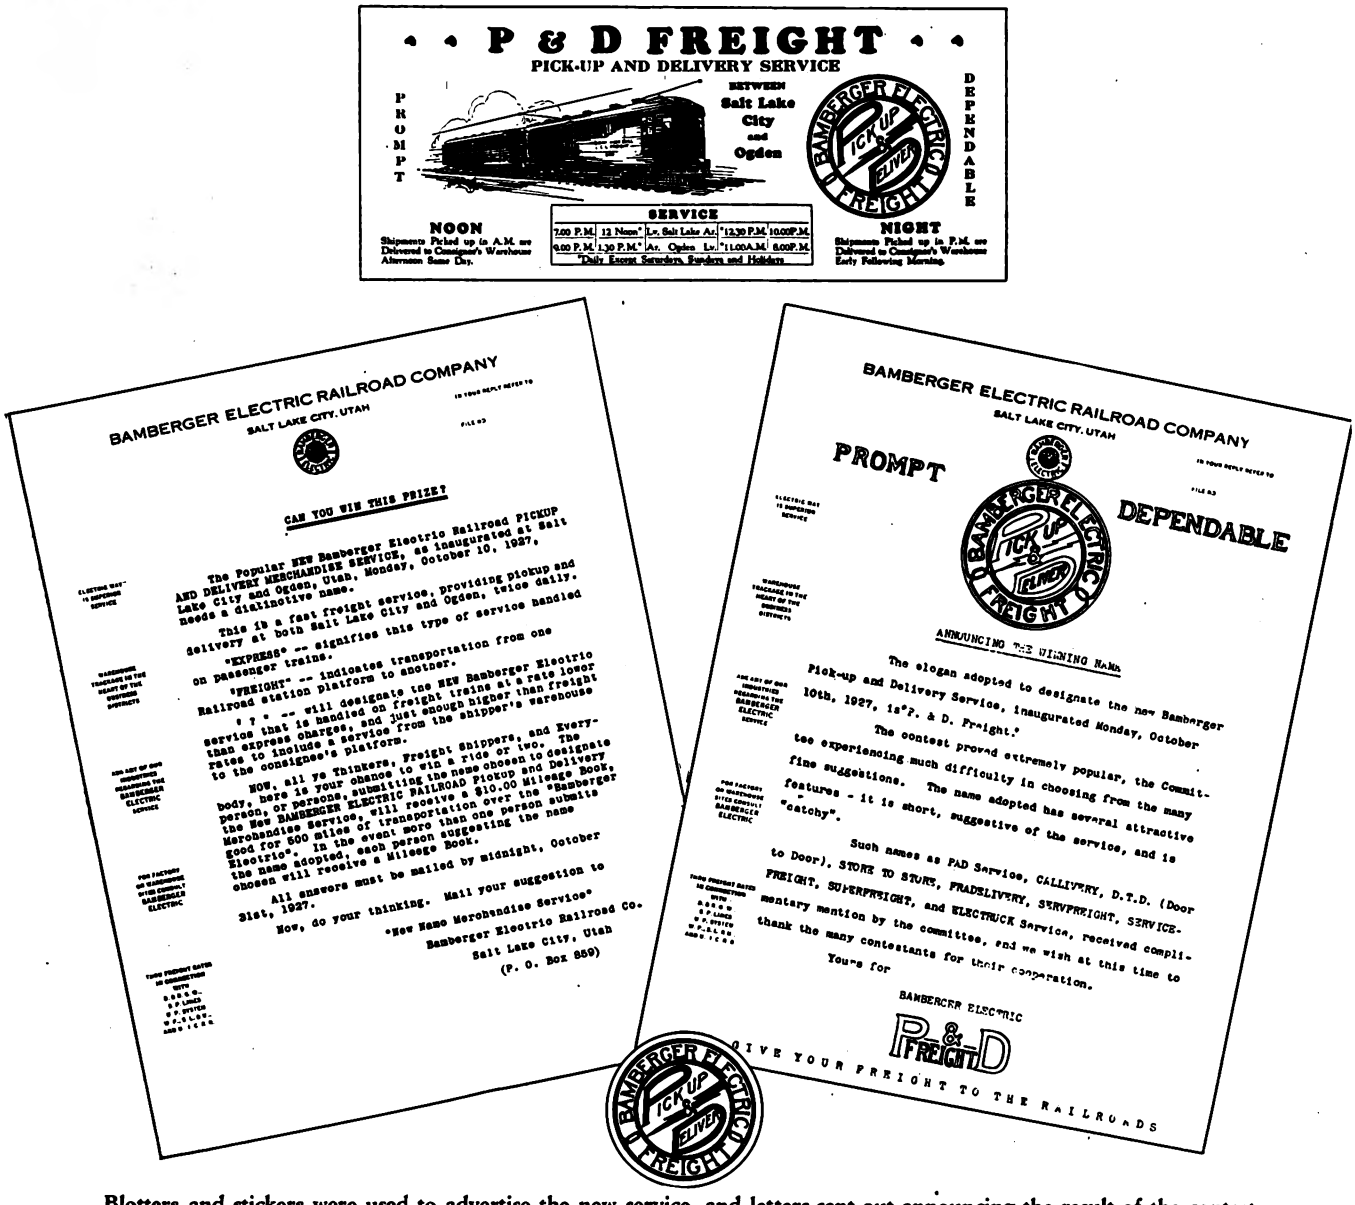
This new service is offered to the public at rates slightly higher than for the regular freight service. As a comparison the rates for the four classes are:

Class	Standard Freight Rate, Cents	P.& D. Rate Cents
1	42½	50
2	35½	40
3	28½	30
4	22½	25

Contest for Naming the Service

After business has been lost it sometimes is difficult to regain, so it was decided the best way to bring this new service before the public was through an advertising New Name Contest. Hundreds of circular letters were mailed to the various shippers and receivers of freight telling them of the contemplated service and asking them to submit a name or slogan to designate it. A prize of a mileage book good for 500 miles of travel on the Bamberger Electric was offered to the person or persons suggesting the name chosen.

The contest proved extremely popular, the committee experiencing much difficulty in choosing from the many fine suggestions. The name adopted was "P. & D. Freight," this being symbolic of the real service. The advertising obtained from this contest could not have been derived in any other way.



Blotters and stickers were used to advertise the new service, and letters sent out announcing the result of the contest which chose a name for the new service

While both pick-up-and-delivery service are provided the delivery feature is the most important. Most shippers have consignments to more than one railroad station, and since they operate their own trucks, they prefer to regulate their own delivery to the various railroads, carrying their l.c.l. freight to the railroad platforms. The result is that frequently the railroad under this new service performs only the delivery and not the pick-up.

The company feels that the new departure is a financial success. Although the net profits at the present time are not large the management expects a larger figure with the increase in freight volume.

Electrical Equipment of Railways in Switzerland

Returns Large Profit

A "balance sheet" has been drafted to show the advantages secured by the electrical equipment of the Swiss trunk line railways. It indicates a cash saving during 1926 of nearly $350,000, besides many indirect gains. By the end of 1928 it is expected that 60 per cent of the track of the Swiss Government Railway System will be electrically equipped. On this 60 per cent of the track, 80 per cent of the business of the railways is done

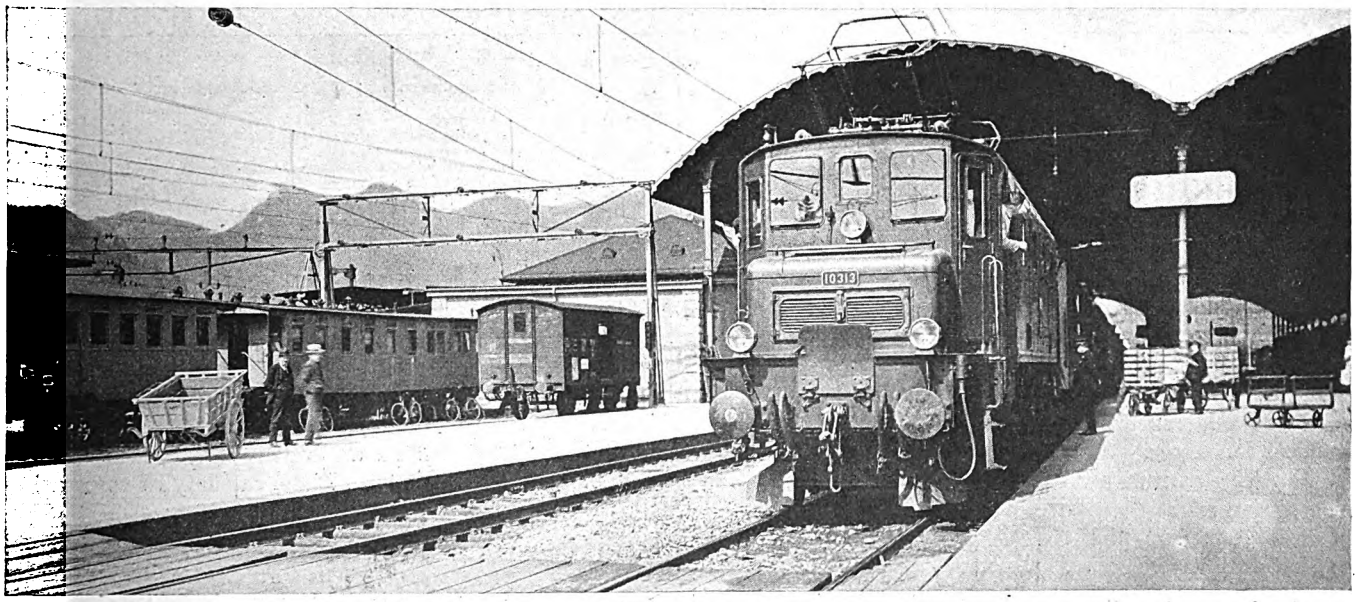
SWITZERLAND is an ideal country for electrical development. It has water power aplenty. Coal is expensive and the many grades on its railway lines make the use of electric power by them particularly desirable because the power which can be applied to a train is practically unlimited. Finally, absence of smoke makes electric operation much more agreeable to passengers, particularly through the many long tunnels which are traversed by the Swiss railway lines.

It is not surprising, therefore, that the Swiss government has been very active in electrical equipment of its railways. During the war, although Switzerland was not one of the belligerents, there was a temporary stoppage in construction because of the delay and difficulty of securing material, especially copper. By the end of 1919, 67 miles of route had been equipped. This has been rapidly increased during recent years. By the end of 1921 there were 136 miles; by the end of 1923, 317 miles; by the end of 1925, 531 miles, and by the end of 1926, 660 miles. Some interesting particulars of this equipment and the financial results obtained are given in the last *Review* published by the Swiss Federal Railways. From it the information following has been compiled:

It was expected that by the end of 1927 the length of route equipped would be 930 miles and by the end of 1928 there would be 1,040 miles of route, with more than 2,275 miles of track equipped with electric power. This mileage corresponds to about 60 per cent of the system and will comprise lines which carry about 80 per cent of the total traffic. These mileage figures are, of course, exclusive of the electrically operated interurban lines under private ownership in Switzerland. With these included, the figures at the close of 1928 are expected to be approximately 2,060 miles of route and 3,280 miles of track.

Power to operate the government railway system is developed for the most part from high-head water-power, acting against impulse turbines. Some of the water has to be passed through mountains, and altogether about 15 miles of tunnels for this purpose have been constructed. The flumes comprise about 6 miles of steel conduit, having a weight exceeding 9,000 tons, while the installed capacity of the impulse turbines themselves reaches about 300,000 hp. In the oil transformers at the

Digitized by Google



Electric train at Olten, a junction point on the direct line between Basel and Luzern

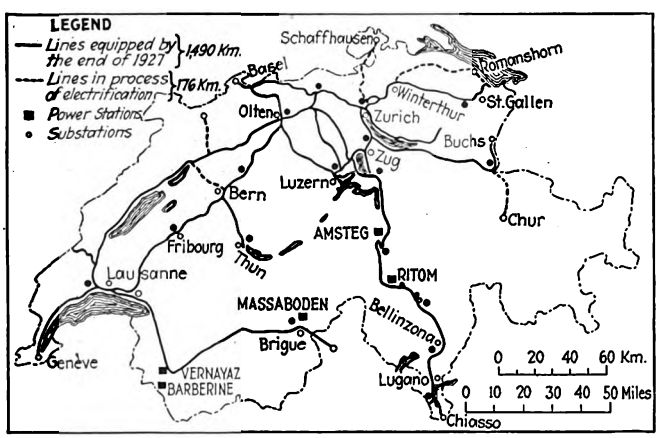
substations there is more than 1,200,000 lb. of oil. The trolley wire represents 3,800 tons of copper, which is suspended from 4,000 tons of catenary cables. The latter are hung on 200,000 insulators, weighing about 11 lb. each.

Despite the tremendous investment which this electrical equipment represents, official reports of the Federal Railway Department show that the financial results secured have been satisfactory. Statistics have been compiled to give what would have been the expense of operating the system by steam as formerly, as compared with electricity. The figures for 1927 indicate that with electric power the cost during 1927 has been at least 1,750,000 Swiss francs ($350,000) cheaper than if steam had been retained. The Director-General of the Department has tabulated the data in the form of what might be called a balance sheet, with debits on one side and credits on the other. It is reproduced herewith to show the saving for the year 1927 of 1,750,000 fr., mentioned above. In this table and elsewhere in this article the francs quoted are Swiss francs, which are worth about 19.3 cents each, or approximately five to the American dollar.

On the Debit Side

On the debit side of this balance sheet the first and most important item is the interest on capital. The investment is estimated at 525,000,000,000 fr. Of this amount, however, 35,000,000 fr. can be deducted because it was received from the government as a subsidy for speeding up the work, so that the charge actually to the department does not exceed 490,000,000 fr. The interest on this sum at 5½ per cent amounts to 26,950,000 fr., or the first item on the debit side.

The second item is the sum of 7,936,000 fr. for depreciation and renewals on the electrical equipment during the year. The third item of 750,000 fr. is for personnel of operation, current maintenance, and energy purchased other than that which would have been required with steam operation. Hence, the total of 38,636,000 fr. is reached as the charges on the debit side of electric railway operation.



Map showing conditions of government railway electrification in Switzerland at the end of 1927

Analysis of Credit Side of Sheet

On the credit side of the sheet the first item is saving in fuel, which is figured for 1927 at 450,000 tons. This coal would have had a value at the frontier, as all coal has to be imported, of 17,100,000 fr. The next item is that of economy in personnel, which is figured at 13,095,000 fr. for 1927. This figure is based on the fact that in 1926 there were 8,616 employees in train service and in the stations, with an eight-hour day, yet the business done was considerably greater than in 1913, when there were 8,886 employees on the payroll with a workday of from 10 to 10½ hours.

It is expected that as electrification is extended further reductions in this item can be made. The saving in manpower comes in various ways. One is that longer trains are hauled. Another is that they come to speed more quickly and make better time, especially on the heavy grades, so that the train crews make longer trips per day than formerly. Then, there has been a great reduction in the force required to make the locomotives ready for their runs and in switching them in the yards.

The third item is saving in locomotive maintenance. Thus, the figures for 1926 show that the maintenance of the electric locomotive averages 30.24 centimes per locomotive-kilometer (9.68 cents per locomotive-mile), although steam locomotive maintenance costs 35.40 centimes per locomotive-kilometer (11.33 cents per locomotive-mile). This is in spite of the fact that the electric locomotive in 1926 hauled an average train load of 293 tons metric, whereas the average for the steam loco-

Digitized by Google

COMPARISON OF ANNUAL EXPENSES AND SAVINGS CAUSED BY RAILWAY ELECTRIFICATION IN SWITZERLAND

DEBIT (Charges due to electrical equipment)	Francs
1. Interest at 5½% on the investment required by the electrical equipment	26,950,000
2. Annual amortization and renewal charges on electrical equipment	7,936,000
3. Extra labor required for electrical equipment	3,750,000
RESULTING SAVING. Electric power is cheaper by	1,715,000
Total	40,351,000

CREDIT (Economies secured by electrical equipment)	Francs
1. Saving in purchase of coal	17,100,000
2. Saving in labor on trains and in stations and yards	13,095,000
3. Saving in maintenance of machinery	4,566,000
4. Saving because the use of electric locomotives has made unnecessary the purchase of additional steam locomotives	4,389,000
5. Other miscellaneous savings (maintenance of track, water, lubrication, haulage and switching of coal cars)	1,201,000
Total	40,351,000

motive was only 210 metric tons. Hence the economy for locomotive maintenance has been put at 4,566,000 fr. in 1927.

Estimates on the saving in other items of equipment, such as track, lubrication, etc., including rent of foreign coal cars, is more complicated. Some of these savings are indirect, as increased output of track gangs in tunnels (of which there are a great number on the Swiss Federal Railways) because the working conditions in the tunnels are very much more favorable than under steam traction. However, a careful consideration of all of these items has brought the conclusion that the saving can be put as 1,201,000 fr.

Last, but not least, is the fact that if the government had not had under way a gradual program of railway electrification it would have been obliged within recent years to purchase a large number of steam locomotives annually. Before the war the number so needed averaged about 30 annually, and there is no doubt that without electrification it would have been necessary during the past ten years to have added at least 200 new locomotives to the system at a cost of at least 50,000,000 fr. This sum would correspond annually, for interest and amortization to 4,389,000 fr.

The figures on the credit side, therefore, amount to 40,351,000 fr., as against 38,636,000 fr. on the debit side, leaving a balance as a saving from electrification of 1,715,000 fr.

In other words, electrical operation shows an actual cash reduction in expenses, besides possessing many other advantages, such as providing much more comfortable transportation and increasing the capacity of tracks as will be discussed later.

It should also be borne in mind that a considerable part of the electrification was carried on during 1918 to 1923, years which unhappily coincided with an era of high prices, so that the cost of the equipment as given on the debit side of the balance sheet actually was from 75,000,000 fr. to 100,000,000 fr. more than if it had been installed at present-day prices. If these had prevailed there would have been a reduction in the annual charges of from 4,100,000 fr. to 5,500,000 fr.

Besides the direct advantages obtained there are many indirect gains, which are impossible of evaluation.

One of these is the improved hygienic conditions and comfort, not alone of the passengers but of the railway employees, and even of the people living close to the right-of-way, from the substitution of electric for steam power.

Another very important advantage, briefly mentioned above, is the increase in the capacity of the tracks.

Electric express train on the Gothard line, near Wassen. This is one of the most interesting sections of the entire line

The extent of this is shown on a typical line, the Gothard, on which in February last, in a single day (Feb. 22, 1927) it was found possible to haul in one direction (north to south) 22,822 tons of freight, although before electrification the maximum freight hauled over this line in any day of 24 hours was 11,453 tons. This was on March 5, 1915.

An interesting point brought out in the conclusion of the article is that of the immense sum of 680,000,000 fr. which will have been invested in the electrical equipment of the railways up to the end of 1928 not more than one-fifth has had to be spent outside the country. In other words, in round figures, 540,000,000 fr. is the amount which by Dec. 31, 1928, will have gone to Swiss manufacturers for equipment and to the labor of piercing the tunnels, building the power stations and carrying on the other work required. At the same time the annual expenditure outside the country of some 20,000,000 fr. for coal for the operation of the railway system has been made unnecessary. In other words, this money was spent within the country, providing employment for its citizens and contributing to its prosperity.

Association Activities

Modernization Programs Hold Delegates at C.E.R.A. Winter Meeting

Interest at Cincinnati meeting keen in proposed improvements in both city and interurban railway facilities in territory. Executives impressed with favorable situation in Cincinnati

"IT IS high time to stop crying over spilled milk and to devote attention instead, to improvement of electric railway facilities, so as to attract that portion of the available passenger business which we are in a position to handle." In these terms Martin Ackerman, retiring president of the Central Electric Railway Association, sounded the keynote of the opening session of the winter meeting held in Cincinnati on Thursday and Friday of last week. Mr. Ackerman pointed approvingly to the Cincinnati Street Railway as among those that have adopted the modernization idea. "Here in Cincinnati there is under way a major rehabilitation program which, while not yet sufficiently advanced to show its full possibilities, has for its object the complete modernization of the property from the ground up," said Mr. Ackerman.

Continuing, he stressed the thought that despite evidences of progress on individual properties there are so many more opportunities for improvement still uncapitalized that the industry cannot afford to rest on its oars for a moment. Mr. Ackerman pointed out that there has been little real progress in the development of passenger business on interurban lines of the territory with what he characterized as an extreme lack of co-operation in the arrangement of local and joint time-tables between electric lines.

The old alibi of the automobile is all too often offered as an excuse for inertia and inaction, according to the speaker, who enlarged on the theme that to build electric railway revenues the system concerned must provide service first and then go after the patronage. Speaking especially of the interurbans, he urged a campaign for clean stations, for advertising the stations with electric signs, for the use of lighter, faster cars with quick acceleration, and for the possible use of sleeping, parlor and dining cars on roads which have long through service connections.

Concerning freight business as the possible salvation of many interurban lines Mr. Ackerman explained that while some lines are in a position to do practically an express business, at the present time this service is being sold at freight rates. Concluding, he urged that railway men ride on their own cars in order that first-hand information may be secured regarding the service rendered.

Talking on the street railway situation in Cincinnati, Walter A. Draper, president Cincinnati Street Railway, sketched briefly some of the difficulties which complicated the reorganization of the local company and delayed the inauguration of its progress of rehabilitation which is now well under way. In conclusion he said that in his opinion it didn't matter so much what particular type of franchise a street railway operated under just so the company and the city concerned possessed the determination to work out their problems together in a spirit of mutual understanding.

Accomplishments in Freight Traffic

Tracing the evolution of freight traffic conditions and demands through the past 25 years Frank D. Norveil, general passenger and freight agent of the Union Traction Company, Anderson, Ind., reviewed the accomplishments of that period. He explained how the interurban systems of the central territory in becoming parties to the new tariff, effective Jan. 15, providing through rates to points south of the Ohio River, will find opened a much larger field of service. Speaking of competition from trucks, due in a measure to their giving store-door delivery in many instances, Mr. Norveil suggested meeting it with a "pick-up" and delivery service on the part of the interurban. Pointing out that carload freight traffic represents the cream of all railroad revenues, he urged that electric roads put themselves in shape to accept and handle standard steam railroad equipment; that only by so doing could they expect to build up satisfactory revenues from freight business.

Mayor Murray Seasongood in welcoming the railway men to Cincinnati commended the attitude of the local company's executives and said that the success of the franchise in effect in Cincinnati rested equally with city and company as a joint obligation.

Lucius S. Storrs, managing director American Electric Railway Association, when called upon by President Ackerman for a word, outlined briefly the status of legislation pending in Congress which should concern the electric railway industry and pointed out how essential to the work of the national association was the interest and co-operation of all the railway properties.

One of the high lights of the convention was the short speech made by R. P. Stevens of New York, president of the A.E.R.A., at the banquet on Thursday evening. President Stevens took occasion to explain that the return of the national convention for a third time to Cleveland, Ohio, was decided upon when it was found the facilities for exhibits at Atlantic City could not be completed in time for the railway convention. He prophesied the largest exhibit in the history of the railway industry was in prospect for next fall's gathering.

Judge Baggott of Dayton, Ohio, was the banquet speaker and delivered a humorous address in which legislation, present-day morals, and kindred subjects of current interest were deftly treated.

Nineteen Committees Make Reports

A symposium of the activities of the Central Electric Railway Association was contained in the reports of some nineteen committees. Calling attention to the work already done by the Master Mechanics Association as meriting greater support on the part of the parent organization, George R. Green, retiring president of that group, urged a closer co-operation of member com-

panies in sending representatives to the meetings. The publicity committee's report recommending the employment of an individual to carry the message of the railway industry to civic associations throughout the Central territory was approved. Recommendations of the safety committee included affiliation with the National Safety Council, the organization on each railway property of a definite program of safety work, and the support of legislation for requiring licenses for automobile drivers. The finance committee's report recommending the increase in member dues from $1 to $1.50 per track-mile to take care of necessary increases in the personnel of the association's Indianapolis office was approved, and the corresponding changes in by-laws suggested in the report of the constitution and by-laws committee.

Cincinnati Franchise Explained

Friday's session of the convention was opened with a paper by E. D. Gilman, Director of Public Utilities of the city of Cincinnati, in which details of the franchise provisions under which the Cincinnati Street Railway operates were explained.

"A franchise such as ours demands the closest co-operation on the part of the officials of both the city and the company," Mr. Gilman explained. "With such co-operation and with a careful study of the physical and financial effects which must be harmonized, the citizens of Cincinnati are going to see within the first four years of the franchise a complete change in their transportation service."

Pointing out the difference between practical and impractical programs of advertising E. T. Gundlach, president Gundlach Advertising Company, Chicago, indicated possible tests which might be applied in endeavoring to ascertain the results actually achieved from specific advertising campaigns.

Mr. Rodger Elected President

A business session concluded the work of the convention at which officers for the next year were elected as follows: President, W. S. Rodger, general traffic manager Detroit United Lines, Detroit, Mich.; first vice-president, L. M. Brown, vice-president Interstate Public Service Company, Indianapolis, Ind.; second vice-president, L. G. Tighe, Northern Ohio Power & Light Company, Akron, Ohio. L. E. Earlywine, Indianapolis, Ind., was re-elected secretary-treasurer.

Three new members of the executive committee were elected: T. A. Ferneding, general manager Springfield-Xenia Railway, Dayton, Ohio; J. A. Greenland, general freight and passenger agent Indiana Service Corporation, Fort Wayne, Ind., and F. J. Foote, master mechanic Indianapolis, Columbus & Eastern Traction Company, Springfield, Ohio, and newly-elected president of the Central Electric Railway Master Mechanics Association.

The summer meeting will be held at Cedar Point, Ohio, the latter part of June.

Central Master Mechanics Discuss Modern Service Requirements

Papers dealing with recent developments in electrical railway equipment occupy attention during Cincinnati meeting held on day before Central Electric Railway Association Sessions

PAPERS and discussion dealing with equipment developments designed to meet present-day operating requirements, and street traffic conditions, occupied the attention of the Central Electric Railway Master Mechanic's Association at a meeting held in Cincinnati, Ohio, on Jan. 25. This one-day meeting, immediately preceding the midwinter meeting of the Central Electric Railway Association, included in addition to the presentation and discussion of papers dealing with improved electric railway equipment, a trip of inspection to the new shops of the Cincinnati Street Railway, manufacturing plants in the city, and the plant of the Cincinnati Car Company. During a luncheon meeting at noon, members of the association were guests of the Tool Steel Gear and Pinion Company.

Variable load brakes, double-reduction W-N truck drive using high-speed, spring-mounted motors, and the use of roller bearings on railway cars, were the subjects of papers by J. S. Y. Fralich, Westinghouse Traction Brake Company; W. J. Clardy, Westinghouse Electric & Manufacturing Company, and M. S. Downes, Timken Roller Bearing Company, respectively. During the luncheon meeting, E. H. Arnott of the Central Service Bureau discussed the initial results of the parking prohibition measure in the Chicago Loop district. President George R. Green, general superintendent Chicago, South Bend & Northern Indiana Railway presided.

Braking Problems with Light Cars

"Introduction by electric railways of light weight relatively large capacity cars has brought braking problems not heretofore encountered," said Mr. Fralich. This he attributed to the fact that single truck cars frequently have a light weight that is only half of the total loaded weight, while many double truck cars weighing approximately 30,000 lb. empty, weigh from 45,000 lb. to 50,000 lb. when loaded with passengers. The wide variation between empty and loaded weight makes it impossible to provide suitable braking facilities under variable conditions of loading with the ordinary type of straight air brake equipment.

The speaker cited average brake design standards on electric railway straight-air brake installations to show that under reservoir pressures varying from 50 to 65 lb. per square inch, braking ratios on empty modern light-weight cars vary from 85 per cent to 100 per cent with minimum reservoir pressure, and from 110 per cent to 130 per cent with maximum reservoir pressure. Even with these braking ratios, which the speaker considered higher than necessary for empty car conditions, in some cases stopping distances are excessive when such a car is fully loaded. This was illustrated by a typical example of the conditions which would be found on a light weight car assumed 30,000 lb. empty and having a maximum passenger capacity of 125. Such a car when empty would have a braking ratio of 100 per cent at 50 lb. cylinder pressure, increasing in proportion as the cylinder pressure increased to a maximum of 65 lb. At 65 lb. cylinder pressure the braking ratio for the empty car would be 130 per cent. On the other hand, this car when fully loaded, assuming passengers at 140 lb. each, would have only 63 per cent braking ratio when the cylinder pressure is at its minimum of 50 lb. Thus, it was pointed out, such a car develops a combination of conditions under minimum and maximum cylinder pressures and under empty and fully loaded operation, in which braking ratios and consequently stopping distance vary by as much as two to one.

Variable Load Brake Gives Automatic Adjustment

It was because of this unsatisfactory braking condition that the Westinghouse company developed its variable load brake, according to Mr. Fralich. This device, he explained, constitutes, primarily, an automatically adjusted feed valve that is set for the brake pressure desired to meet the changing weight conditions brought about by variations from empty to full car passenger loads. Lantern slides were shown to illustrate how the adjustments of this regulating device are controlled by the deflection of the springs between the car body and the truck bolster in proportion to the increasing or decreasing passenger loads, the device being automatically locked against all changes in adjustment except when the car doors are open for the interchange of passengers. The speaker called attention to the importance of this refinement in brake equipment, both from the standpoint of safe operation in congested traffic and increased schedule speeds resulting from the possible reduction in stopping time.

Prefacing his description of the W-N type of drive for electric cars, Mr. Clardy declared that changing transportation conditions demand consideration of developments in equipment which will enable electric cars to meet modern operating requirements. "The surface car of the future," he said, "must be an attractive, comfortable vehicle,

Digitized by Google

capable of providing a safe ride at high speeds in a state of quiet enjoyment." Growing traffic congestion and changed transportation standards were held to demand a new type of surface car capable of maintaining high schedule speeds even under dense traffic conditions, and designed to meet present-day standards of safety, speed, comfort, convenience of boarding and alighting, appearance and quietness of operation.

The effect of growing street congestion in slowing down all vehicular speeds has, according to the speaker, directed public attention to the need for relief measures which will naturally result in more definite and scientific regulation of street use. Distribution of rush hour travel over longer periods through the adoption of staggered business and working hours, limitation of heavy trucking operations to the hours after business travel, restriction of parking or its total prohibition in congested districts, regulation of building operations and the storage of building materials to avoid traffic interference, and other proposed measures for the relief of congestion were cited as examples of the trend of public thought toward measures which will open increased opportunity for improved and efficient public transportation service, provided the equipment used is made suitable to take full advantage of the improved traffic conditions which may be expected. An article on the W-N drive appeared in the Jan. 28 issue of ELECTRIC RAILWAY JOURNAL, page 152.

MR. DOWNS GIVES ADVANTAGES OF ROLLER BEARINGS

Mr. Downes, in his paper on railway roller bearings, said that the use of this type of bearing is a question of importance at this time when refinement in engineering and perfection of equipment are dominant thoughts in the minds of progressive railroad men. Furthermore, he explained, the problem of applying anti-friction bearings to all railway service justifies a careful analysis, both from a technical and economic standpoint: first, because it is believed that their use will mean not only a saving of power in regular operation, but also the elimination of hot boxes, and better running conditions generally; second, because they are expected to bring about savings in lubrication, and maintenance expense as well as reduction in the amount of wear and tear to which the rolling stock is subjected; third, because by their use the riding qualities of the cars may be improved so as to give greater comfort to the riding public.

The problem of producing roller bearings that will stand up under the severe service on railway rolling stock has been a very difficult one, according to Mr. Downes. The solution required extensive tests and experiments which often ended in disappointing failure. These failures have ordinarily resulted from one or more of three causes: first, the crushing strains under heavy loads and blows upon the surface of the metals in rotating members and raceways resulted in fatigue and fractures; second, the diagonal twisting and jamming of rollers; and third, the troublesome end thrust which at times may equal 40 per cent of the vertical load.

Extensive use of self-propelled gasoline coaches within the last few years gave considerable impetus to attempts to produce a practical bearing for railway service, the speaker said. Because of the limited power of the gasoline engine, it was necessary to take advantage of every means possible to improve the load characteristics of the car proper, especially with respect to starting and acceleration. Anti-friction bearings were tried as a possible remedy. Their application produced such satisfactory results in improved starting and acceleration, and in fuel economy and general operation, that bearing engineers were encouraged to continue their efforts to produce bearings suitable for all classes of railway service.

Mr. Downes declared that it has now been demonstrated that it is possible to produce roller bearings of sufficient capacity and durability to stand up under the most severe service. He credited railway mechanical engineers for valuable contributions to the development of a successful bearing by showing what the requirements of the service actually were and pointing out the weak spots in bearing design which were to be avoided.

In order to successfully apply roller bearings to the journals of railroad equipment, certain conditions were held to be essential, i.e., the bearing must have a low frictional resistance for all service conditions; it must have a long service life; the design should be such that both vertical and thrust loads or any combination of these loads may be carried by the bearing proper; quick inspection should be possible; the application should be simple in construction and easy to assemble and disassemble; and finally, the bearing should be adjustable. Lantern slides were shown to illustrate how these requirements are met in the case of the bearing developed by the Timken company.

SMOOTHER OPERATION CAN BE EFFECTED WITH ROLLER BEARINGS

In electric car service the advantages of the use of roller bearings were held to be more rapid acceleration, saving in wear and tear on the motors due to the greatly reduced starting resistance, smoother operation during accelerating and braking periods, greater comfort to the passengers and elimination of journal wear and other forms of journal trouble. Mr. Downes said that the application of tapered roller bearings to the armature shafts of electric motors is receiving wide attention. He added that while this application is still more or less in the experimental stage for motors of city and interurban cars, it has been used extensively in the field of general service motors with a high degree of success. The chief advantages claimed from the use of tapered roller bearings on the armature shaft were freedom from lubrication troubles and the practical elimination of wear—thereby reducing maintenance and at the same time preserving a constant air gap in the motor.

Attention was directed to the fact that tapered bearings are used in two types of the light weight electric cars recently developed. Double reduction W-N gear drive trucks are also equipped in the gear box as well as on the journals with tapered roller bearings. The Timken-Detroit experimental car trucks with worm gear drive, use tapered roller bearings on the pinion shaft and on the axles. The extent to which roller bearings will be used on city and interurban cars was held to depend on the economies effected and on the improvement in service that they may make possible.

PRESIDENT GREEN SUMS UP SAVINGS FROM CO-OPERATION

In summing up the work of the Master Mechanic's Association President Green called attention to the importance of savings which are being made for member companies through the co-operative work of mechanical men in the central territory. He emphasized the practical value of the information contained in the papers presented at the meeting, and pointed out the significance of the statements regarding present day transportation equipment requirements in the introduction of Mr. Clardy's paper. In turning over the gavel to F. J. Foote, superintendent of motive power and equipment Indiana, Columbus & Eastern Traction Company, who was elected president for the new year, Mr. Green expressed appreciation of the co-operation given by the several standing committees of the association in making possible the progressive program of work that had been completed during the past year.

Mr. Foote in turn declared that the performance of the association had more than justified the conception of its originators. He emphasized the importance of continuing the established policy of making the business of member companies the primary objective of the association's meetings, and of discouraging entertainment and social activity.

Because of the important part which they play in the work of improving electric railway practices and in the programs of the master mechanics' meetings, a modification was made in the requirements for membership to permit manufacturers' representatives to join the association as associate members at a cost of $1.50 per year. Applications for membership are to be received by mail at the office of Secretary Earlywine in Indianapolis.

A. W. Redderson, superintendent of equipment Indiana Service Corporation, Fort Wayne, Ind., was elected first vice-president and L. E. Earlywine was re-elected secretary-treasurer. Charles Sigler, T. Nicholl, J. W. Osborne and A. J. Challeen were elected members of the executive committee.

The next meeting was tentatively fixed for some time in May, to be held, at the invitation of the General Electric Company, at Erie, Pa.

Southern Equipment Men Discuss Progress Made in Service Improvements

Latest developments in motor drive, hand brakes, relation of mechanical department to claims and other subjects also receive attention of the meeting

BETTER service and a general improvement in the railway industry in the Southern territory last year, with forecasts of even better results during the coming year, were generally indicated during the three day session of the Electric Railway Association of Equipment Men, Southern Properties, held at the Roosevelt Hotel, New Orleans, La., on Jan. 25-27. The association met with the mechanical division of the Sothwestern Public Service Association.

Cincinnati was selected as the next meeting place, the dates being July 25-27. Robert M. O'Brien, superintendent of rolling stock and shops New Orleans Public Service, Inc., was chosen president; A. Taurman, Birmingham Electric Company, vice-president, and L. O. Eiffert, Alabama Power Company, Birmingham, secretary-treasurer.

That the results obtained by member companies since the formation of the association six years ago, have fully justified its organization, appeared to be the general opinion not only of responsible executives who attended the sessions but of the entire membership. It was pointed out that considerable good has been accomplished by the interchange of ideas of the equipment men. Not only has it resulted in increasing efficiency all along the line but it actually has brought about a reduction of maintenance cost.

A. B. Paterson, vice-president New Orleans Public Service, Inc., stated that the organization of this particular association has proved very valuable in this respect. It began at a time when all properties were in a more or less critical condition, due to the after effects of the war, and it has contributed through earnest efforts, to greatly increased efficiency and reduction in the cost of maintenance. This naturally has brought about an improvement in the service to the public which is absolutely essential on account of the competition from automobile travel. As a result very little street car mileage has been abandoned in the South. The industry as a whole has been benefited.

The convention itself was one of the most successful ever held, according to officers of the association. The attendance set a new record for the association, more than 200 registrations having been filed. They included delegates from all the Southern properties and associate members and representatives from other properties and plants in other sections of the country. There was little opportunity for entertainment and the delegates devoted most of the three sessions strictly to business.

The first day of the convention was given over to addresses of welcome by Mayor O'Keefe and President H. B. Flowers of the New Orleans Public Service, Inc., reports of officers and nine prepared papers on subjects of special interest to the industry.

W. H. McAlonev of the Georgia Power Company, Atlanta, president of the Association, in his annual report, among other things, said: "We are continually looking toward the betterment and improvement of rolling equipment; looking toward the comfort and convenience of the riding public, for despite the increasing numbers of private automobiles the majority of the people find it most convenient and comfortable to use the street cars, and they are rapidly learning it is very much more economical.

"The experience even in many of the smaller cities has proved beyond a doubt that there has not yet been devised any form of city transportation that equals cars on rails for handling the greatest numbers in the smallest street space with speed.

"If the tailor makes the man, so it is that the good looking street car holds up the appearance of a city. New Orleans has a right to be proud of her street car system and management. Her record of traveling 200,000 car-miles between car failures is the best in our association and not equalled anywhere on the continent. Besides it is being done more economically."

The first prepared paper was read by R. S. Bull, superintendent of equipment, Pittsburgh Railways, on "Observations and Outstanding features of the 1927 Cleveland convention." Descriptions were given by Mr. Bull of the "Rail Sedan" of the St. Louis Car Company, a Birney safety car of the same manufacturer, the J. G. Brill "1928 model" car, the Cincinnati Car Company's "Atlanta Car," the car exhibited by the Springfield Street Railway, the Joliet car built by the Cummings Car & Coach Company and others. He also told of the five different types of trucks that were exhibited and of the miscellaneous car equipment representing new developments.

George H. Ingles, claim agent Virginia Electric & Power Company, spoke on the "Relation of the Mechanical Department to Claims." He stated that the shopmen can be of real assistance to the claims department by studying the accident reports carefully, inspecting the damaged equipment and reporting immediately. Equipment men also can promote safety, he asserted, by watching for mechanical defects and keeping the equipment in good order. Comfort and good-will of the passengers is a big factor when accidents occur and shopmen are largely responsible for gaining public favor, according to Mr. Ingles.

The latest developments in railway motor drive were treated in a paper by J. K. Stotz, motor engineer department Westinghouse Electric & Manufacturing Company. He discussed fully the truck design, brakes, gear unit and motors of the Brill 1928 model car which is equipped with the W-N double reduction motor drive and Westinghouse 1425 motor. He listed the advantages of the new equipment and gave information concerning operating costs. An article on the double-reduction gear drive with the high-speed spring supported motors appeared in the Jan. 28 issue of the JOURNAL.

In discussing the subject, "Maintenance vs. Repairs," Gus C. Kraus, assistant to superintendent of rolling stock and shops New Orleans Public Service, Inc., outlined the practice of his company in keeping its rolling stock in the best possible condition. Briefly, the practice consists of overhauling car equipment and car bodies on a periodic basis to reduce maintenance costs and equipment failures to a minimum.

"Cost of Maintenance" was the subject of a paper by A. Taurman, superintendent of equipment, way and structures Birmingham Electric Company. He stated that many properties were misinterpreting the standard maintenance account classifications and that difficulty was being experienced in comparing accounts of properties for this reason. Some of the contributing factors for the variation in costs, according to Mr. Taurman, are: Differences in age and type of cars and the condition in which the equipment has been maintained; individual operating conditions on the various properties; extent of supervision and shop facilities; and differing accounting practices.

A detailed description of the car washing machine of the Pittsburgh Railways was given by J. D. Barr, inspection engineer of that company. Mr. Barr related how the machine was developed and explained carefully how to set it up for operation and how to use it. Features of the machine were listed and its applications outlined. The machine was described in the JOURNAL for March 12, 1927.

Two types of hand brakes, the external or clasp type and the internal expanding type, were described by A. D. McWhorter, general superintendent Memphis Street Railway. He related the operating experiences of several roads which have experimented with hand brakes and gave valuable information and data on their operating characteristics. An abstract of this paper will appear in a later issue of the JOURNAL.

W. G. Walker, railway department General Electric Company, told what the manufacturers are doing to facilitate repairs and to reduce the cost of equipment maintenance. Manufacturers aim to supply operators with replacement parts as speedily as possible and assist the equipment men by supplying drawings, diagrams and information needed in the maintenance and operation of equipment.

A paper on "Co-operation Between

Digitized by Google

the Instruction Department and the Rolling Stock and Shops Department" was presented by E. J. Murphy, superintendent of instruction and employment New Orleans Public Service, Inc. Good public relationship is often harmed by poor service which can be blamed on improperly trained and incompetent motormen. Realizing this and appreciating the value of public good will the New Orleans Public Service established a training school. The course of instruction of this school and all details of the equipment and methods used were described in Mr. Murphy's paper. An abstract will appear in a future issue.

President McAloney complimented the authors of the various papers for the thorough and complete manner in which the subjects were handled. He said they were so ably handled that there was little room left for criticism or discussion. The delegates put in a long day Wednesday, being in session from 9 o'clock in the morning until nearly 6 in the afternoon, with only one interruption for luncheon.

Methods of Providing Smoother Service

The second day of the convention was given over entirely to the discussion of questions relating to the progress each company has made in 1927 to provide smoother service for the car riding public and the improvements made necessary to do this. The discussions indicated that the improvements in the industry have been general throughout the southern district. The greatest interest was evinced in all the subjects brought up. Mr. McAloney, the retiring president, declared that the results accomplished last year and improvements contemplated for the coming year clearly indicated the value of these meetings and fully justified the organization of the associations.

More than 150 delegates attended the banquet given at the Tip Top Inn on Thursday night. There were no scheduled speeches and only a limited number of men were called upon to give brief talks. Mr. Paterson was chosen toastmaster and was given a vote of thanks for the admirable manner in which he performed his duties in that capacity. He commented on the splendid attendance and spoke of the good work being accomplished at these get-together meetings for an interchange of ideas between the equipment men of the various properties.

Mr. Flowers after renewing his cordial welcome to the delegates, complimented them on the good work they have done and are still doing. He referred to some of the problems of the street railway companies and pointed out how everything has to be operated on the strict basis of efficiency and economy. He declared that there must be the utmost co-operation between all the departments. In referring to the association of equipment men Mr. Flowers said that the organization has done a great deal toward bringing about this co-operation. He touched upon the acute traffic situation and urged upon them the need of reliable service in order to offset traffic delays on the system, which have been caused by no fault of the operating companies.

Following the election and installation of the new officers, retiring president McAloney was given a rising vote of thanks for the very able manner in which he presided over the sessions at Atlanta and New Orleans. Mr. McAloney made a very versatile presiding officer and kept the delegates in good humor at all times.

Following the adoption of other resolutions of thanks to officers of the New Orleans Public Service, Inc., and others the convention adjourned. Later the delegates made an inspection of the properties of the New Orleans Public Service, Inc.

New Yorkers Study Ways to Speed Up Service

Relief of traffic congestion and faster acceleration and retardation were principal subjects of discussion at mid-winter meeting of New York Electric Railway Association

SPEED was the keynote of the mid-winter meeting of the New York Electric Railway Association held at the Hotel Commodore, New York City, Jan. 31. That "local transportation must keep on the move or die" was the theme of an address at the morning session by Lucius S. Storrs, managing director, American Electric Railway Association. In the absence of Mr. Storrs the address was read by James W. Welsh. An abstract will be published in a future issue. The effect of signal lights on traffic congestion was the subject of animated discussion at the afternoon session. A paper on this subject by Ralph W. Emerson, vice-president and general manager, Cleveland Railway, was presented by L. D. Bale. An abstract will appear in a future issue. High speed traction motors and the importance of proper braking equipment were other subjects discussed.

In the absence of W. G. Gove, president of the association, W. E. Thompson, vice-president, presided at the morning and afternoon sessions. N. W. Storer, consulting railway engineer Westinghouse Electric & Manufacturing Company, presented a paper on the "High Speed Traction Motor," relating the evolution of the present-day motor. He outlined the various problems to be met in designing the high-speed motor and explained why the Westinghouse Company found the use of 300 volts with two motors in series desirable. Mr. Storer listed three advantages of the high-speed motor: The motor weight is carried entirely on the truck frame, removing the motor dead weight from the axle; the motor is so small that a smaller wheel is possible, permitting a lower floor level, and the equipment offers a substantial reduction in weight over the standard single reduction equipment. An abstract of the paper will appear in a future issue.

The car builders' views on the high-speed motor were presented by George L. Kippenberger, vice-president and assistant general manager, St. Louis Car Company. He stated that appearance of cars and luxuriousness of appointments have been given much attention but that the important factors of high speed, smoothness of control, quietness of running and easy carriage should receive consideration also. According to Mr. Kippenberger, the new motors should prove another forward step in modernizing equipment.

The technical discussion of the motors was continued by H. L. Andrews, assistant engineer railway department, General Electric Company. He pointed out the advantages of 600-volt operation over 300-volt with two motors in series, and gave figures to show that there was no saving in weight with the new-type trucks. The paper in abstract form will appear in a later issue of the JOURNAL.

W. H. Sawyer, past president, American Electric Railway Association, commenting on Mr. Storrs' paper, said that any railway man who feels that nothing can be done to improve conditions on his property should get out of the business to make room for a more wide-awake man. The wheels of the electric railway industry will not keep on turning forever of their own accord. We must all get behind and push. Mr. Sawyer also emphasized the necessity for the industry supporting the progressive manufacturers in the development of new equipment.

R. F. Carbutt told how the electric railway in a small town can be made prosperous and successful.

The traffic problem in New York City was the subject of a talk by Hon. Philip D. Hoyt, deputy police commissioner. He pointed out that the primary duty of the police is protection, and that facilitating traffic movement is secondary. K. W. Mackall, engineer, Crouse-Hinds Company, talked on the subject of traffic control, asserting that proper co-ordination of street car and vehicular movement can be attained with correct signals. He also pointed out the advantages of short cycles. Harvey N. Smith, bureau of gas and electricity, Syracuse, N. Y., emphasized the importance of considering the needs of the street railway in designing and installing traffic lights.

"Brakes as they affect schedule speed and accidents," was the subject of the paper presented by E. R. Fitch, district engineer Westinghouse Traction Brake Company. He emphasized the impor-

Digitized by Google

tance of good brake performance in providing satisfactory service and showed how improving the brakes and brake rigging assisted in speeding up schedules. He also stressed the importance of brakes in reducing the accident hazard. An abstract will appear in a future issue.

J. S. McWhirter, superintendent of equipment Third Avenue Railway System, in his paper which was presented by H. L. Bowman, commented on the use of hand brakes as an important means of preventing accidents and mentioned the generating stop as another resource for the motorman. He also described and gave the advantages of using magnetic track brakes.

The final paper on brakes was read by Hugh Savage, superintendent of equipment Brooklyn City Railroad. Two factors over which the brake designer has no control were discussed by Mr. Savage: The variation in rail surface condition and the unstable equilibrium of passengers who are standing or walking in a moving car.

At the banquet, President Gove, who served as toastmaster, announced that this was the most successful meeting in the recent history of the association. More than 100 attended the day sessions, and some 550 were present at the dinner.

The principal speaker at the dinner was Roland B. Woodward, general secretary of the Rochester, N. Y., Chamber of Commerce. He made an appeal for fair treatment for the mass transportation agencies, showing that this utility is essential to modern city life. Mass transportation is a prerequisite to mass production. The industry, he said, has had many burdens imposed on it that are unfair, and which should be removed, since they are in the end borne by the riders. It must be prosperous in order to give good service. This is the only great industry that has been a laggard in its public relations. As a result the public has not been properly informed. There is more conspicuous ignorance about the business than about any other of which he has knowledge. More publicity is needed to secure public support.

Captain Irving O'Hay, U. S. Army, retired, gave an interesting account of his many experiences as a soldier of fortune.

American Association News

American Executive Committee Meets in Cincinnati

SUCCESS of the plan to encourage state and sectional associations to affiliate with the American Electric Railway Association, which was instituted by changes made in the national association's constitution at the last convention, was indicated by a report of the membership committee made at a meeting of the executive committee in Cincinnati, Ohio, on Jan. 27 by Chairman C. E. Morgan. Applications of seven sectional associations which are listed elsewhere in this issue were approved at the meeting. Additional applications from the Maryland Utilities Association and the Central Electric Railway Association were received too late to be submitted to the executive committee.

The report of the membership committee, supplemented by a special report from General Secretary J. W. Welsh, also indicates that the plan of consolidating the financing of the managing director's office with the general dues of the association is meeting with the approval of the industry as evidenced by the payment of dues to date. It seemed obvious from the figures submitted that the budget estimates for the year, upon which this year's dues were based, were approximately correct, and that the association may expect to complete the current year in sound financial condition if the present trend of dues payments by member companies is maintained.

The executive committee met at luncheon in the Queen City Club as the guests of Walter A. Draper, president Cincinnati Street Railway. Those present at the meeting included the following: R. P. Stevens, president, C. E. Morgan, L. S. Storrs, T. B. MacRae, J. S. Kubu, R. H. Dalgleish, H. H. Norris representing Edward Dana, A. J. Manson representing M. B. Lambert, E. F. Wickwire, T. W. Casey, D. W. Snyder, Jr., Thomas Finigan representing W. S. Cutler, J. R. Fitzpatrick, Robert I. Todd, J. W. Welsh, R. F. Carbutt, F. G. Buffe, H. L. Mitchell, W. W. Holden, H. B. Potter, J. P. Pulliam, P. G. Carlton representing R. B. Stearns, W. S. Rodger, W. E. Wood, W. R. Power, W. A. Draper, Thomas Conway, Jr., Thomas Fitzgerald, Charles Gordon, Claude Van Auken, F. C. J. Dell, Leslie Vickers, G. C. Hecker, C. J. Murphy, Lambert St. Clair.

In the absence of Chairman Paul Shoup, the report of the publicity committee was presented by Mr. Welsh. The principal point being stressed in this year's work is that of the need for an adequate fare by electric railways. The report indicated that good use is being made of the Association's moving picture films which were prepared last year. The entire group of twenty films has been in almost constant circulation since they were prepared.

Because of the fuller attendance at this meeting than at the last meeting of the executive committee, Thomas Conway, Jr., chairman of the sub-committee on depreciation of the National Relations Committee reviewed the status of the work being done with respect to the matter of depreciation hearings before the Interstate Commerce Commission. Dr. Conway explained that the hearings before the commission on electric railways have been put over until the commission has finished with the re-hearings of the steam railroad and the telephone cases. Further sessions on these re-hearings are scheduled to start on March 14.

Dr. Conway reported that his committee has held a number of meetings in the preparation of the electric railway case for presentation before the commission. Data has been received from a total of about 40 companies representing a large proportion of electric railway mileage. It is now estimated that the electric railway case will not come before the commission until sometime in the spring.

The seriousness of the depreciation hearings to the electric railway industry cannot be over-estimated, according to Dr. Conway and his committee. Information already received from representative properties indicates that an order similar to that applied to the steam roads would produce a large immediate increase in operating expense charges of electric railway properties. This would seriously handicap the present program of improvement and rehabilitation just as the industry is emerging from the series of almost insurmountable obstacles and handicaps with which it became burdened during the post war period. An order such as the commission issued in the case of the steam roads would affect all electric railways, in the opinion of the committee, and would not be limited only to those roads reporting to the Interstate Commerce Commission. If the Federal Commission should issue a depreciation accounting order, Dr. Conway explained, the various state commissions which have adopted the Interstate Commerce Commission's classification of accounting, would be very likely to follow any policy with respect to depreciation accounting that the Federal commission might lay down.

The need for setting up adequate depreciation accruals is recognized by the electric railways, in the opinion of the committee, and there is no disposition on the part of the industry to question the commission's authority. It is the intention of the committee to strive for an order which will permit electric railway fares and income to be adjusted gradually so as to make possible the setting up of adequate depreciation accruals without doing this in such a manner as to wreck the industry's credit and prevent it from continuing the process of improvement which it has been making such a valient effort to carry out under the obstacle of inadequate revenues. Dr. Conway reported further that there is no intention on the part of the committee to waive any of the rights of individual members to testify for themselves before the commission.

A report for both the managing di-

Digitized by Google

rector's office and for the Committee on National Relations was made by Managing Director L. S. Storrs in the absence of Chairman J. H. Hanna. Mr. Storrs said that a number of sections of the Federal Transportation Act are becoming of increasing interest to electric railways as the growth in the freight business of many interurbans brings them more nearly into the classification of railroads. Appointment of C. D. Cass as assistant to the managing director, to handle some of the many duties arising from Washington developments which affect the interests of electric railways was confirmed by the executive committee for such period as his services may be necessary. The expense of this work is being assumed by several properties whose interests in the developments are directly affected.

Mr. Storrs announced the findings of the committee of judges on the Anthony N. Brady Safety Award. The medals in each of three classes were won by the Louisville Railway, El Paso Electric Company and the Tide Water Power Company, respectively. Formal presentation of the awards is to be made at a meeting to be held under the auspices of the American Museum of Safety in New York, on February 17th.

Activities of the committee on co-operation of manufacturers will, according to a report by Chairman Wickwire, be directed along lines suggested by Managing Director Storrs; i.e., promotion of a basic 10-cent car fare for electric railways. The committee is at present co-operating in the preparation of an album containing pictures illustrating the industry's early days and showing by contrast with newer types of equipment, the progress which has been made.

Resolutions covering conditions to be observed by exhibitors at the annual convention, somewhat similar to those which have governed during several years were passed by the executive committee. These resolutions are printed elsewhere in this issue.

A request by the educational committee, that the educational luncheon which was held under the auspices of the committee at the last convention, be made one of the regular luncheon meetings on the convention program this year, was referred to the program committee.

Leslie Vickers, economist of the Association, reporting for the committee on taxation, said that an effort has been made in co-operation with other organizations to obtain a reduction in federal corporation taxes. He called attention to a legislative matter of considerable importance to utilities; namely, the amendment to the tax bill by Representative Garner which eliminates from the bill Section 118, which permitted consolidated reports to be filed for several companies. Mr. Vickers emphasized the importance of striving to have Section 118 put back in the bill.

Based upon figures covering the budget for the 1928 Cleveland convention, the executive committee voted to charge a rate of 60 cents per square foot for inside exhibit space at Cleveland. The rate for outdoor track space will be $2 per lineal foot. These rates were decided upon after a careful analysis of the convention budget and estimates of the probable sale of space. It was the intention of the committee in setting the 60-cent rate, to provide an income which would just balance convention expenditures.

Convention committee appointments by President Stevens were read by Secretary Welsh. These were printed in last week's issue of ELECTRIC RAILWAY JOURNAL. Reports of progress being made by the several affiliated associations were made by T. B. MacRae for the Accountants Association, J. S. Kubu for the Claims Association and R. H. Dalgleish for the Engineering Association. Mr. Kubu read a draft of an imputed negligence law proposed by the Claims Association, which President Stevens referred to the policy committee. Mr. Dalgleish was granted authority, upon request of the Engineering Association, to ask manufacturers of new types of electric railway truck drives for contributions not to exceed $500 each, to defray the cost of tests on new type drives, to be conducted by the Bureau of Standards in Washington.

Representatives from various state and sectional associations attending the executive committee meeting were called upon by President Stevens for brief comments. These included F. G. Buffe, Midwest Electric Railway Association; H. L. Mitchell, Pennsylvania Street Railway Association; W. W. Holden, Southwestern Public Service Association; J. P. Pulliam, Wisconsin Utilities Association; R. F. Carbutt, Metropolitan Section; P. G. Carlton, representing R. B. Stearns, New England Street Railway Club; W. E. Wood, Virginia Utilities Association; W. S. Rodger, Central Electric Railway Association and W. R. Power, Kentucky Utilities Association. Mr. Buffe invited the executive committee to hold a meeting in Kansas City at the time of the next Midwest Electric Railway Association meeting there late in May or early in June. A similar invitation was extended by Mr. Holden for the Southwestern Association.

At the end of the business meeting a review of statistics and trends in the industry was presented by E. J. Murphy, statistician of the Association. The next meeting of the executive committee was fixed for March 30 at Association Headquarters, New York.

Engineering Executive Committee

MANY projects of the Engineering Association were reviewed at a meeting of the executive committee held at association headquarters, New York, on Jan. 30. Members present were President R. H. Dalgleish; vice-presidents F. H. Miller, W. W. Wysor and L. D. Bale; past presidents C. H. Jones, P. V. C. See, F. McVittie, E. M. T. Ryder and G. C. Hecker; and Daniel Durie and Charles Rufus Harte. Committee chairmen H. H. George, H. F. Brown and J. Y. Bayliss were also present.

Announcement was made that appropriations for the study of rail corrugation by way and structures committee No. 12, car design by rolling stock committee No. 3 and noise reduction by rolling stock committee No. 9 were approved by the executive committee by letter ballot and were authorized at the American Association executive committee meeting held Nov. 11.

The final report of the subjects committee was approved by letter ballot, and complete assignments for committee work have been sent to all committee members. In connection with the design of a proposed standard track switch for a 200-ft. radius, the question arose as to whether standardization of track switches is necessary or desirable. It was decided to go ahead with the design of the switch without reference to standardization.

A report on revision of rules of procedure was made by Mr. Miller. The method of taking letter ballots received considerable attention. On motion of Mr. Miller, seconded by Mr. See, it was decided to continue for another twelfth month the procedure of adoption of standards by letter ballot according to the method used last year.

Announcement was made that a meeting of the committee on revision of constitution and by-laws would be held to bring the constitution and by-laws of the Engineering Association in line with the changes adopted by the American Association at the last convention.

The editing of the association's proceedings was discussed, the idea being to reduce the volume by eliminating all extraneous material and abstracting such papers as do not seem to have permanent value sufficient to place them in the records in full. Since the volume of proceedings for the current year had already been set in type, it was decided to make no change in the form until next year.

It was pointed out that a change in the style of numbers in the engineering manual had been authorized last year so that the new sections do not repeat a number in words and in figures. On motion of Mr. Jones, seconded by Mr. Miller, it was decided to make the changes in new sections and those sections which come up for revision so that they will be changed over to the latest form as quickly as possible when reprinting.

The results of a number of letter ballots on Manual sections were reported. A new letter ballot on special track work was approved for submission to the membership. The Manual Committee was authorized to make editorial changes where necessary in one of the Manual sections.

On the subject of convention pro-

Digitized by Google

grams, it was voted to appoint committees to prepare programs for each of the main divisions and that the chairmen of the standing committees, with others to be appointed, should constitute a committee to prepare the program for the joint session.

In connection with the presentation of committee work on the convention floor, Mr. George recommended that brief abstracts of each special committee report be prepared so that they can be presented in a minimum time.

The afternoon session of the executive committee was given over to presentation of progress reports by the chairmen of the several divisions and a number of announcements by the secretary.

Several Manual revisions were brought to the attention of the committee.

Mr. Bayliss, chairman of the purchases and stores division general committee, told of joint work that is being done with the Accountants Association. It was voted by the executive committee to approve this arrangement as it was thought that the two groups have much in common and should arrange to do as much work together as they can.

For the heavy electric traction committee, Chairman Brown told of the plans for the year. The work will be along the lines laid down at the last convention. Mr. Brown referred to possible duplication of committee work. This has been referred to in the report of the committee on heavy electric traction.

Mr. See made a brief report on behalf of the rolling stock division telling of the status of the committee work, and Mr. Bale made a similar report for the power division.

A proposal was made to study the application of labor saving machinery in shops. This proposal was discussed at some length. It was thought that such equipment is of great value today, and it was voted to appoint a committee to investigate the value of such equipment.

On the subject of concrete poles, there was a question raised as to the advisability of including special types of concrete poles in the assignments to the proper committee. It was decided to leave this matter until next year.

Considerable time was given over to announcements of the various American Engineering Standards Committee activities in which the association is interested. Co-operative work being done with the Division of Simplified Practice of the U. S. Department of Commerce and with a number of other associations was also referred to.

Motor Drives to Be Tested

PLANS for testing the most recent type of motor drive were made at the meeting of a sub-committee of rolling stock special committee No. 3 on car design. This meeting was held at the Bureau of Standards in Washington, D. C., on Jan. 19. At the meeting were present Dr. H. C. Dickinson, Dr. M. D. Hershey and S. A. McKee, all of the Bureau of Standards; President R. H. Dalgleish of the Engineering Association; H. H. Adams, chairman of special committee No. 3, and C. Bethel, W. J. Clardy, F. H. Pritcher, C. A. Burleson, N. R. Brownyer, H. C. Maddux, A. L. Kasemeier and J. A. Brooks.

Arrangements for the test were discussed in detail. It was decided that the various elements of the drive units should be tested separately. For instance, universal joints, reduction units, and journal bearings would each be tested for its efficiency, the tests being made from standstill up through the entire speed range. By means of these tests it will be possible to determine the relative efficiencies between journal bearings of the anti-friction type and plain bearings. The tests will be made with the lubricants recommended by the manufacturers and later tests will probably be made with lubricants selected by the Bureau of Standards that will represent as nearly as possible conditions to be met in cold temperatures. Representatives of the Westinghouse Electric & Manufacturing Company and the General Electric Company will look into the matter of supplying motors to be used as dynamometers.

The question of making road tests was left in abeyance for further consideration.

In all seven reduction units were submitted for consideration of the representatives of the Bureau of Standards.

New Association Members

FOLLOWING out the plan made possible by a change in the constitution of the American Electric Railway Association, adopted at the 1927 convention, seven state and sectional associations were elected to membership at the meeting of the executive committee held at Cincinnati on Jan. 27. Besides these there were two associate members and 33 individuals elected. The list of new association and associate members follows:

ASSOCIATE MEMBERS

American Appraisal Company, consulting engineers, Milwaukee, Wis.

Richard Sachse, consulting engineer, Los Angeles, Cal.

STATE AND SECTIONAL ASSOCIATIONS

Arkansas Utilities Association, Little Rock, Ark.

Canadian Electric Railway Association, Toronto, Ont.

Iowa Electric Railway Association, Davenport, Iowa.

New England Street Railway Club, Boston, Mass.

Oklahoma Utilities Association, Oklahoma City, Okla.

Public Utilities Association of Virginia, Richmond, Va.

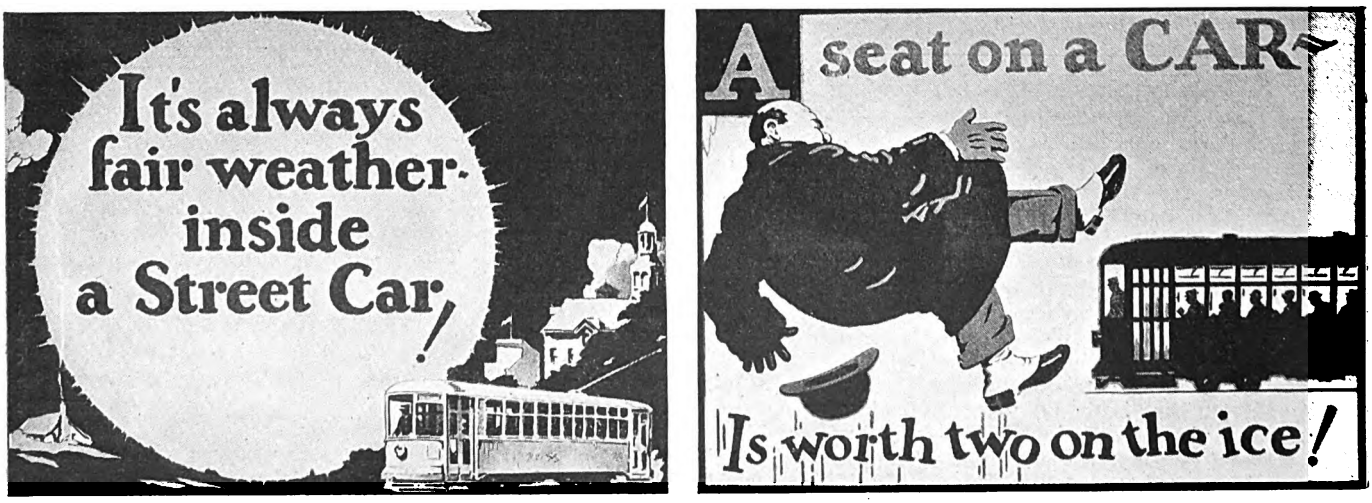
Southwestern Public Service Association, Dallas, Tex.

Posters Stimulate Winter Riding

POSTERS to aid in inducing car riding during the winter months have been prepared by the advertising section of the American Electric Railway Association under the supervision of the manufacturers committee on co-operation, of which E. F. Wickwire is chairman.

"It's always fair weather—inside a street car!" and "A seat on a car—is worth two on the ice!" are the inducing words on the attractive posters.

They are being offered to manufacturers as well as to electric railway operators and can be obtained directly from the association's advertising section at a nominal price. A limited quantity will be distributed free to manufacturers.



Attractive posters to stimulate street car riding during the winter months

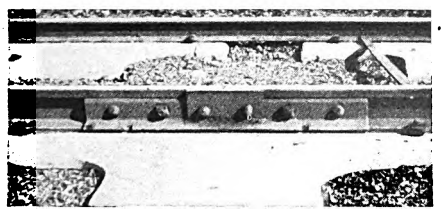
Maintenance Methods and Devices

Manganese Bridging Plate Prevents Cupping

MANGANESE plates, which bridge the rail joint plates to give ½-in. bearing surfaces for the wheels, are used by the Pittsburgh, Harmony, Butler & New Castle Railway. These plates have prevented the usual cupping at the rail ends. Each plate is 3¾-in. high and ⅜-in. thick, except for the top face or bearing surface, which is ⅝-in. thick. The manganese reinforcement is secured by two bolts passing through the two inner holes of the joint plates and the end holes of the rail. It is then welded to the bottom flange of the joint plate as shown in the accompanying drawing.



The manganese reinforcing plate is secured by two inner bolts

Where the cupping is advanced, the plate is secured by bolts passing through the second and fourth holes. The welded bridging plates have been used for two years and have proved satisfactory.

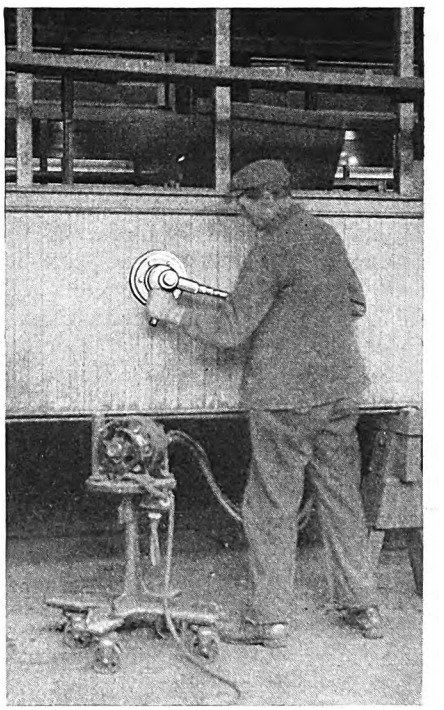
Mr. Fisk says it is "time to retire"—your out of date equipment.

Power Sander Speeds Car Work

WHERE large surfaces, such as the sides of cars, must be prepared for painting, sanding by the use of blocks covered with sandpaper is slow and tiring to the workman. In the shops of the Twin City Rapid Transit Company, St. Paul, Minn., electric sanders are used largely for this work. The accompanying illustration indicates the method of using the sander.

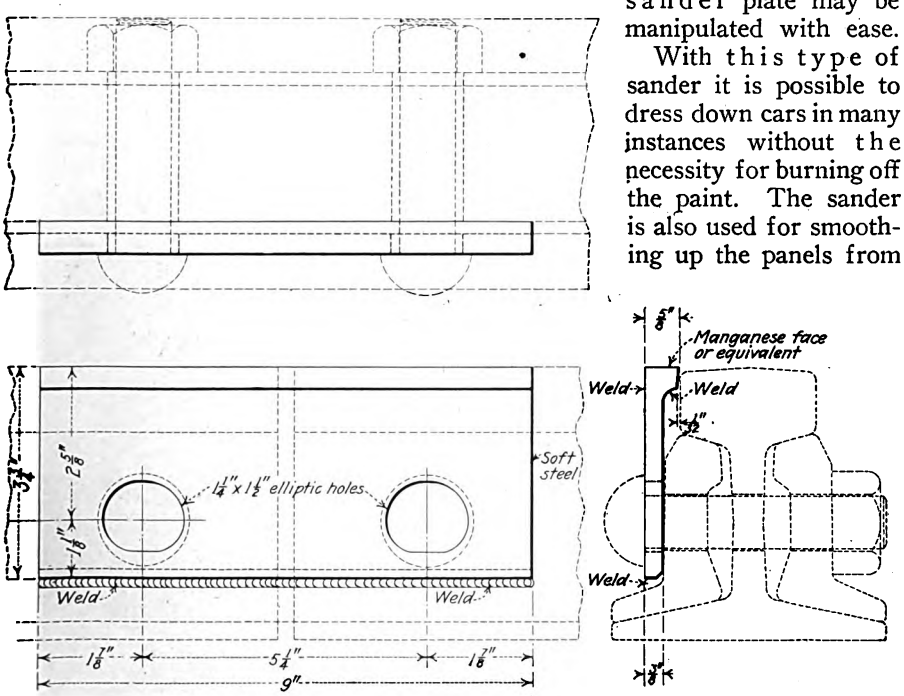
The sandpaper is placed on a circular plate of steel, which is driven by bevel gearing and a flexible shaft from a small motor. The device is mounted on a portable stand. As the workman moves along the car the motor stand is moved readily by a pull on the flexible shaft. Little difficulty is experienced in keeping enough slack so that the rotating sander plate may be manipulated with ease.

With this type of sander it is possible to dress down cars in many instances without the necessity for burning off the paint. The sander is also used for smoothing up the panels from which the paint has been burned off.



This motor-driven sander makes the preparation of the car for painting an easy matter

The sander also can be used wherever sandpapering is required. It does excellent work in smoothing off floors and smoothing off car roofs before the canvas is put on. It is even used on old roofs where the paint has become badly cracked. Where it is necessary to do sandpapering work above the floor level it is an easy matter to suspend the sandpapering machine from an overhead crane or runway so that it can be moved easily.



The plate is welded to the bottom flange of the joint plate and to the upper part of the rail

Punch Used to Form Switch Iron Handles

LOOPED switch iron handles are formed on a punching machine in the shops of the Chicago Surface Lines. The equipment used was illustrated in the brief submitted by the railway for the Coffin Award. Two strokes of the forming punch are needed to complete the loop, which is but partially formed at the first stroke. One heat is all that is needed in the forming, since the time lost between the first and second strokes is but a short interval, necessary for turning the piece over.

New Equipment Available

Sleeve Connector

PLUG, socket and tapered sleeve form a three-part connector placed on the market by the Columbia Machine Works and Malleable Iron Company, Brooklyn, N. Y. It is designed particularly for use in connecting motor leads, storage batteries, compressors and other apparatus used by electric railways. The plug section is formed by reducing the diameter at one end, the opposite being bored to two diameters for cable strands and insulation. At about the center of this section a thread is cut, which is engaged by the thread of the tapered sleeve. The socket part is bored and reamed, the opposite end being drilled two diameters for cable strands and insulation. The outer diameter of the female end of the socket is turned with a rather abrupt taper and is slotted to form prongs, which are drawn down rigidly on the plug section by the tapered sleeve. With the exception of slotting the socket with a milling machine saw all of the parts are made by lathe turning, and so particular accuracy is insured. The plug and socket parts are soldered on their respective cables and ample threads of the plug and tapered sleeve are provided for wear.

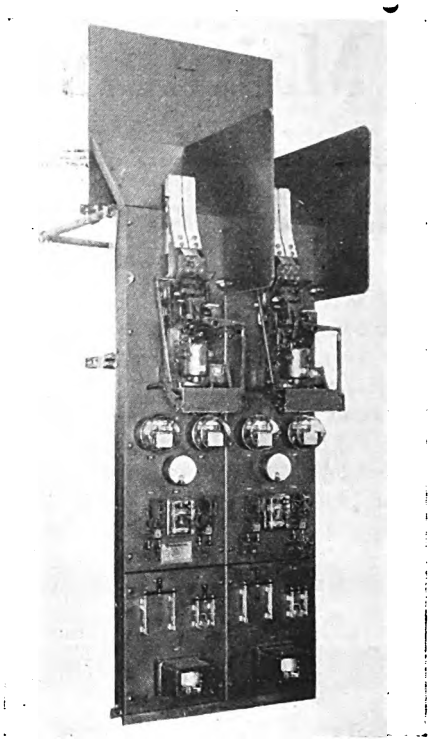
Heavy-Duty Circuit Interrupters

INCREASED demand by railways and other distributors of direct-current power for automatic and semi-automatic substations has made necessary a strong circuit breaker that can interrupt large overloads a great number of times and still be in condition to carry its rated load without overheating and without immediate repairs or cleaning.

This demand is being met by the Westinghouse Electric & Manufacturing Company through the production of its type CH carbon circuit breaker. This breaker is now being made in 2,000, 4,000 and 8,000-amp. ratings, 750 volts. The 2,000 and 4,000-amp. ratings can also be used on 1,500 volts. These breakers are not provided with self-contained overload coils, but can be made to trip on overload by means of relays. They are provided with a closing magnet and a detachable pole handle to close the breaker by hand in case of loss of voltage on the closing circuit. Feeder breakers are usually provided with a shunt trip which opens the breaker when the short circuit detector operates to energize the coil.

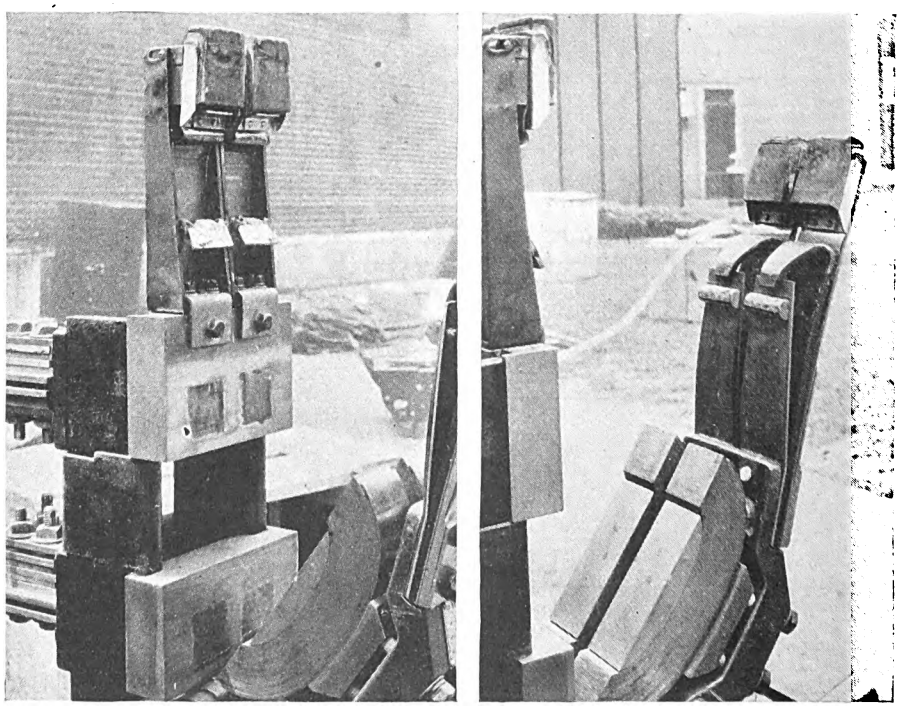
The type CH circuit breaker has a very wide opening between the arcing contacts when in the open position and the opening between the stationary contacts and the brush is also large, making it impossible, especially in the pedestal type, for the arc gasses to hover close enough to the live parts to maintain an arc between the moving and stationary contacts when opening a short circuit of any magnitude that can be produced by any existing concentration of direct-current rotating machines.

Through the courtesy of L. D. Bale, superintendent of power Cleveland Railway, the Cedar Avenue substation was made available for testing the CH breakers. An accompanying illustration shows the condition of the moving and stationary contacts after 260 operations opening 20,000 to 30,000 amp. at 600 volts. The Cedar Avenue substation has eight 1,500-kw., 600-volt rotary converters, all of which were running. The fact that the converters at Cedar substation were of a design without high reluctance commutating poles and consequently were liable to flashovers if subjected to too great an overload, together with the necessity of giving first consideration to the facilities of the railway, prevented placing of greater overloads on the breaker.



Switchboard with two 4,000-amp. CH circuit breakers

The 4,000 and the 2,000-amp. CH breakers have also been tested for interrupting capacity in the Westinghouse high power direct-current laboratory on overloads up to 40,000 amp. with similar results to the tests made in Cleveland.



Contacts after opening 20,000 to 30,000 amp. 260 times.

News of the Industry

Little Progress on Boston Bill

THE bill calling for a 15-year extension of the public control of the Boston Elevated Railway will not have as smooth sailing through the Massachusetts Legislature as was expected. Many complications are developing. The first hearing on the bill was regarded as unsatisfactory since only a small amount of information was brought out to guide the legislative committees.

At the suggestion of Governor Fuller and others the committees have voted to ask the Boston Elevated directors and some of the leading stockholders to appear at a public hearing to give their views on the merits of the pending bill, and on the future of the road. The governor also suggested that the committees should call Joseph B. Eastman, chairman of the Interstate Commerce Commission; James F. Jackson former chairman of the Elevated board of public trustees and of the Massachusetts Department of Public Utilities, and Andrew Marshall, a former member of the Elevated board of trustees and others.

There is much sentiment on Beacon Hill in favor of a return of the property to the owners, and also for the immediate acquisition of the road by the state.

The redeeming feature of the present situation is that the Legislature took hold of the question as the very beginning of the session and will have plenty of time to deliberate over it and decide upon some solution. A feeling seems to be developing in the western part of the state that the Commonwealth should not do too much for the Boston Elevated unless it is willing to do the same for electric railways in other parts of the state. The country senators and representatives are inquiring along this line.

Bureau to Send Out Virginia News

The Virginia Public Utility Information Bureau has recently been organized with headquarters in Richmond. Allyn B. Tunis is director.

Baltimore Fare Decision Deferred

Final decision in the application of the United Railways & Electric Company, Baltimore, for an increase in fare from 7½ to 10 cents has been delayed by the Maryland Public Service Commission until after Feb. 10. Hearings in the case were concluded in December.

Before acting on the fare case the commission will determine the valuation of the company's easements. This valuation was placed at $7,000,000 by the commission last summer, but the case was carried through the courts. The Maryland Court of Appeals ruled that the commission should value the easements but said that the method used was wrong. So the case went back to the state body.

Franchise Extended Again in Chicago

Another 30-day extension of the franchise of the Chicago Surface Lines has been granted by the City Council. This extends the franchises until Feb. 29.

Schenectady Fare Hearing Postponed

Hearing before the Public Service Commission scheduled for Feb. 1 at Albany on the petition of the Schenectady Railway, Schenectady, N. Y., for permission to increase its fare rates has been postponed. Postponement was due to the application by the city for a writ prohibiting the commission from proceeding with the question. The city alleged that rates on some lines were fixed by franchise restrictions.

Seven-Cent Fare Asked in New York

Interborough Rapid Transit asks commission for that rate, failing which it will seek court aid. The company sets up claim of confiscation

DIRECTORS and officers of the Interborough Rapid Transit Company, New York, have reached the conclusion that definite action must be initiated by them by filing 7-cent fare schedules to secure for the company's investors and for the public substantial relief from the conditions now existing. The company takes the position that the policy of the city of New York and the attitude of the Transit Commission thus far, under the advice of special counsel to that body, have brought about conditions which compel protective measures in public interest. It says:

A rate of fare of 7 cents per passenger on each subway division and Manhattan division operated by the Interborough company will constitute no more than a just and reasonable rate of fare on each division respectively and will yield no more than a fair and reasonable return upon the value of the properties actually used by it in the public service in its operation and devoted to the public service and no more than a reasonable compensation for the service so rendered.

In order to aid in the preparation and presentation of the matter along the lines which have been recognized and upheld by the courts as to other public utilities, ex-Justice William L. Ransom, who has had considerable experience in that field, has been retained as counsel. He will assist counsel for the company in bringing before the Transit Commission and the courts the facts which have impelled the company to action.

The company has repeatedly pointed out to the public authorities the urgent need that it be permitted to charge fares and earn revenues which will reflect the present price level and enable the company to meet with maximum efficiency the needs of those dependent on its facilities. It contends that all of its efforts to induce fair and businesslike consideration of the pressing problems have led only to violent political attacks and to drastic threats of oppression, designed still further to destroy the company's credit and its ability to fulfill its obligations to its patrons. A statement by the company says:

Under these well-known circumstances the directors of the company have decided to take the necessary steps to exercise and establish the rights of investors and patrons. The matter will be removed from the forum of vituperative assertion and harangue, and the pertinent law and facts definitely established. Our expectation is, of course, that the Transit Commission, in its quasi-judicial capacity, will treat the matter fairly and diligently, as the urgent conditions demand; but we squarely face the probability that the right of this company to charge a fare which will enable it to perform its public functions and escape confiscation will be brought before the courts for clarifying review and for final determination, unless the action of the Transit Commission is along lines which make that review unnecessary. The steps now taken have proved to be the only way of dealing with the extremity to which we have been forced.

The petition filed with the Transit Commission tells its own story and summarizes the grounds of the company's application. The company cannot continue to render a 1928 service at 1928 costs of materials and rates of pay of labor, at a rate of fare fixed in 1913, based upon the wages, costs and purchasing power of money then prevailing. Every business man knows the force of the economic conditions which compel this change in fares. The orders of the Transit Commission, the threats of its special counsel and the radical change in the city's policy since 1913 have intensified and aggravated the effects of the changed price level.

The Interborough Rapid Transit Company does not desire to charge more or less than the rate of fare which will conservatively enable it to pay proper wages and meet present-day operating costs, together

Digitized by Google

with an adequate return upon the property devoted to the public service, in order that its credit may be so restored that it may procure sufficient new capital for improvements. It is unwilling longer to impair its service by trying to skimp along on revenues less than its fair right. Like other public service companies, it should charge neither more nor less than a reasonable fare, based on elements recognized by the courts, and subject to revision downward or upward as costs and conditions require.

That is the established and generally recognized right of other public service companies, with excellent results for the public by way of first class and adequate service. We believe it is likewise our right and our duty to seek it.

It should be remembered that in no event can the company make a dollar of profit from an increased fare in excess of the amounts which it is entitled to retain under the terms of its contracts with the city.

As the purchasing power of the 1928 dollar is approximately 60 cents, it will be appreciated that a 7-cent fare has a purchasing power somewhat less than the 5-cent fare of 1913.

2 per Cent Participation Earned by Philadelphia Men

The co-operation of employees of the Philadelphia Rapid Transit Company, Philadelphia, Pa., during 1927 has earned them the 2 per cent of P.R.T. gross earnings promised for added efficiency. President Senter says, however, that even greater effort will be necessary to earn a similar added wage in 1928.

The closing months of 1927 brought a falling-off in earnings because of depression in industrial activity. Mr. Senter said:

We must be wide awake to the need for economy in every department, so that operation may be kept at the lowest cost consistent with good service. At the same time we must do everything possible to increase riding. A more attractive service will largely offset a temporary loss in normal riding. You can make car, bus and cab riders out of people who now use their private automobiles or walk. Attractive service means constant courtesy, regular spacing of cars, clean and bright equipment, and the thousand and one added touches which nobody knows so well as the man on the job.

Once we had the transportation field to ourselves. Now the private automobile is striving with us to serve the public's transportation needs. We are in a battle. Speed, comfort, economy and convenience are our weapons.

Let us fight hard, but let us at the same time stick to the rules of the game. While putting our own best foot foremost let us not trip up the other fellow. This means that we must give a square deal to all users of the city streets—the 20 per cent who use their own private cars, as well as the 80 per cent who depend upon us for transportation. In helping others we help ourselves, and that goes in heavy traffic as truly as anywhere else in life.

Subway for Milwaukee

A half-mile subway and rapid transit line on an east and west right-of-way unobstructed by street crossings and arranged to improve greatly street car traffic conditions was announced on Jan. 31 by S. B. Way, president of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

The plans for the immense improvements, to cost in excess of $4,000,000, have been submitted to Mayor Hoan and have been approved by him and within a few days will be sent to the Common Council for its approval.

The new right-of-way will run from a junction on the rapid transit lines on Fortieth Street east generally along the north bluff of the Menomonee valley, entirely free from both grade crossings and street traffic, to a point on Eighth Street north of St. Paul Avenue. At this point the subway will begin.

From Eighth Street and St. Paul Avenue all trains operated over this line will run underground into the Public Service station at Third and Michigan Streets. In addition to the subway the line will have two stretches of elevated tracks, 500 feet across Hibernia Street and 1,100 feet on St. Paul Avenue east of Twenty-fifth Street. The entire length of the new project is 2.8 miles.

Running Street Car in Window Big Attraction

A miniature street car in a window of the Arkansas Power & Light Company's offices in Little Rock, Ark., that actually ran up and down a track representing Main and Fifth Streets of the city attracted favorable attention recently. There was a guessing contest in connection with the event, which was a part of the traction company's big advertising campaign to center attention upon the electric railway system. The car actually ran 95 miles, but guesses ranged from a fraction of a mile to 1,000,000 miles.

Group Insurance for Wisconsin Valley Employees

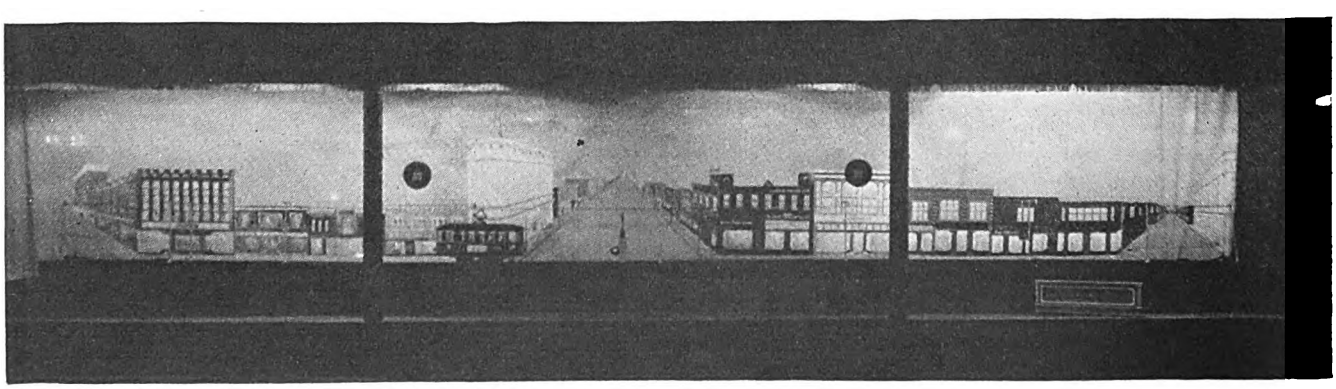
The Byllesby group insurance plan covers all employees of the Wisconsin Valley Electric Company, Wausau, Wis., and its subsidiaries effective Jan. 1, 1928. An announcement to this effect was made recently by H. L. Geisse, general manager of the company.

W. H. Montross, general superintendent, will supervise this insurance work on all properties of the company There are 324 employees eligible for this insurance.

Being Neighborly in Elmira Paid

"What's wrong with our service"? And then followed an avalanche of complaints, vituperation and even profanity. That was fifteen years ago in Elmira, N. Y. But with that discouraging beginning Frederic H. Hill, vice-president of the Elmira Water, Light & Railroad Company, laid the foundations of good will so that today its officers are in demand as speakers in schools, at luncheons and at community groups. The answer as told by Mr. Hill in the December issue of *Nation's Business* is "keeping a public utility human." Today the company can boast of successful customer-ownership campaigns, a personnel with good home talent operating its services sometimes on part time and in school vacation periods.

As an example of co-operation on the part of the employees he said that in a recent drive to stimulate interest in better home lighting 63 per cent of the employees took part. An average of more than six cartons of frosted lamps per employee was sold, the railway department selling the most. Among the leaders were five conductors. Some of the trainmen had become well acquainted with their passengers and sold many lamps on the cars.



Window display depicting street car operation in Little Rock attracted much favorable attention

Digitized by Google

Of course, there are some complaints in Elmira, but they are a matter of routine. However, there are no longer any tricks "because we are not soulless."

85,248 Handled in Rochester Subway in Month

Passenger traffic on new subway railroad in the bed of the abandoned Erie Canal at Rochester, N. Y., totaled 85,248 for December, its first month of operation, James F. Hamilton, president of the New York State Railways, operators of the railroad, has announced.

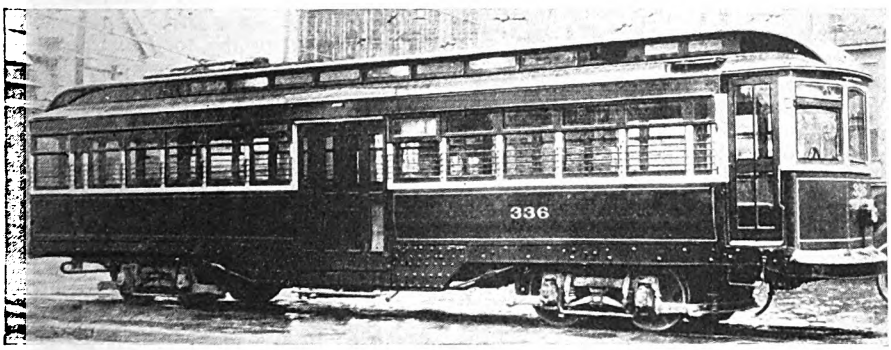
In view of the limited operation of the subway so far, part time service only being maintained, railways officials expressed gratification over the showing for the first month.

Passengers within the city totaled 59,680, while those on the Rochester & Eastern interurban line, which uses the subway, totaled 25,568.

It is expected that installation of the automatic signal system, lack of which is preventing complete operation of the line, will be completed by Feb. 15. When this work has been finished, two-minute trolley movement will be possible. Fifteen-minute service has been in order under the present experimental stage of the subway operation, with only two cars running. Mr. Hamilton said:

> When the installation of the automatic signal system is completed, it will be possible to operate cars according to the demands of traffic. A clear track one or two stations ahead will be indicated by green lights; yellow lights will indicate distance of only one station clear. Red lights mean stop.

The Rochester & Syracuse and the Rochester, Lockport & Buffalo interurban railways will use the subway as soon as switching installation and signal work are finished. Special work is required for the Rochester & Syracuse connection because that line is double tracked on right-track operation while the subway railroad is on left-track operation.



Type of car operated on new subway at Rochester by New York State Railways

Informative Pamphlet on Illinois

"Know Illinois," the second edition, compiled by the Illinois Committee on Public Utility Information, has been circulated far and wide. This booklet gives in condensed form some important statistics about Illinois.

Governors Deliver Annual Messages

Emphasis laid on transit before Massachusetts body—Governors of New Jersey, North Dakota, Virginia and Rhode Island report

AN ECHO of Governor Smith's idea of transportation as a factor in community life, mentioned in his annual message and referred to in the ELECTRIC RAILWAY JOURNAL issue of Jan. 7, 1928, was heard in the words of Governor Alvin T. Fuller of Massachusetts in his address to the Legislature of Massachusetts. He said that he regarded the Boston Elevated Railway situation the paramount problem before the Massachusetts Legislature this year. That public control through public trustees would enable prompt carrying out of many needed improvements and additions, and would bring the system up to that degree of efficiency and accommodation to which the metropolitan area was entitled was his belief. Generally speaking, he favored a short rather than a long extension of public control. He suggested careful consideration of the problems of additional subway facilities so as to reduce the burden on the car rider. He said that he would be happy at all times, and whenever convenient, to collaborate in the preparation of a bill that would be fair to the traveling public without being unfair to the stockholders, and which would, at the same time, provide for the extension of the rapid transit system and improve transportation facilities. There was no one thing before the Legislature with the opportunity of doing so great a service to large numbers of people as the proposed legislation, which had as its object, improved transportation facilities for the metropolitan district.

Across the Hudson River, Harry Moore, Governor of New Jersey, addressed his second annual message to the 152nd Legislature of New Jersey on Jan. 10. He stressed the necessity for improvement of facilities for carrying commuters to and from New York City. The problem could not be solved by the state of New Jersey alone but had to be co-ordinated with improved transit facilities for New York City, Westchester County, Long Island and Staten Island. Two problems before the state of New Jersey were the regional or interstate problem—the matter of adequate communication with the city of New York, Westchester and Long Island, and the intrastate or local problem. He said it was clear that the creation of new, intrastate suburban passenger facilities in northern New Jersey were bound up with the interstate passenger problem. The Suburban Transit Engineering Board was actually functioning and developing an engineering plan. An encouraging point was advice that the Legislature of New York would follow the initiative taken by the state of New Jersey and would pass complementary legislation, enabling the Port Authority to proceed.

Lying, as it does, between the great metropolitan areas of New York and Philadelphia, New Jersey must care for traffic passing between these two states and having its shore line on the Atlantic Ocean for a distance of more than 150 miles, developed as resorts, it must likewise make ample provision for the traffic created thereby.

Other states whose governors made reports to the Legislature during January included North Dakota, Virginia and Rhode Island.

Governor Harry Smith Byrd told the General Assembly of Virginia, convened in regular session on Jan. 11, that the gasoline tax had vindicated those who were in favor of this tax for the purpose of building roads rather than floating bond issues. For 1927 at least $7,500,000 would be collected, and should go in 1928 into more than $8,000,000. The total road funds available for the next biennium, namely $32,004,680, was an increase of $1,100,000 available for street highway systems over the last two years. His report showed the assessments of the physical properties of each class of public service corporations for the years 1925, 1926 and 1927. For 1927 the assessment on electric railroads was $10,289,179; for 1926, $10,937,086, and for 1925, $10,574,866.

Motor vehicle transportation had made remarkable advancement since its regulation by the state, and sections of the state formerly isolated and inaccessible were now in easy and quick communication with adjacent communities.

Governor Aram J. Pothier of Rhode Island told the General Assembly at its annual January session that highway development was to continue so that the traveling public might share in the desired and desirable improvements.

Chicago Parking Issue Under Advisement

Court hearings on the injunction proceedings relative to parking in the loop district of Chicago, Ill., which were in progress on Feb. 1 have been concluded and the case has been taken under advisement until next week. The parking decree went into effect on Jan. 10. The various steps in the introduction of this ordinance and its passage have been followed in the ELECTRIC RAILWAY JOURNAL.

Municipal Ownership Suggested for Tacoma

Purchase of the railway system owned by the Tacoma Railway & Power Company, Tacoma, Wash., by the city of Tacoma, was urged at a recent banquet of the Young Men's Republican Club of Pierce County, by S. A. Perkins, Tacoma, candidate for republican national committeeman, and prominent newspaper owner. Mr. Perkins declared that if Tacoma had acquired its railways fifteen years ago "even paying five times the price they were worth, the city would be twice its size today," to say nothing of the benefits realized in avoiding the conflict at the city hall with the company during the past few years.

Four-Cent Wage Increase in Atlanta

An increase in wages just negotiated under a new contract between the Georgia Power Company and the Amalgamated Association, Atlanta, Ga., provides a wage of 50 cents an hour for the first nine months, 55 cents for the second nine months, 58 cents an hour thereafter, with a 7-cent differential for operators of one-man cars. This scale will continue until May 1, 1929, at which time a new schedule of wages will be drawn up.

The new scale is retroactive from Jan. 1, 1928. It means that motormen and conductors on two-man cars receive an increase of 4 cents an hour, and operators of one-man cars an increase of 3 cents an hour. All employees in the mechanical and roadway departments will receive an increase of 2 cents an hour.

Under the old scale motormen and conductors received 46 cents an hour for the first nine months of their employment, 51 cents an hour for the second nine months and 54 cents an hour thereafter. Since May 15, 1927, one-man operators have received 54 cents the first nine months, 59 cents the second nine months and 62 cents thereafter.

"The Public Servicer" to Appear Feb. 5

The Public Servicer is the name selected for the monthly employees magazine published by the St. Louis Public Service Company, St. Louis, Mo. It is the successor to the old *U. R. Bulletin* published by the defunct United Railways which ceased operations on Nov. 30, 1927. The first issue will be off the press on Feb. 5.

To secure a name for the new magazine the company offered cash prizes for the best title suggested. More than 350 replies were received. William Schwartz, an employee of the materials yards, won the first prize of $25. The second prize of $10 went to Edward Phelps, a company night watchman, who suggested *The Booster*, while Miss Marie Page, a daughter of a company conductor, won the third prize of $5. She suggested *Trolley Flashes*.

Higher Fares Don't Mean More Revenue, Los Angeles Hears

In a "memorandum" brought forth during the hearing on the application of the Pacific Electric Railway, Los Angeles, Cal., for higher fares, A. F. Mott, chief engineer of the California Railroad Commission, suggested three experiments on a limited scale and for a limited period of time in an effort to increase the revenue of the Pacific Electric Railway system.

First among these was the establishment of a Sunday and holiday pass, good within a radius of approximately 30 miles from Los Angeles, for unlimited use on any of the company's lines on the day for which it was sold—the price of this pass to be $1; second, the establishment of an off-peak low one-way rate in addition to the present established rate. The off-peak hours were given as between 9 a.m. and 4:30 p.m., and between 7 p.m. and midnight. A tryout might be made on the Venice-Santa Monica Lines; third, the establishment of a monthly pass good between Los Angeles and certain designated points, carrying with it the privilege of unrestricted use, not only on the interurban lines between the points for which sold, but also the privilege of unlimited local use within the primary zone of each terminal joint —the charge beeing about the charge for the present 60-ride commutation ticket.

Engineer Mott concluded by saying that the Pacific Electric should give "serious attention" to preventing the automobile from making further inroads on its business, and if possible, to win back to the fold patrons now using the automobile. He did not believe that fare increases were a means of increasing railway revenue.

The report contains figures of the effect of the Glendale experiment with lower fares. However, Mr. Mott admitted that the Glendale plan, although it had proved a "reasonable" individual success, did not absolutely prove that fare reductions of the same type would bring similar results over the remainder of the system. Fare reductions on the Glendale-Burbank line averaged 11 per cent.

"Riders That Do Not Count for 'More Revenue'"

The Virginia Electric Power Company, Richmond, Va., has reproduced a picture in the January *Vepcovian*, its house organ, showing the various coins passengers slip over for fares. They include a 2½-cent piece from Panama, a 2-cent piece from Mexico, a mutilated nickel, an aluminum slug, a 4-cent piece from Italy, a 2½-cent piece from Hungary, a brass campaign button and a brass drinking cup check.

Transit the Topic of the Hour in Philadelphia

A proposal for a new $50,000,000 transit development linking West Philadelphia, Pa., and Camden, N. J., by a high-speed line, was offered on Jan. 30 by Mayor Mackey of Philadelphia. This proposal was one of the features of an outline for the coming four years of his administration presented at a luncheon for the mayor and his directors by the Philadelphia Chamber of Commerce. His transit policies include, besides the link over the Delaware River Bridge, the Philadelphia Rapid Transit Company operation of the Broad Street subway beginning on Sept. 1 under a short-term agreement; Locust Street instead of Chestnut Street for subway; the Ridge Avenue-8th Street Loop, and the Randolph Boulevard for wide thoroughfare between Fifth and Sixth Streets as a bridge traffic feeder.

As an aid toward financing the proposed West Philadelphia-Camden high-speed line the Mayor said the Philadelphia Rapid Transit Company was willing to enter into an agreement prior to submission of the forthcoming $40,000,000 loan bill to the voters to pay interest and sinking-fund charges on that amount. He announced that the company had withdrawn its proposal that after it had by its payments, discharged the debt incurred for construction of an East-West subway, it should become owner. As outlined by Mr. Mackey, the city would retain permament ownership. With the company willing to pay $40,000,000 of the entire $50,000,000, the rest could be charged against earnings of the Delaware River Bridge.

On Jan. 27 Director Myers advised the Mayor that the recommendations of the Philadelphia Rapid Transit Company for changes in the City Hall Station and the underground walks of the South Broad Street unit of the subway were essential to adequate operation of the $100,000,000 line. His estimate of the city's outlay for the extensions was $6,000,000 and said that item, with Mr. Mackey's approval, would shortly be submitted to the City Council for inclusion in the April electorial loan.

He concurred in the suggestion of Ralph T. Senter, president of the Philadelphia Rapid Transit Company, that the city spend $250,000 for establishment of the feeder lines to the upper stretch of the subway, with the Philadelphia Rapid Transit Company making an outlay of $750,000.

Mr. Myers' report divided into five sections followed a conference with Thomas E. Mitten, chairman of the board of directors of the Philadelphia Rapid Transit Company, and a group of Eighth Street merchants, at which Mr. Mitten told them that the proposed Ridge Avenue extension of the Broad Street subway would be included in the plant worked out for operation of the city-built line. Another development was Mayor Mackey's announcement that the Broad Street subway would be ready for operation some time in August.

Recent Bus Developments

Stringent Regulations in New York for Safety Sake

To insure the safety of passengers in public buses operated by carriers under certificates of convenience and necessity issued by the New York Public Service Commission, that body will require all bus operators before putting a bus conveyance in operation to submit a statement showing the type and character of buses used, type of heating equipment, form of notive power and type of brake equipment. Where a bus operator buys and operates a bus which has been in use before, the commission requires that it be notified of the mileage to date, the physical condition and other information which may be pertinent in the interest of safety.

Higher Tax on Connecticut Buses

The Connecticut Company, Hartford, Conn., has filed suit in the Superior Court to prevent the city of Hartford from taxing its 26 buses. In the petition it is claimed that the taxes paid on the buses in the State are in lieu of all other taxes to municipalities making the city's tax illegal. A plea in abatement and to the jurisdiction has been filed by the city in which it is alleged that the Connecticut Company has not appealed from the doings of the assessors to the board of relief, as provided in the statutes. The city moves for this reason to ask that the case be thrown out of court on the grounds that the Superior Court is without jurisdiction in the case at this particular stage.

The Connecticut Company states that since 1922 it has paid 3 per cent of its gross earnings within the State to the State, less certain deductions.

The city has assessed the buses for $95,000 and laid a tax of $2,011 on them as follows: $1,916 for city tax and $95 for school tax.

Expansion by Los Angeles Railway

Figures for 1927 show that the operations of the motor coach division of the Los Angeles Railway, Los Angeles, Cal., increased about one-third over 1926.

Two entirely new lines were added, Mines Avenue and Whittier Boulevard line and the Crescent Heights Boulevard line, 8.75 miles of new coach route. There were 2.43 miles of extensions, making a total of route mileage increase for year a little more than 11 miles and total miles of route 65.

Five double-deck and twenty single-deck coaches were added to the service, making a total of 119 after deducting old equipment.

None of the above figures includes the Los Angeles Railway's interest in the Los Angeles Motor Coach Company.

During 1927 the new repair shops, a building more than 300 ft. long, of the most modern design, was completed. A new service station was also completed for filling coaches with gasoline.

A modern washing system has been installed and is nearly completed.

Plans have been drawn for a new motor coach division headquarters.

Accounting Classification for Wisconsin

Motor carriers there divided into two classes under new accounting plan. Digest of provisions of code

A UNIFORM classification of accounts for motor carriers has been prescribed by the Railroad Commission of Wisconsin effective on Jan. 1, 1928. For the purpose of the classification motor carriers are divided into two classes, A and B. Class A companies are those with operating revenues that exceed $100,000. In Class B are companies with annual operating revenues exceeding $15,000, but not more than $100,000, or those jointly operated in connection with a Class A or B utility as heretofore defined by the commission and having a revenue of less than $15,000 annually.

A uniform system is prescribed for all classes of companies, for balance sheet accounts, fixed capital accounts, income accounts, profit and loss accounts, and operating revenue accounts. In the case of operating expense accounts two groupings are prescribed. Class A companies are to keep 39 accounts and the smaller companies only 21 accounts.

Under this classification depreciation charges are considered a part of the general and miscellaneous group, but in making up the standard form of income statement, depreciation must be shown separately along with uncollectible bills and taxes assignable to operations. In other words, depreciation and taxes are treated as income deductions. Rents are likewise treated.

The grouping of the revenue and expense accounts follows closely the classification adopted by the National Association of Railroad & Utilities Commissioners and the American Electric Railway Accountants' Association. Mention should be made of the group entitled "garage operating expenses" which covers fuel, lubricants, garage employees, and garage supplies and expenses. Operating expenses lead off with the group of maintenance accounts, followed by garage operating expenses, transportation, traffic and general and miscellaneous. The revenue accounts correspond with those prescribed in other standard classifications both as to individual accounts and arrangement.

The arrangement of the balance sheet is new. Fixed capital accounts follow the arrangement of the standard classification except with regard to the method of handling "cost of property and equipment purchased," which is carried as a suspense account until such time as the cost is assignable to fixed capital accounts. Provision is also made for fixed capital accounts maintained prior to the time the new classification is put into effect.

Houston Line Will Be Continued

Because of protests from residents of Bellaire, Tex., the Houston Electric Company has decided to abandon its plan for withdrawing bus service from that territory. Plans to discontinue the service were based on insufficient returns and heavy expenses. The bus is operated by the Houston Electric Company through a contract with the Westmoreland Farms Company, which in turn had an agreement with Bellaire property owners.

Court Acts in Seattle-Tacoma Case

Differences between E. Krakenberger of Tacoma, Wash., and the Pacific Northwest Traction Company, a subsidiary of Puget Sound Power & Light Company, Seattle, Wash., over their respective rights to provide bus service have been carried into the State Department of Public Works and the Thurston County Superior Court.

Mr. Krakenberger has been granted permission by the Department to provide motor passenger and express service over the new Pacific Highway between Seattle and Everett. Similar permission was refused the electric interurban between Seattle and Everett, and Seattle and Tacoma. As a result, the railway secured from the Thurston County Superior Court a writ of review which takes precedence over the Department of Public Works' order denying the company's permission to operate stage service over the new highway. In granting the petition for review, Superior Judge John M. Wilson issued an order restraining Mr. Krakenberger from operating on the new route until litigation is closed. Mr. Krakenberger has also announced his intention of invading a new field and has applied for permission to give motor bus service on the new highway between Seattle and Tacoma.

Substitution on New Jersey Line

Permission has been granted to the Public Service Railway to discontinue railway service on its Broadway route south of Gloucester City, N. J., and the Public Service Transportation Company, its subsidiary, has been authorized by the commission to substitute bus service for trolleys between Camden and National Park and Woodbury and Blackwood.

Steam Railroad Secures Charter for Subsidiaries

Governor Fisher of Pennsylvania signed the charter of the Reading Transportation Company on Jan. 27. Stock control in the company is held by the Reading Company, which will own 1,965 of the 2,000 shares of common stock. Officers of the Reading Company are incorporators of the subsidiary. Previous approval had been obtained from the Public Service Commission before the Governor acted. The commission in its decision held that the Reading must secure sanctions for each separate bus route it plans to establish.

During the hearings before the Publis Service Commission the Schuylkill Railway and its bus subsidiary appeared as protestants. This company operates electric railways out of Pottsville, Pa., and vicinity. It contended that the Reading planned to invade its territory. After it had been overruled by the commission the electric railway appealed to the Superior Court. The case was dismissed. The Supreme Court then denied an appeal from the Superior Court decision. The steam railroad must still prove to the satisfaction of the Public Service Commission that public necessity and convenience require any service it may contemplate installing, so recourse is still open to the electric railway to protest any plans by the steam carrier for installing service which the electric railway might regard as competitive or unwarranted.

The first effort on the part of the Reading to get its subsidiary chartered in Pennsylvania was unsuccessful. Shortly before leaving office more than a year ago Gifford Pinchot, then Governor, declined to approve the charter. At that time the Pennsylvania Railroad had an application pending to organize a bus subsidiary with a capital stock of $500,000. Mr. Pinchot refused to approve the incorporation of both companies. The Pennsylvania Railroad was asking the right to run buses for freight and passenger service in 55 of the state's 67 counties.

Buses in Savannah Accommodate Steam Railroad Employees

A bus service to transport employees of the Atlantic Coast Line Railroad shuttle train operating between the yards on East Broad Street, and the shops at Southover Junction, Savannah, has been arranged with the Savannah Electric & Power Company. The new service is a substitution for the shuttle train discontinued. The contract made with the Savannah Electric & Power Company was let after bids had been received from a number of concerns.

The Savannah Electric & Power Company secured buses in this service. These are of the latest standard city car type, one having a seating capacity of 29 passengers, and the other 21 passengers. The larger bus is operated during the daylight hours, and the smaller bus during the night hours. The buses handle only employees of the Atlantic Coast Line Railroad. Due to the many employees at the shops one shuttle train will be operated in each direction in the morning and afternoon.

Several months ago the railroad announced that it had determined to withdraw the shuttle train as soon as definite arrangements could be made for the operation of a substitute service.

Extension of Bus Service in Jacksonville

Bus service to the residents of Murray Hill is to be given by the Jacksonville Traction Company, Jacksonville, Fla. Two buses will be used for the new line. This proposed service was referred to previously in ELECTRIC RAILWAY JOURNAL.

Bus Purchase in Ohio

The Cleveland-Akron-Canton Bus Company, a subsidiary of the Northern Ohio Power & Light Company, Akron, Ohio, has purchased the Blue Line Transit Company operating between Canton and Dover, Ohio. Equipment valued at approximately $25,000 is included in the deal.

New Schedule on Missouri Interurban

A new schedule which will cut down the number of buses operating between Excelsior Springs and Kansas City, Mo., is to be put into effect by the Kansas City, Clay County & St. Joseph Railway and bus companies. Under this plan Excelsior Springs will have hourly service to the city alternating between buses and the interurban line.

More Bus Feeders in Chicago

The Illinois Commerce Commission has ordered the Chicago Surface Lines to establish bus feeder service on Diversey Avenue from Milwaukee west to the city limits, and on Belmont from Central Avenue to the city limits.

The Surface Lines now operates a feeder bus line on Diversey Avenue from Crawford to Laramie, and the new order would extend this service east and west, connecting it with one of the important diagonal street car lines to the northwest.

A 7-cent fare is charged and transfers are granted between buses and street cars.

No action has been taken by the commission on the petition of 40,000 residents on Addison Street to have a feeder bus service established by the Surface Lines along that street.

During the week ended Jan. 28 Mayor William Hale Thompson vetoed the City Council's authorization of the establishment of this bus service on Addison Street.

Buses on First Street, San Diego

Buses are to be used by the San Diego Electric Railway, San Diego, Cal., to replace cars on the company's First Street line. Under the bus plans a 10-minute headway will be maintained between 6 a.m. and 7 p.m. as compared with 15 minutes headway on street cars. The line will operate as a unit of the railway system, with transfer privileges to every other line. G. E. Mason, general manager of the railway, is reported to have said:

The tracks and paving on First Street have been in poor condition for some time and, until recently, we had expected to replace the tracks and continue railway operation because of the large volume of passengers being handled on this line.

The standard type of bus was not considered suitable for this line. However, due to recent developments, a new aspect has occurred in transportation views and new possibilities have been opened up in bus operation through the adaption of larger capacity vehicles. After considerable investigation and actual operation of the newly-developed bus on our own property we have been convinced that this service will prove practical for use on the First Street line.

The bus is known as the twin coach. In appearance it is similar to a street car. It has a seating capacity of 40 passengers and is provided with front and rear large doors so passengers can get on and off with a minimum of delay, as contrasted with the use of the small single door on the average bus. It is driven by two engines, both underneath the floor and in the center of each side. Thus the whole street space occupied by the bus is utilized for passenger carrying and is much more efficient and causes much less congestion than the older types of buses with their large projecting hoods and fenders.

We believe the residents along the First Street line will welcome the change from street cars to this new and delightful type of equipment drawing up to the curb, as it does, to receive and discharge its passengers and for the further fact that, under bus operation, we will be able to provide much closer headway, that is, much more frequent service because of the flexibility of the new equipment.

Another Way to Relieve Traffic in South Bend

Permission to operate a supplemental motor freight service within South Bend was granted the Chicago, South Shore & South Bend Railroad by the Indiana Public Service Commission. Freight now is transferred between two freight terminals of the road by freight cars, and the institution of a motor truck and trailer service will help to relieve congested traffic conditions.

Bus Extension in Quincy

The Quincy Street Railway, Quincy, Ill., is preparing to supplant its present North Fifth Street line with buses on the completion of the repaving of that district. Five additional buses are included in the 1928 budget of the company anticipating and providing for this extension of the motor service, making a total of 20 buses in operation in the city.

Financial and Corporate

New Jersey Details Arranged

Public Service Co-ordinated Transport begins to function as consolidation of railway and bus companies

PUBLIC Service Co-ordinated Transport—a new company formed by the consolidation of Public Service Railway and Public Service Transportation Company, Newark, N. J.—was created on Jan. 31 when the certificate of organization was filed with the Secretary of State at Trenton. Earlier in the day the stockholders of the two companies adopted the agreement of merger, submitted to them by the directors of both companies.

The main purpose of the consolidation is the co-ordination into one operating unit of the two companies which have heretofore operated the railways and buses. Instead of dividing the responsibility between two companies, the one company will hereafter operate both services, with the object of effecting greater economies and efficiency, redounding to the advantage of the public as well as to the stock and bondholders.

The consolidation will also bring an improvement in financial structure, including the possibility of an open-end mortgage making it easier to secure new capital for extension and betterment of facilities. As Thomas N. McCarter, president, pointed out when the first announcement of the proposed merger was made, the benefits of this character of consolidation have been demonstrated in the merger of the electric and gas companies into Public Service Electric & Gas Company in 1924.

The certificate of organization specifically states that the new corporation "shall have and possess, and may use, exercise and enjoy all the rights, powers, privileges and franchises of the said corporations, parties to this agreement."

Furthermore, that: "All and singular, the rights, privileges, powers, stock, property, whether real, personal or mixed, railways and franchises of each of the parties thereto, shall vest in the co-ordinated corporation immediately upon the adoption of this agreement by the stockholders of the said corporations, according to law, and the filing of this certificate, or a copy thereof, with the secretary of state."

It is also provided that the new corporation "may issue its stock, common and preferred, may make, issue and dispose of bonds or other obligations in order to carry out the purposes of the consolidation; to pay and discharge bonds, mortgages and encumbrances upon any of the property of the consolidated companies."

The financial procedure involved in the consolidation is, briefly, as follows:

Provision is made for the issuing of 2,500,000 shares of no par value common stock and 487,500 shares of non-cumulative preferred stock of no par value. Preferred stock will have no voting rights but will receive dividends at the rate of $6 per annum per share, for such years as in the judgment of the board of directors such dividend is justified and before dividends are paid on common stock. In the event of the dissolution of the company its preferred stock shall be entiled to a division of the assets at the rate of $75 a share, before the common stock receives any part of the assets.

Under the terms of the agreement the 487,500 shares of no par value common stock of Public Service Railway outstanding will be exchanged for 487,500 shares of non-cumulative preferred stock of Public Service Co-ordinated Transport, and the 1,004,500 shares of common stock of Public Service Transportation Company outstanding for the same number of shares of common stock of the company.

Directors and officers of the new corporation follow: Directors, Thomas N. McCarter, Samuel T. Bodine, Thomas S. Gates, Anthony R. Kuser, Alfred L. Loomis, Uzal H. McCarter, Arthur W. Thompson, Landon K. Thorne, Edmund W. Wakelee and Percy S. Young.

Officers, Thomas N. McCarter, president; Percy S. Young, Edmund W. Wakelee, John L. O'Toole, George Barker, Matthew R. Boylan, vice-presidents; Charles M. Breder, secretary; William H. Feller and William T. Crudge, assistant secretaries; T. W. Van Middlesworth, treasurer; Frederick A. Neis, Robert S. Tomkins and F. Milton Ludlow, assistant treasurers.

These men have occupied similar positions with the two merged companies.

Grand Rapids Gross Increases

Economy and modernization methods of Grand Rapids Railroad result in reasonably satisfactory position for 1927 operation

THE number of revenue passengers carried on the lines of the Grand Rapids Railroad, Grand Rapids, Mich., during 1927 decreased 5.96 per cent below 1926. Gross earnings naturally were affected and decreased $95,595, compared with those of the preceding year. These decreases were due principally to an unexpected slowing down of manufacturing activities in the city's largest industry, namely, furniture making. This condition operated to the detriment of street car patronage but owing to the steps taken by the management in installing a new type of car on various lines, the savings realized from lower operating costs more than offset the decline in gross earnings. As a result, gross income after operating expenses and taxes for the year 1927 showed an increase of $20,262 over 1926. This was part of the story of the year's operation as disclosed in the report to the stockholders for the eight months ended Dec. 31, 1927. The board of directors submitted the eight months' statement and one for the calendar years 1926 and 1927, of which 1926 and the first four months of 1927 cover operations by the predecessor.

In accordance with the plan of reorganization of the Grand Rapids Railway dated April 11, 1927, the present company was incorporated under the laws of Michigan on April 15, 1927, and as of May 1, 1927, acquired all of the assets and assumed all of the indebtedness of the former company, including its outstanding bonds. A total of $146,800 in par value of 7 per cent preferred stock (out of an authorization of $300,000) and all authorized common stock consisting of 100,000 shares without par value were issued. The outstanding debenture bonds were reduced by $355,000 and the entire

GRAND RAPIDS STATEMENT FROM MAY 1, 1927, TO DEC. 31, 1927

Gross Earnings:	
Passenger revenue	$1,034,243
Revenue from special cars	1,477

Digitized by Google

floating indebtedness aggregating $606,333 was provided for. In addition to the cash realized as a result of the plan, $200,000 in principal amount of first mortgage sinking fund 7 per cent bonds due May 1, 1939, were sold, so that the net reduction in the total bonded debt was $155,000.

An initial quarterly dividend of 1¾ per cent was paid on the 7 per cent preferred stock (all of which was subscribed for by preferred stockholders of the old company) on Aug. 1, 1927, and quarterly dividend No. 2 was paid on Nov. 1, 1927.

No change was made in the rates of fare in effect during 1927, namely, 10 cents single cash fare, and six tickets for 50 cents. According to the terms of the franchise, the company is entitled to earn at these rates a return of 7¾ per cent on the value of the property after deduction of operating expenses, taxes and provision for retirement reserve.

A total of $95,303 was expended during 1927 for additions and betterments. The larger portion of these expenditures was for the purchase of 10 second-hand Birney single-truck, one-man operated safety cars and remodeling them in conformity with the standard Grand Rapids type of cars.

Bus service is rendered as supplemental to and in co-ordination with that rendered the public by the street railway system. It is intended to extend bus service to territory not now served by street cars, whenever conditions so justify.

Steps taken in conjunction with other organizations in the city to promote public safety work bore favorable results in 1927. The expenditures for injuries and damages in 1927 amounted to only 1.11 per cent of the transportation revenue. The continued use of loading platforms and safety zones has been beneficial and together with the safety campaign conducted has reduced the number of avoidable accidents between automobiles and street cars.

Mention is made in the report of the distinction conferred upon the company by the Charles A. Coffin Award for the year 1927.

Would Lease Three Illinois Electric Railways

The Illinois Terminal Corporation applied to the Interstate Commerce Commission on Feb. 2 for permission to take long-term leases on three electric lines in that state. It proposes to operate the St. Louis, Troy & Eastern, the St. Louis Electric Terminal Railway and part of the main line of the Illinois Traction, Inc. The first two corporations control much shorter roads than Illinois Traction. Increased efficiency in operation and elimination of duplication in service and terminals were said to be the reasons for the proposed consolidation. All of the leases would run for 99 years with rental rates based on the amount of property involved.

Receivership Ahead in Tacoma

Petition expected to be filed with court soon. Scott Z. Henderson suggested for place

PETITION for a receiver is expected to be filed in the federal court in Tacoma early in February by bondholders of the Tacoma Railway & Power Company, Tacoma, Wash. Representatives of the creditors met on Jan. 24 in New York, with Mayor Tennant and Scott Henderson attending, and unanimously decided to apply for receivership. This action has not been unexpected, as negotiations between the City Council and railway officials had come to a point where it seemed a revaluation of the railway properties was inevitable. The company management had been asked to determine whether the bondholders and stockholders would agree to a valuation of $3,000,000 for rate-making purposes instead of the $6,700,000 approximately allowed by the state.

Puget Sound Railway Also Involved

Moreover, the fact that the Tacoma companies defaulted in their last interest payments on bonds and may do so again this spring indicated probable receivership. The Puget Sound Electric Railway, which by ownership of $600,000 of common stock of the Tacoma Railway & Power Company is the controlling interest, also is reported in financial straits. That company has announced that it will no longer advance sums to meet interest payments for the Tacoma company. The Puget Sound Electric Company, operating an interurban line between Tacoma and Seattle, is in turn a subsidiary of the Puget Sound Power & Light Company, under Stone & Webster direction.

Statement in Behalf of Company

Meanwhile, Richard T. Sullivan, manager of the company at Tacoma, in a bulletin to all employees indicates that he expects little if any change in the operation of the lines, and declares there will be no interruption of the orderly operation of the transportation system. The schedule of fares now in effect has been authorized by the State Department of Public Works until the last of May.

Mayor Tennant, in a telegram from New York to the Council, looks upon the receivership as a means of obtaining an orderly settlement of the Tacoma transportation problem. His telegram is as follows:

> In meeting with a committee representing the creditors of the Tacoma Railway & Power Company at the Pennsylvania Hotel, New York, it was decided that in the best interests of all parties concerned an immediate receivership of the company should be petitioned for under federal court jurisdiction.
>
> It was also unanimously agreed to recommend to the court at the proper time that Attorney Scott Z. Henderson be appointed as receiver.
>
> In my opinion, with the hearty co-operation which I am sure the citizens of Tacoma are ready to give the course outlined, this offers a prompt and orderly solution of our entanglements which have hampered and embarrassed us in the past.
>
> Therefore, I am authorized to inform the citizens of Tacoma of this contemplated act.

Lynchburg and Roanoke Properties Sold

Confusion caused by newspaper announcements is cleared up by an official statement from George N. Tidd, president of the American Gas & Electric Company, that, while retaining the electric light and power business in Roanoke and Lynchburg, Va., and the Lynchburg gas plant, which have for some time been operated by the Appalachian Electric Power Company, the American Gas & Electric has sold the Roanoke Railway & Electric Company, the Roanoke Traction & Light Company and the Lynchburg Traction & Light Company, operating electric railway lines and bus lines.

The new owners are the Central Public Service Company, Chicago, which also recently purchased the Rockford Electric Company and railway and bus lines in Wildwood, N. J., Huntington, W. Va., Ashland, Ky., Portsmouth, Ohio, and Ironton, Ohio, from the American Gas & Electric Company.

Franchise of Pennsylvania Property to Be Sold

The corporate franchise of the Pennsylvania & Maryland Street Railway, operating from Salisbury to Meyersdale, a distance of 7 miles, will be offered for public sale through Receiver H. S. Wilhelm, at the courthouse in Seneca, Pa., on Feb. 4. This is in pursuance of the decree of the Court of Common Pleas. The sale is for the purpose of divesting a mortgage given by the railway to the Farmer's Loan & Trust Company, New York.

In 1924 the company abandoned the 5-mile line between Meyersdale and Garrett, Pa. Some months ago the franchise became the property of the Associated Gas & Electric Company by virtue of the acquisition of the Meyersdale Electric Light Company of Meyersdale.

Baltimore Easements Valued at $5,000,000

A valuation of $5,000,000 was placed upon the easements of the United Railways & Electric Company, Baltimore, Md., by the Maryland Public Service Commission on Feb. 1. The previous figure fixed by the commission was $7,000,000. The latest decision, therefore, finds the total value of all property of the company, including easements, to be $75,000,000 as of Dec. 31, 1923.

An order was passed by the commission stating that the fair value for rate-making purposes of the United property on Dec. 31, 1923, was $75,000,000 and this valuation shall become final

Digitized by Google

unless protest is filed within ten days. The remainder of the order passed by the commission on March 9, 1926, is unchanged.

The controversy over the value of the easements came up in 1926 when the commission fixed the valuation at $7,000,000. At that time the United claimed a value of $18,184,954. Clarence W. Miles, then People's Counsel, contended that no value whatever should be placed on the easements. When the $7,000,000 value was placed he appealed to the courts and the commission was upheld in a decision handed down by the Circuit Court of Baltimore City. Mr. Miles then carried the case to the Court of Appeals of Maryland. The appeal resulted in the court handing down a decision sustaining the principle of allowing a value for easements but holding that in using assessment values for fixing the value of the easements the commission actually had used values which contained the element of earning power. The court remanded the case, without affirmance or reversal of the decree, for further proceedings. An agreement followed by which the case was returned to the commission for rehearing. This latest action then followed.

Would Abandon Ohio Line

The Northern Ohio Power & Light Company, Akron, Ohio, has applied to the Ohio Public Utilities Commission for the permission to abandon its line and remove its tracks between Canton and North Canton, a distance of 6 miles. It has also filed application for abandonment of service between North Canton and Akron. Hearing has been set for March 13. The Cleveland-Akron-Canton Bus Company, a subsidiary of the Northern Ohio Power & Light Company, is now operating buses over the highway between Akron and Canton.

Seven reasons are named in the application to the commission. They are:

1. Operation of the line has been unprofitable for several years, and losses are increasing.
2. The Akron-Canton highway is to be paved to nearly its full width, necessitating removal of the tracks.
3. The company has been requested by the Commissioners of Stark County to get off of the highway.
4. The County Commissioners and the company have been unable to agree on new franchise terms.
5. All franchises for the operation of the line have expired.
6. Other transportation along the route is adequate, and maintenance of the line is not needed for the public's necessity and convenience.
7. Facilities for hauling freight between the two cities have been arranged.

Removal of this branch of the company's interurban line will not affect service on any other part of the system. For many years the company has maintained an hourly schedule between Akron and Canton. The Akron-Canton line has been operating for approximately 25 years.

Surplus in Cleveland Subject to Tax

Decision rendered by United States Board of Tax Appeals will be carried to courts

Surplus earnings of a public utility, though accumulated for the sole purpose of making possible a reduction in rates, are subject to federal income and excess profits taxes. The United States Board of Tax Appeals has so ruled in a case appealed by the Cleveland Railway. By a twelve to four decision, the board held that the railway must pay $470,000 additional taxes for the years 1918 to 1921 inclusive.

An appeal will be taken to the United States Circuit Court of Appeals, according to Joseph H. Alexander, president of the company. The law department of the city of Cleveland, which joined in the hearing before the tax appeal board, will join in the appeal to the courts. The case may reach the United States Supreme Court on constitutional questions.

The dispute arose from the unusual provisions of the Tayler franchise, under which the Cleveland Railway operates. Under the terms of this franchise stockholders are guaranteed a 6 per cent return and surplus earnings above the amount needed to meet this charge are used to provide a barometer fund under which fares are varied in accordance with the amount in the fund. Thus when the fund goes below $500,000 the fare automatically goes up, and when the fund goes above $1,100,000 the fare automatically goes down.

The company contended that the money put into the interest fund was not subject to taxation, because the car-riders of the city, upon whom the burden ultimately falls, are in fact a political subdivision under the meaning of the revenue law and therefore entitled to relief from that burden.

The majority opinion of the board, written by Chairman Benjamin H. Littleton, stated that while it is undoubtedly true that the levying of the tax in question will impose a burden upon the petitioner, which in turn will mean a burden to the car-riders, this is not a burden upon a political subdivision within the meaning of the law. The opinion said:

> The burden is not on the city of Cleveland as such. No income is derived by it from the operations of the petitioner, nor is it required to pay any of the petitioner's expenses, be they taxes or otherwise. The car-riders of the city of Cleveland and its suburbs are in no sense a political subdivision, but are merely members of a community, or of several communities, which use the transportation facilities of the petitioner. The burden would indirectly fall upon them in their individual capacities, but not upon a political unit or subdivision in its sovereign or governmental capacity.
>
> To carry the petitioner's argument to its logical conclusion would mean to exempt the petitioner from all tax, since to levy any tax on this corporation would be to increase the cost of transportation, which in turn means increased car fares and, therefore, imposes a burden on the community of car-riders to that extent.

A dissenting opinion was prepared by Examiner William R. Green, Jr., before whom the original arguments in the case were submitted. Mr. Green pointed out that receipts accumulating in the interest fund are not subject to the will of the corporation, that they may not be distributed and that their use is limited by provisions of the Tayler franchise. He added:

> In them the petitioner has nothing definite, nothing tangible, nothing usable in the way of income. Their accumulation is a matter of no interest to the petitioner because no advantage is gained thereby. No gain or profit results from such an accumulation and it lacks several of the essentials of true income under the sixteenth amendment.

City's Engineers Fix St. Paul Value at $14,865,180

Averaging three separate and varying findings by three civil engineers employed by the City of St. Paul, Minn., it is estimated by Corporation Counsel A. A. Stewart that the present value of the St. Paul City Railway is $14,865,180, with 20 per cent depreciation. This is to be the contention by the city in the forthcoming hearing of the railway before the Minnesota Railroad and Warehouse Commission for an increase in fare. The company's own estimate is $16,503,557. The commission's valuation finding four years ago on an 87 per cent basis was $16,196,090.

Each engineer presented two sets of figures—one the depreciated condition of the property without allowance for any except physical wear, the other making some allowance for obsolesence for track where changes in street structure will require its removal.

To the report of the engineers was added three additional items set up by the commission: $1,000,000 going concern value, $100,000 working capital and $870,513 land values. Mr. Stewart said:

> These figures will of course be disputed by the company's engineers, but assuming that they are adopted by the commission a 7 per cent return would require that the company earn over and above its operating expenses $1,500,000 a year. The company last year fell short of this more than $300,000. It earned not quite 5 per cent on a $15,000,000 value.
>
> If the relief suggested in the charter amendment is granted the earnings of the company would be approximately 6 per cent on $15,000,000. The earnings of the Minneapolis company amount to approximately 7 per cent on the commission's value without any additional depreciation since 1924.
>
> Even if the commission should adopt the city's present contention as to the depreciation value of the property it will be necessary to grant the relief proposed by the charter amendment in order to bring the earning capacity of the St. Paul company up near the earning capacity of the Minneapolis company.

The city engineer experts are W. L. Darling, formerly chief engineer Northern Pacific Railroad; Max Toltz and L. P. Woolf.

Legal Notes

IOWA—*City Not Responsible to Street Railway for Expenses in Change of Grade.*

A statute in Iowa says that when any city or town changes the grade of any street, so as to injure the value of any improvement made by any person on the street, according to the previously established grade, the city shall pay to the owner of the property so injured the amount of the damages inflicted. This was held not to cover a street railway on the street, which was obliged itself to defray the cost of the necessary alterations to its double track on a street whose grade was changed by the city. [Des Moines City Railway vs. City of Des Moines, 216 N.W., 285.]

MASSACHUSETTS.—*Boston Elevated Bill Declared Constitutional.*

In two opinions the Supreme Judicial Court answered eleven questions propounded by the State Senate and 24 questions by the House of Representatives relating to the constitutionality of a bill extending the lease to the Commonwealth of the properties of the Boston Elevated Railway and continuing public management and operation. An extended abstract of these opinions was published on page 998 of the issue of ELECTRIC RAILWAY JOURNAL for Nov. 26, 1927. [In re opinion of the Justices, 159 N.E., 55 and 70.]

MISSOURI — *Court Defines Care Required of Automobilists at Railroad Crossings.*

In a crossing accident, even where the steam railroad train did not give the statutory signals, the railway may offer contributory negligence as a defense to show that the failure to give the signals did not cause the injury. A railroad is a signal of danger, and if to look or listen will enable one approaching a railroad track to see or hear an approaching train, failure to look or listen is negligence as a matter of law. An automobilist in approaching a crossing should operate his car at such a rate of speed that he can readily stop after reaching a point where he can see an oncoming train and before coming within the danger zone. If objects obstruct his view or noise interferes with his hearing, his conduct must meet these conditions. Otherwise he is negligent. [Maclay vs. M. P. Ry., 299 S. W., 626.]

NEW HAMPSHIRE—*No Warning Necessary to Passenger Leaving Moving Car.*

The conductor on an open car is under no duty to warn a passenger leaving it before it stops of possible irregularity of movement in stopping, since passengers are assumed to have general knowledge of the danger of leaving a moving car. Where a passenger knows the danger of the situation and is able to avoid it, the carrier is not held to so high a standard of care as that which it must use to protect passengers from dangers of which they are ignorant and cannot themselves avoid. [Wright vs. B. & M. R.R., 139 A., 370.]

NEW JERSEY—*Passenger Injured While Closing a Broken Window.*

A passenger was injured by being cut by glass falling from the window when he was attempting to close it. The glass in the window was cracked before the attempt was made. The court held that he was not contributorily negligent *per se* in not calling the motorman of the one-man car to close the window, even though he had already observed that the window glass was cracked. [Russell vs. P. S. R. Co., 139 A., 322.]

NEW YORK—*City Requiring Relocation of Poles for Construction of Its Railroad Must Compensate Electric Company.*

In the construction of an elevated portion of the New York Rapid Transit System, the City of New York acted in a proprietory and not in a governmental capacity. Hence, it was required to compensate an electric company for the expense to which it went in removing and relocating its poles and lines caused solely because they would interfere with the construction and operation of the railroad. Such poles and lines constituted property of which the electric company could not be deprived without just compensation. If the removal and relocation had been necessitated by a regrading of the street or any other purpose necessary for the usual use of the street by the public for public street purposes, the cost of the change would have had to have been borne by the electric company. [N. Y. & Q. E. L. & P. Co. vs. City of New York, 224, N. Y. Sup., 564.]

OHIO—*Certificate for Extension of Bus Line Should Not Be Allowed Where the Extension Overlaps an Existing Route.*

Two bus companies operating in uncompeting territories petitioned for extensions. These extensions, if granted, would overlap each other and one would overlap part of the existing line of the other. The Supreme Court of Ohio held that where each applicant was prepared to meet all the requirements essential in a proposed service the opinion of the Commission should be accepted as to the one to be the grantee. However, it notified the Commission to shorten the extension requested by the grantee so that it would not overlap the existing line of the other company. [Cooper Bus Co. vs. P. U. Commission of Ohio, 158, N.E., 543.]

PENNSYLVANIA — *Responsibility for Defective Paving Placed.*

Even in the absence of a contract, a street railway company is under the implied duty to keep in proper repair the portions of a highway occupied by its tracks. A person injured because of a defect in this paving may sue either the municipality or the street railway company. If he chooses the latter, the one ultimately liable, and fails to recover, he cannot later sue the municipality for the identical negligence. [Brobston vs. Borough of Darby, 138 At., 849.]

TEXAS — *Damages to Property From the Construction and Operation of Railway.*

Damages for depreciation of the value of a homestead, caused by the construction and operation of a railroad in close proximity to it, not common to the public generally, are recoverable. This principle, long recognized by the Texas courts, was held to apply to property in close proximity to a trestle built by an interurban railway, as it was claimed that the value of the property was depreciated by the noise and vibration caused by passing trains. [Texas Interurban Ry. vs. Halford, 299 S.W., 277.]

WEST VIRGINIA — *Court May Award Certificate to Motor Carrier Without Referring Cases Back to Commission.*

Two independent motor carriers applied for certificates of convenience and necessity between certain points. One of these applications was opposed by an electric railway company serving the same general territory which offered to install a bus extension to give the same service. The other certificate was similarly opposed by an existing steam railroad, offering through its bus subsidiary to give the service proposed between those two cities. Award of certificates by the State Railroad Commission to the independent bus companies was set aside by the Court in favor of the subsidiaries of the steam and electric railroads on the ground that the public policy of the state, as expressed in legislative enactments, requires that public utilities be given reasonable protection from detrimental competition. Therefore, when an existing carrier is one of several applicants for the initial permit to operate motor buses over a highway between points served by its lines, and it is fully qualified to render the additional service proposed, the State Road Commission should ordinarily give preference to the carrier. Priority of time and application, while an element to be considered, is not ordinarily of sufficient importance to control the granting of a certificate. [Monongahela W.P. P. S. Co. et al. vs. State Road Commission et al., also B. & O. R.R. et al. vs. same, 139 S.E., 744 (two cases).]

Personal Items

F. J. Foote President C.E.R.M.M.A.

F. J. Foote, recently elected president of the Central Electric Railway Master Mechanics' Association, is superintendent of power and equipment of the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio. In his present capacity he is responsible for the maintenance of the cars, shops and substations of that company, and the buses of the Dayton & Columbus Transportation Company, which is affiliated with the electric railway.

Mr. Foote has been identified with the property that centers in the city of Springfield since 1909. Previous to his affiliation with the company, then known as the Ohio Electric Railway, he was employed as electrical engineer by the Allis-Chalmers Company, Milwaukee, Wis., and the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.

F. J. Foote

Mr. Foote is a graduate of the University of Illinois and did post-graduate work at the University of Wisconsin. In the latter institution the degree of electrical engineer was conferred on him in 1902.

The association of which he has recently been elected president is composed of the mechanical department officers or the men responsible for maintenance of rolling stock and shops of the various companies who are members of the Central Electric Railway Association. He was one of a small group of men who organized the association of which he is now the head.

P. J. Raver Goes to University

Paul J. Raver, estimating engineer for the Chicago Surface Lines, Chicago, Ill., has joined the staff of the Institute for Research in Land Economics and Public Utilities of Northwestern University, Evanston, Ill. This was announced by Dr. Richard T. Ely, director of the institute. Mr. Raver also becomes a lecturer in the public utility courses in the school of commerce of Northwestern.

Mr. Raver's practical experience began in the engineering, accounting, and transportation departments of the Lincoln Traction Company, Lincoln, Neb. During the valuation of that property in 1919, he joined the staff of Hagenah & Erickson, engineers and appraisers in Chicago, where he was in charge of the valuation of the Central Illinois Light Company of Peoria, the Central Illinois Public Service Company properties and other public utilities. In 1922, he was made engineer of estimates for the Chicago Surface Lines.

The school of commerce of Northwestern University granted him the degree of master of business administration in June, 1927, for graduate studies carried on during the preceding three years. Mr. Raver obtained his bachelor's degree in engineering at the University of Nebraska in 1917.

E. C. Bassett Appointed General Passenger Agent at Buffalo

Earl C. Bassett, traveling passenger agent has been appointed general passenger agent for the International Railway and International Bus Corporation, Buffalo, N. Y. Mr. Bassett succeeds J. E. Wilmot, recently promoted to passenger traffic manager.

Mr. Bassett was engaged in railroad work with the Erie Railroad before going to Buffalo.

J. K. Choate Resigns from J. G. White Management

Joseph K. Choate has resigned as director and vice-president of the J. G. White Management Corporation, New York, effective March 31.

N. E. Drexler Succeeds C. D. Porter at Newport News

Norman E. Drexler has been named acting manager of the Newport News & Hampton Railway, Gas & Electric Company, Newport News, Va., succeeding C. D. Porter, who resigned as vice-president and general manager to accept a similar position with the Omaha & Council Bluffs Street Railway, Omaha, Neb. Mr. Drexler has been manager of the gas and electric departments of the company since 1925.

Since Mr. Drexler's graduation from college he has been with the Newport News & Hampton Railway, Gas & Electric Company. He served as assistant engineer, master mechanic, assistant chief engineer and assistant superintendent of transportation. In 1916 he was acting chief engineer of the Baltimore & Annapolis Short Line Railway and after that became chief engineer of the Newport News & Hampton Railway, Gas & Electric Company.

Mr. Drexler's construction activities included the tracks, bridges and overhead of the Hampton & Langley Field Railway and the Hilton extension of the Newport News & Hampton Railway. Mr. Drexler was born in Green Island, N. Y., in 1891. He was educated in the grammar schools of Troy and at the Troy Academy. He received the degree of C.E. from the Rensselear Polytechnic Institute, 1912.

A. R. Williams New General Manager in Providence

Alonzo R. Williams, counsel for the United Electric Railways, Providence R. I., has been appointed general manager of the company, succeeding Edgar J. Dickson, who resigned a few months ago. As general manager, Mr. Williams will be responsible for the transportation department, and also all details on transportation and public relations that come before state, county and city authorities and civic organizations.

A. R. Williams

Mr. Williams has been connected with the law department of the company and its predecessor, the Rhode Island Company, since 1902. He was closely associated with the late Henry Hayes, Lefferts Hoffman and Frank T. Easton in handling legal affairs for that company. For more than 25 years he has represented the Rhode Island Company and the United Electric Railways in actions at law in both State and Federal courts.

A direct descendant of the founder of the State of Rhode Island, Mr. Williams was born in Providence on Oct. 20, 1877, the son of the late Alonzo Williams, for many years a professor at Brown University. He received his early education in the public schools of Providence. He is a graduate of Brown University. He also studied in Germany, France and Italy and at Harvard Law School. Leaving Harvard, he entered the practice of law.

Mr. Williams enlisted in the Rhode Island Militia in 1897 and was retired after 27 years with the rank of colonel, by act of the General Assembly.

Digitized by Google

Mr. Williams recently announced that he was a candidate for a Superior Court judgeship which it is expected the Legislature will create at its present session. Following his promotion by the United Electric Railways, he said he would continue his candidacy. In taking up his new duties he made an appeal for co-operation of the company's patrons.

No Change in New Jersey Officers Under Consolidation

Matthew R. Boylan, vice-president in charge of operation of both the Public Service Railway and the Public Service Transportation Company, Newark, N. J., will retain for the new consolidated company, Public Service Co-ordinated Transport, the same staff as presided over the various branches of the two merged companies, which includes: Arthur T. Warner, general manager in charge of traffic; Martin Schreiber, general manager in charge of plant; Louis P. Baurhenn, director of personnel; Edward A. Tuson, general auditor.

The division managers will assume similar duties in the new company, namely, James M. Symington, Essex; William H. Shepherd, Hudson; Joseph C. Rutledge, Passaic; J. Walter Wright, Bergen; Philip F. Maguire, Central; George A. Rothery, Southern.

J. E. Wilmot Becomes Buffalo Passenger Traffic Manager

President Yungbluth of the International Railway, Buffalo, N. Y., announced the appointment of J. E. Wilmot on Jan. 28 as passenger traffic manager for the International Railway and International Bus Corporation of Buffalo, N. Y. Mr. Wilmot, formerly general traffic solicitor, succeds Clarence E. Mitten, who leaves for Philadelphia, where he will take charge of the new business department of the Philadelphia Rapid Transit Company and associated companies.

Mr. Wilmot is a native of New York City. He is well-known in Buffalo and vicinity through his former connection with the Western New York Motorbus Lines and the Rochester-Buffalo Motorbus Line. Previous to his going to the International Railway he had five years' experience with the White and three years' with the Mack companies, makers of buses and trucks. For the past year he has been engaged as general traffic solicitor, with headquarters at Niagara Falls.

H. P. Lesswing Heads Buffalo Co-operative Association

Harold P. Lesswing, an electrician, has been elected president of the International Railway Co-operative Association, representing the 3,000 employees of the company in Buffalo and western New York. He succeeds William E. Murphy.

Maxwell H. Sherman, operator on the Broadway division of the local lines in Buffalo, was elected vice-president of the organization.

Kentucky Association Elects Samuel Riddle

The latest honor for Samuel Riddle, vice-president of the Louisville Railway, Louisville, Ky., is his election as president of the Kentucky Association of Public Utilities. This distinction was conferred upon him at the final session of the convention of that body on Jan. 19. Mr. Riddle is well-known in Louisville and in transportation circles throughout the country. He has been associated with the Kentucky property since 1910 when he became superintendent of transportation. Some years later he was made vice-president

Samuel Riddle

and when duties were realigned in 1925 he continued in that capacity.

Mr. Riddle was identified with many railway properties before his connection with the Louisville Company. In 1903 he was in charge of the erection of buildings and installation of equipment for the Connecticut Railway & Light Company. Later he was connected with the Rhode Island Company, the Chicago, South Bend & Northern Indiana Railway and the Philadelphia Rapid Transit Company.

Mr. Riddle was graduated from Swarthmore College, Pennsylvania, in 1897 with the degree of bachelor of science and engineering. In the fall of that year he became associated with Dr. W. A. Drysdale, consulting and mechanical engineer, Philadelphia. He continued in that capacity for five years. Later he went with the engineering department of the United Gas Improvement Company, Philadelphia. All these facts and others have been told from time to time in the pages of ELECTRIC RAILWAY JOURNAL. By now everybody knows "Sam" Riddle, who has been identified with many activities in the city of Louisville, including the Louisville Board of Trade, Rotary Club and Engineers and Architects' Club.

America Seen Through Foreign Eyes

Australian official thinks maintenance better abroad than here. Many trolley cars out of date

F. N. MACLEAN, chief draftsman chief electrical engineers' branch, New South Wales Government Railways and Tramways, Sydney, Australia, spent several days in New York during the week ended Jan. 21 upon his arrival from Europe, where he has been studying local transportation in the principal cities of Great Britain and on the continent. He left Sydney last summer in company with W. L. Ada, power superintendent of the same company, and has visited the larger cities in the United States, Canada, Great Britain, France and Germany. Mr. Ada met with an accident in London and was forced to return home from there, but Mr. MacLean came back to the United States and will sail for Sydney from Vancouver about Feb. 8.

One of the objects of the trip was to study the latest developments in car design. In Sydney, due to the temperate climate, cars are of the cross-bench type with a large number of doors on the sides. Mr. MacLean believes that type of car for the present conditions makes it possible to load and unload passengers in a minimum of time. He doubts that it would be possible at present to go to the American type of car either of the center entrance or end entrance types. He stated, however, that the problem at Sydney was changing due to the advent of the rapid transit system and also to the ever-increasing vehicular traffic, and that at some time in the future it may be necessary to use a different type of car. In this event he prefers the American practice rather than the European. He does not favor the double-deck car for the system with which he is connected.

Mr. MacLean was very much interested in the methods of loading cars and handling passengers in the United States, and in the traffic congestion problems here. He feels that when the parking problem in this country has been solved, the United States will have gone a long way toward solving the traffic congestion situation. He also believes it may be necessary to resort to the segregation of various kinds of vehicular traffic in order to obtain the most efficient use of the streets.

Upon his return to America after his visit in Europe, Mr. MacLean came to the conclusion that both equipment and track are far better maintained abroad than here. He believes that in this country there is considerable opportunity for the improvement of track conditions.

As for cars, Mr. MacLean feels that noteworthy improvements have been made in this country for the comfort and convenience of passengers, but is impressed with the fact that too many old cars are being operated. They do not correspond favorably in appearance with the modern motor buses or cars.

Manufactures and the Markets

Upward Trend in North Central and Mountain States

Business and industry in the North Central States entered the new year with a rather optimistic outlook. December witnessed subnormal rates of operations in some of the basic industries, but many of these industries reported that new orders for future delivery had improved materially. The iron and steel industry is on the upward trend, and operations in the motor car manufacturing plants is distinctly upward. 1928 should be a record year in the production of new automobiles and trucks.

Coal output in the section continues to be restricted, but general construction continues on a high scale and gives every indication of improving. High stock prices have compensated very largely for the decline in grain prices from last summer. The first week of the new year witnessed an increase in bank clearings of about 13 per cent over the first week in January, 1927. The underlying trend and sentiment are distinctly upward.

The year closed with business conditions in the Mountain States materially upward, volume of trade higher, flour mills and sugar refineries busy, copper output increased, crops and prices favorable, and livestock conditions excellent, and the coal strikers returning to work. Manufacturing, however, was generally quiet, coal production curtailed by strike, building quiet, and some labor surplus. The year ended, as a whole, on a favorable plane. A distinct feeling of optimism prevails in the Mountain States as the year opens.

Economic Currents of United States to Be Studied

A committee of leading business men and economists whose names will be announced later has been appointed by Secretary Hoover to supervise a far reaching inquiry into the changes in economic currents in the country, according to the Department of Commerce. Private individuals have subscribed the necessary money to enable the committee to pay the expenses of the Bureau of Economic Research of New York, to make the fact-finding background, and the co-operation of the Department of Commerce will be given.

It is proposed to determine facts with regard to such questions as the shifts in employment, changes in methods of production in industry and agriculture, and in distribution, shifts in relative price levels and profits, movements in the business cycle, shifts in standards of living, foreign trade and foreign credits, and other allied subjects which bear upon an understanding of the general business situation of the country. It is expected that the inquiry will take some months and will be made of most exhaustive order.

Resolutions on Outside Exhibits Adopted

The executive committee of the American Electric Railway Association at its meeting held in Cincinnati, Ohio, on Jan. 27 passed the following resolutions in connection with the 47th annual convention and exhibit of the association scheduled for Cleveland, Sept. 22 to 28, inclusive.

RESOLUTION No. 1

Whereas, the executive committee in previous years has passed certain resolutions looking with disfavor upon the practice of certain manufacturers in demonstrating buses and staging exhibits in hotel rooms and other places away from the Exhibit Halls and inviting delegates to their demonstrations and exhibits, and

Whereas, in general, the manufacturers have co-operated at recent conventions in abstaining from such practices and thus promoting the success and welfare of the main exhibition of the Association by encouraing delegates to concentrate their study upon said exhibits in the exhibition halls, be it

Resolved: That this executive committee in meeting assembled the 27th day of January, 1928, hereby vote to express its appreciation of the co-operation upon the part of the manufacturers, and to request the continuation of their wholehearted support in this matter.

RESOLUTION No. 2

Whereas, the practice of setting aside one day during the Convention week for the intensive inspection of exhibits by operating members has proved to be a general success during the several previous conventions and

Whereas, many expressions of appreciation and other favorable comment from both railway and manufacturer members has resulted from this practice, be it

Resolved: That the executive committee in meeting assembled this 27th day of January, 1928, again vote to set aside one day, the date to be determined later by the Committee on Convention arrangements, to be devoted exclusively to exhibit inspection, and request that no meetings of any kind be scheduled for that date.

RESOLUTION No. 3

Whereas, the 47th annual convention of the American Electric Railway Association will again be held in the City of Cleveland, in the vicinity of which city there are located the plants of many of our manufacturing members, and

Whereas, it is considered desirable that an opportunity be provided for delegates in attendance at the Convention to visit such manufacturing plants in such a way as not to interfere with attendance at the convention meetings or the exhibits, be it

Resolved: That this executive committee in meeting assembled this 27th day of January, 1928, hereby vote in view of the fact that the convention and exhibit closes at noon on Friday, Sept. 28, 1928, to suggest to all Manufacturer Members, that all inspections of Cleveland plants be definitely set for Friday, Sept. 28, at any time after 12:00 o'clock noon, or on Saturday, Sept. 29, at which time any manufacturers who might desire to hold open house at their plants for such inspection, might do so with the approval of the executive committee.

The Executive Committee approved the budget prepared by the director of exhibits based on a rate of 60 cents per square foot for all inside exhibition space, and $2.00 per lineal foot for all track space.

Converting Six Passenger Cars into Snow Fighting Units

Conversion of six motor passenger cars of the Gary Railways, Gary, Ind., into snow-fighting units at a total estimated cost of $25,000 has begun in the company's shops at Gary. Four cars are now being converted into sweepers, with motor-driven brooms, new controllers, salt boxes and sand bins with one-ton capacity each. Two cars are being equipped as double-end sweepers, similarly fitted and provided with modern wrecking apparatus.

Morton Products Described in De Luxe Catalog

An attractive and handsomely designed general insert catalog has been issued by the Morton Manufacturing Company, Chicago, Ill., descriptive of its line of railway appliances and industrial steel products. The book has a dark green embossed leather covering and contains an index giving the section and page number. Celluloid tabs divide the sections from A to L. In the forword it is stated that "the purpose of this catalog is to present in a clear, concise and comprehensive manner detailed descriptive and pictorial informative data calculated to be of substantial assistance to those persons charged with the decision and intelligent selection of railway and such other supplies, as are displayed on the following pages." The book is replete with illustrations and is arranged in a convenient serviceable manner for ready reference.

Chicago & Joliet to Spend Approximately $160,000

New equipment and reconstruction work for the Chicago & Joliet Electric Railway, Joliet, Ill., during the current year will amount to approximately $160,000, it is reported. A new substation at Lemont and new tracks on Morgan and Hickory Streets in Joliet are principal items of the budget. No new cars are included in the year's program.

New South Bend Station Ready for Use

Arrangements were made to open on Jan 28 the new station at South Bend, Ind., for South Shore Line passengers.

The South Bend station improvement is an added step in the program of rehabilitation of the South Shore Line begun two years ago by the present management, and reviewed previously in ELECTRIC RAILWAY JOURNAL. Up to the first of this year, more than $5,000,000 had been spent on this railroad to bring it up to the standard of operation now maintained. New steel cars, increased frequency and speed of service, automatic safety block signals of the latest type, complete re-electrification, many miles of new 100 lb. rail and double track, station improvements, new freight equipment and many other extensive changes have been made.

Metal Markets Quiet but Steady

Buying of non-ferrous metals in the week ended Feb. 1 has been small, but prices are little changed from those obtaining last Wednesday in the domestic market. Copper had been dull until Feb. 1 when an incipient buying wave started. A moderate business was done in both lead and zinc, prices for the former tending to weaken as a consequence of material declines in London. The afternoon of Feb. 1 wire-drawing interests entered the copper market rather unexpectedly and bought about 5,000,000 lb. of copper at 14.125 cents, delivered in Connecticut.

Primary producers have continued to stand pat at the 14.125 cents price, Connecticut. Moreover, they have made sales at that figure each day during the week; and business has been done on Jan. 30 and 31 at so-called Middle West points at 14.25 cents and even a little higher. On the other hand, one or two customs smelters have shaded the even eighth by from 2½ to 5 points. Incidentally, two interests that come under this classification have been firm at 14.125 cents. Foreign copper business at 14.50 cents c.i.f. has been fair.

Modest sales of zinc have been made at prices ranging from 5.65 cents to 5.70 cents. An occasional car of High-Grade is sold in New York on the basis of 7.75 cents.

Lead business was fairly good until Jan. 30, when the continued decline in London caused buyers to wonder if a reduction in prices on this side was not in order, so for the last three days the market has been very quiet indeed. The American Smelting & Refining Company continues its contract price at 6½ cents, New York.

Lead has been freely offered in good tonnages all week at 6¼ cents, St. Louis.

The tin market continues quiet, with daily sales in the neighborhood of 200 tons. Though prices have declined slightly from those of a week ago, the drop has not been sufficient to stimulate much buying.

The 99 per cent grade is practically out of the market and quotations are only nominal.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Jan. 31, 1928
Copper, electrolytic, cents per lb.	13.875
Copper wire, cents per lb.	16.125
Lead, cents per lb.	6.50
Zinc, cents per lb.	6.025
Tin, Straits, cents per lb.	54.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	.....
Somerset mine run, Boston, net tons	.....
Pittsburgh mine run, Pittsburgh, net tons	.....
Franklin, Ill., screenings, Chicago, net tons	1.70
Central, Ill., screenings, Chicago, net tons.	1.50
Kansas screenings. Kansas City, net tons.	2.125
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	5.30
Weatherproof wire base, N.Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10 2
White lead in oil (100-lb. keg), N. Y., cents per lb.	13 25
Turpentine (bbl. lots), N. Y., per gal.	$0.65

TRACK AND LINE

VIRGINIA ELECTRIC & POWER COMPANY, Richmond, Va., on Jan. 29 placed in service a 1-mile, double track extension to its Belmont Avenue line. The extension was constructed at a cost of $63,000. It will serve the rapidly growing west end residential section of the city. Extending from Westhampton Avenue to Granite St., the new tracks will furnish additional transportation facilities for one of Richmond's largest parks and athletic fields. Construction is of the most modern type. Mention that the work had started was made in the JOURNAL Nov. 5.

TRADE NOTES

C. E. SMITH & COMPANY, consulting engineers, Railway Exchange Building, St. Louis, Mo., have sent out a card which announces that this consulting engineering business will be continued under the title of C. E. Smith & Company, by men who have been associated with the company for five to twelve years, among them the following: Manager, M. H. Doyne; secretary and treasurer, M. C. Beck; M. H. Doyne, civil engineer; S. B. May, civil engineer; R. M. Boyle, mechanical engineer; B. F. Thomas, Jr., electrical engineer; M. M. Kinsey, civil engineer; F. R. Nohl, civil engineer; R. L. Saettele, engineer and cartographer, and others.

O. S. TYSON & COMPANY, INC., New York, recently announced that W. L. Towne had joined its organization as a vice-president and member of the board of directors. Mr. Towne's experience embraces engineering with the Connecticut Company and the Ontario Power Company; instructor of steam and electrical engineering, McKinley Manual Training School; assistant technical editor, United States Geographical Survey; engineering and design, American Optical Company; advertising engineer, General Electric Company; advertising manager and assistant sales manager, the Austin Company, and national advertising, in charge of educational advertising for the General Electric Company.

DREW ELECTRIC & MANUFACTURING COMPANY, Cleveland, Ohio, announces that it has sold its business of trolley line material and fittings to the Ohio Brass Company, Mansfield, Ohio.

MERZ & MCLELLAN, London, England, wish to make it clear that it is their Newcastle office only that has removed to Carliol House, Newcastle-upon-Tyne. Their London office remains at 32, Victoria Street, Westminster, S.W. 1.

NATIONAL CARBON COMPANY, Inc., carbon sales division, Cleveland, Ohio, announced the opening on Jan. 3 of branch sales offices at the present brush service plants of the company in New York City, Chicago, Ill., Pittsburgh, Pa., and Birmingham, Ala. The addresses of the new offices are: 357 West 36th Street, New York, N. Y.; 551 West Monroe Street, Chicago, Ill.; Arrott Power Building, No. 3, Barker Place, Pittsburgh, Pa., and 1824 Ninth Avenue North, Birmingham, Ala.

A. H. GRAYBURN, assistant secretary and assistant treasurer of the Norma-Hoffmann Bearings Corporation, Stamford, Conn., has resigned to take an executive position with the Hope Engineering & Supply Company of Mount Vernon, Ohio, and New York City. A. H. Ritter, New York district manager, goes to Stamford as assistant secretary, and will be succeeded in New York by F. W. Mesinger from the Stamford office. Norman Bell, assistant sales manager, has also been made assistant secretary. E. C. Lenon at Stamford will be in charge of orders, shipments, credits and collections.

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, announces the transfer of John Van Horne from Atlanta to Moline, Ill., where he will be located at 514½ Fifteenth Street, covering the Tri-Cities, on the sale of its products. He will operate under the direction of R. D. Malm, Western manager at Chicago, Ill.

TIMKEN ROLLER BEARING COMPANY, Canton, Ohio, has authorized the expenditure of $4,000,000 for the coming year to be devoted to increasing the production facilities of the company. The greater part of this expansion program concerns the company's plant at Canton, where both the steel mill and the bearing manufacturing plant proper will be considerably enlarged. Among other features a new substation will be built for supplying electric power for both the steel mill and the factory.

ADVERTISING LITERATURE

MONITOR CONTROLLER COMPANY, Baltimore, Md., has recently issued bulletin 111, with illustrations and descriptions of its resistors.

TIMKEN ROLLER BEARING COMPANY, Canton, Ohio, has issued a booklet "The Truth About Anti-Friction Bearings," in which the design, function, necessity and performance of such bearings are discussed.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has recently issued a booklet "The Application of Electric Drive to Motor Buses." The booklet is illustrated with pictures and charts.

MARTINDALE ELECTRIC COMPANY, Cleveland, Ohio, announces a four-page folder, illustrating and describing three types of portable blowers. The company states that the folder will be mailed on request.

SCHWEITZER & CONRAD, INC., Chicago, Ill., has issued an illustrated 20-page looseleaf bulletin descriptive of its "S and C" high potential fuse.

It Depends on Whose Ox Is Gored

WHILE New York, under the leadership of its genial Mayor, Jimmie Walker, is marshalling its forces to fight to the last ditch the application of its rapid transit lines for a fare increase from 5 cents to 7 cents, there comes an interesting side light on how political expediency changes the tune with which the public's ears are regaled in the country's metropolis.

Speaking of plans for the extension and improvement of the water supply (a municipally-owned enterprise) the Mayor calls the attention of the Board of Estimate to the need for increased revenue. The water rates, he thinks, should be increased. He is reported by the New York *Times* to have said: "I myself paid $13.20 last year and that was for a three-story house in which seven persons lived. A 10 per cent increase would mean $1.32 more. I guess that wouldn't break me, and I don't think any taxpayer would object seriously to so modest an increase."

This is a municipal plant, of course. One's nerves could scarcely survive the shock of hearing a New York public official use that reasoning in connection with a privately-owned utility. The very arguments of expanding plant and improving service which are used by the so-called "traction interests" in soliciting a higher rate of fare are howled down by the defenders of the people in the one instance and used by them for the same proposition when it comes to the municipally-owned service. Of course, this doesn't demonstrate that the arguments are wrong. It only proves anew the old saw that it makes all the difference in the world whose ox is gored.

Let "Convenience for the Greatest Number at the Least Cost" Be the Slogan

IN ITS issue of Sept. 17, 1927, *Liberty* labeled street cars as archaic and on their way out. It called upon the motor car manufacturers of the country to produce a statesman of transportation who should lead us out of the hopeless traffic tangle which exists not only in large but in smaller cities as well.

ELECTRIC RAILWAY JOURNAL, in its issue of Sept. 24, challenged that suggestion from the standpoint of the public interest. Simultaneously, Mr. Storrs, managing director of the American Electric Railway Association, offered to supply *Liberty* with fundamental data regarding the relative importance of various transportation agencies in handling the masses of people who daily move back and forth on city streets.

Now *Liberty* has done a commendable thing. It started out to get the facts on the traffic situation. It interviewed men who are in position to talk with authority on this subject. And in a series of three articles, the last of which was published in its Feb. 11, 1928, issue, William F. Sturm tells the story of the traffic tangle in the light of this new knowledge. Mr. Sturm got the facts. *Liberty* had the courage to publish them. In doing so it "scooped" the entire popular press of the country in presenting for the first time so comprehensive a discussion of the baffling problem of traffic from the standpoint of the public interest.

Mr. Sturm, as the result of his investigations, concluded that a fair solution of the problem requires adequate consideration of all the transportation factors involved in it—automobiles, street cars, rapid transit lines, and railroads. He omitted trucks used in the movement of freight and commodities on city streets, which should also be included. He then says: "The co-ordination of all methods of transportation is necessary in order to solve the problem in the broadest way. While it may be true that the motor industry is directly responsible for traffic saturation, still the problem does not belong to it alone. Steam and electric roads should see the wisdom of such an institute *to study the problem from the standpoint of the public interest and to develop economically sound principles for bringing about relief.*" (The italics are ours.)

Regardless of the merit or practicability of the idea of a traffic institute, electric railways need little urging to take an interest in the traffic problem. Not only are they now taking a very active interest, but they are anxious to promote a sane solution. They are content to rest their case of the right to existence on the broad ground of the public interest and to have the matter of traffic congestion relief approached on the principle of the greatest good to the greatest number. In Chicago the railway has definitely taken the lead in championing the public's interest in traffic matters. The results already achieved there are making traffic history and testify eloquently to the public-spirited viewpoint of the railway's engineers and to the good judgment of the public in placing its traffic problem in their hands.

The viewpoint from which the traffic matter is approached and the principles upon which proposed relief measures are based (or the lack of them), affect the economic soundness of plans that are suggested. There is hopeless confusion of thought on the whole subject and total lack of public understanding. Even experts differ widely on some of the fundamental factors involved. Traffic and transportation are tied inseparably with the broad problems of civic development and community planning. Yet many city planning commissions give totally inadequate attention to making adequate provision for vitally needed rapid and economical transportation. The JOURNAL hopes that the popular press of the country will follow *Liberty's* lead in going after the facts of the traffic tangle. Then let the solution be championed under the banner: "Convenience for the greatest number at the least cost."

Interborough Fare Case Presents Interesting Legal Aspects

AS A RULE, better progress can be made by railway companies in securing necessary fare increases by frank dealing with the authorities and public than by resort to the courts. There are times, however, when the courts are the only recourse. This may be the case in New York with the Interborough Rapid Transit Company if its request for a higher fare is refused by the Transit Commission for want of authority or on any other ground.

For years the company has been endeavoring to give service at an inadequate fare. To do so it has asked the holders of its securities to make sacrifices, which for the most part they have done. But when the Transit Commission recently indicated that it intended to order the company to spend $39,466,000 for new cars, platform extensions and other changes, it was obvious that some positive movement for relief had to be made. Without a higher fare the necessary capital for these changes could not be secured.

While the Interborough application is based on the usual ground that the company is not receiving a reasonable return on the fair value of the property, its petition to the Transit Commission is especially interesting from a legal standpoint for two reasons. One is because of the unusual franchises under which the company operates. The other is because it groups in its exhibit of return the earnings, expenses and rental of a leased property, the Manhattan Elevated Railway, though it also claims that a fair return is not being earned on the subway system itself. The Manhattan Railway is considered part of the system covered by the so-called 1913 contract because, in that contract, through services over certain of the two divisions were required, free transfers between them were specified at certain points and the city acquired a right to share in the earnings of the Manhattan Railway third track and extensions.

While the city is the owner and lessor of the subway proper, as distinguished from the equipment, the company holds that in this capacity the city is acting in a proprietory, and not in a governmental, capacity. Hence, its status in this ownership is similar to that of any railroad company and the fares to be charged on its leased subway track are subject to the regulatory power of the state. To strengthen this contention the company points out that nowhere does its franchise say that the fares to be charged are to be determined by the city authorities.

The financial returns of the company for 1927, based on the Transit Commission's figures of reproduction costs, vary from 1.76 per cent for the Manhattan Elevated Railway, to 2.98 per cent for the subway division. The returns during each of the previous six years are not greatly different.

Besides this low return on the value of the property, the company urges several special circumstances which emphasize the justice of its claim. One of these is that the city, though a partner in the enterprise both in investment and in profits, is building a competing rapid transit railway that will take from the company's lines at least 110,000,000 passengers a year. This competition, it points out, was not contemplated in the 1913 leases and contracts. The second circumstance is the proposed order of the Transit Commission for new cars and the order actually made for extension of local platforms and other changes, as already mentioned. It is obvious that some means must be found to improve the company's credit if it is to raise the money to carry out the commission order for improved facilities.

The essential relation between service and fare has been placed squarely before the New York public, which has been so long misguided by the 5-cent fare fetish of its politicians. For the best interests of the city, the higher fare should be granted.

Home Construction of Cars Is Deceptive Economy

SOME few street railway managements in this country are under the impression that they can build their own cars at a price lower than similar cars can be purchased from a car builder. "We must have our shops for maintenance work anyway," they argue, "and we can save most of the overhead cost on any cars which we build. Moreover, a certain amount of car construction will give a better load factor on our men because they can fill in time on car building which otherwise would be lost."

The idea that there is economy in cars so built is specious. There is every reason why a car builder can put out a better car and build it more cheaply than a railway company. When car bodies were entirely of wood, the differential in cost between the car builder and the repair shop was smaller. But economical steel car building requires machinery and methods which are out of place in the usual repair shop.

Building cars in quantity as he does, the car builder can afford to keep in touch with improvements in design and in methods of manufacture. Some of his methods and equipment are patented and could not be used by the home builder. Where cars are built in considerable quantity at home, there is a tendency, almost overpowering, to cling to one design regardless of the progress in the art.

A railway company building its own cars is likely to be deceived as to the cost of the work. The chances are that not all elements of cost are included. Overhead charges are apt to be undervalued, especially when manufacturing is undertaken in a shop poorly adapted to the purpose. The rearrangements required, the attention given to the work by the higher officials not actually occupied with it, the extra accounting needed, the additional interest and insurance required—all these are essential elements of cost that are usually underestimated and often overlooked entirely.

Most serious of all, the time and attention of the officials in charge of the work, and the space in the shops, are diverted in part at least to the problem of car building instead of being concentrated on maintenance. Unless there is a separate organization and additional space equivalent to that which a car builder would need, maintenance is bound to suffer. The extra cost of maintenance and the loss of reliability of the service almost invariably far outweigh any economic gain to the railway. Experience has proved this to be so despite the best of intentions.

It should be remembered that the primary purpose of a railway is the safe and speedy operation of its cars. Anything which detracts from this is apt to be of very deceptive economy. Electric railway companies can well keep out of car building.

In Most Cities Electric Car Speed Can Be Increased Easily

FIGURES quoted in the discussion on traffic signals at the New York Electric Railway Association convention this week indicate that in congested traffic, electric cars make only half the speed of automobiles, largely because of the stops required to receive and discharge passengers. If the low speeds just quoted are true, it means that the cars miss practically every other "go" signal, and that any reasonable means for reducing the time spent at stops would greatly help the situation. It was during the discussion on this subject that H. N. Smith of the Municipal Bureau of Gas and Electricity, Syracuse, N. Y., made the very pertinent inquiry, why not more raised island platforms at car stops, and why not more skip stops?

As Mr. Smith pointed out, raised platforms when protected at the ends by bulwarks give a feeling of security to waiting and discharged passengers, which is not afforded by less permanent safety zones. They thus permit waiting patrons to be ready to board the car when it arrives, and they permit those leaving the car to remain in a safe place until they have a chance to reach the curb. Skip stops, he pointed out, while introduced during the war quite generally to economize fuel, should be equally useful in time of peace to economize time. In sections where streets are skipped, an electric car should be able to make as good time as the automobile, and so more nearly approximate its over-all speed.

There is no doubt that the low speed made by cars in congested streets is one of the most serious obstacles to economical operation, as well as a discouragement of patronage. Every effort should be made through rapid acceleration, rapid braking and short passenger stops to bring the schedule speed of the cars up to that of the other vehicles which use the street. Still another suggestion along these lines, that comes up from time to time though not brought out at the meeting, was whether the time had come to have electric cars stop at the far corner rather than at the near corner, at least in the congested districts.

Observations on a number of streets with manually controlled signals indicate the following situation: As the electric car approaches the near corner its further movement is prevented by automobiles on the track, as well as at the side, all waiting for the "go" signal. When this is given, the electric car is often in the middle of the block, and by the time it gets to the corner and receives and discharges its passengers the time for the green signal has passed, and the car must wait for another cycle. If this happens regularly, the car misses one signal at each corner. This may be the reason that the electric car makes only half the speed of the automobile on the same street, as quoted by one of the speakers at the New York meeting.

Assume, however, the far stop. The car, as before, waits for the green signal, perhaps midway in the block, because it cannot get nearer with automobiles on the track. When the green signal is given, the car makes the crossing with the group of automobiles accompanying it, and then stops and discharges its passengers at the far corner, preferably on a raised platform 20 or 30 ft. from the corner, rather than directly at it, so as not to be in the way of automobiles making the turn. It then proceeds as near to the next corner as possible to repeat the performance. While it may miss a traffic cycle occasionally it does not seem that this should happen as frequently as with the near-side stop.

Conditions have changed entirely since the near-side stop became general some 25 years ago. Previous to that time the far stop was generally used, because the streets at that period were muddy and with the far stop the passengers could use the "cross walk" in passing between curb and rear platform. The main argument in favor of the near-side stop was that it would help to avoid collisions with vehicles crossing at right angles. At that time, of course, there were no traffic lights in use anywhere and very few traffic policemen. These arguments show what a tremendous change has taken place since the near-side stop was established. As regards city traffic, we are in a different age.

The far-side stop may not always be advisable, but it seems worth trying in congested streets. A distinctive stop sign, which should be put up anyway, would prevent any confusion on the part of waiting passengers.

Improvements in Equipment Permit Faster Schedules

SPEEDS of street cars, particularly in congested traffic, bear only a slight relation to the maximum speed which the motors can develop on a straightaway run. It has been pointed out many times that the schedule or average speed is determined to a great extent by the number of and time used in stops and the rates of acceleration and retardation. In other words, the car has so little opportunity to reach the maximum speed that its value is of little moment. On the contrary, with any given number of stops and standing time, the average speed will be greatest when the motors have the ability to start the car from rest and reach a reasonable speed in the shortest time, and the brakes have the ability to stop the car from this speed most rapidly.

Recent developments in equipment design have done a great deal to increase the possible acceleration and braking rates. Some of the results obtained were discussed in papers presented at the winter meeting of the New York Electric Railway Association. The new forms of drive with high reduction gearing have made possible the use of small, high-speed motors which still are able to accelerate the car more rapidly than has been practicable with the ordinary gear drive. In fact, tests have been made with one of the new types of drive that showed acceleration of 4.27 m.p.h. per second. This is far higher than anything used in practice, but indicates what can be done. Equally good results have been obtained with new types of brakes. Tests referred to by one of the speakers showed that from any initial speed of 20 m.p.h it was possible to reduce the stopping distance 40 ft. In schedules this works out to an increase in average speed of 6.4 per cent.

Apart from the ability to maintain faster schedules on a clear track, these improvements make it possible for the car not only to hold its place in the traffic line, but give it the ability to get away from a standstill faster than the average automobile, while being able to stop rapidly when necessary. To obtain the full advantage of these improvements requires skillful operators and good training; but these are necessities of present-day street railway service. Failure to take advantage of improvements such as these is likely to spell the doom of the non-progressive property.

Most People Are Fair When They Understand

The street railway business has put its worst difficulties behind. The industry now needs new confidence in itself and the courage to tell its story to the public

By Roland B. Woodward
General Secretary Rochester Chamber of Commerce, Rochester, N. Y.

This article was the basis of an address by Mr. Woodward before the meeting of the New York Electric Railway Association held in New York City on Jan. 31. Coming as it does from a speaker representing the business man and car rider rather than the railway operator, it presents so complete a grasp of the railway situation in so forceful a manner as to commend it to every JOURNAL *reader.*—EDITOR.

WHEN the teacher asked the small boy what was the shape of the world, he pondered a moment and then replied, "Father says 'It's in a hell of a shape'." When anybody asks "What is the shape of the street railway business?" the common answer is similar. But the street railway business has passed the zero hour and is on the road to recovery. This recovery is not due to the fact that anybody likes the street car or wants the street car; but because at least four out of five need the street car and must have it to carry on from day to day.

The street car business has been the most maligned, condemned, abused and least appreciated and understood factor in our modern urban life. It has been the football of local politics, the source of unjust tax exactions, the object of unreasoning abuse. And the strange thing about it has been that the mass of the people, who must use it because they have no other means of transportation, have joined in the hue and cry and thought they were rendering a public service.

This is the strangest bit of civic crowd psychology I have seen in twenty years of experience in dealing with the public. Usually there is a crowd consciousness of identity with the thing they support and want and need. The baseball fans quickly espouse the cause of the home team though it may be made up of strangers from other cities. They pay for the privilege of rooting for it whole-heartedly. The readers and followers of a given newspaper swallow much they don't like, but loyally stick to their favorite and pay for the privilege year after year. It becomes an authority to them and does much of their thinking for them. The employees of a great industry develop a mass loyalty to all the life of that industry and are proud of its progress. But the street railway industry, great as it is and necessary as it is in the life of any city, has been bled and abused and abused and bled while its millions of users have stood on the side lines or have joined in the attack—not realizing that in the end they must pay the damages in poor rails, poor roadbed, poor cars, and inadequate service from an impoverished company.

I say the street car riders must pay in the end, though I know under a fixed fare plan how difficult it is to pass increased operating expenses on to the consumer. It is true that the stockholders suffer, but it may be that they can better afford to lose their money than the car users can afford to lose the service. But in most cases the stockholders won't lose because our communities are going to need mass transportation more and more as traffic conditions become more difficult.

MARKS FOR THE TAX COLLECTOR

Street car companies seem to have been shining marks for the tax collector. When they didn't make any money with which to pay taxes they took it out of their principal. The federal income tax, the state franchise tax on gross earnings, the municipal special franchise tax, and a few others add to their zest in making ends meet. But the most interesting one is inherited from the horse car days. Of course, the horses wore out the streets, to be sure not more than other horses, but these horses were especially attractive for taxation. The horses have long since passed away, but the tax is still with us. This tax, required by the state of New York from street railway companies, is unjust and indefensible. Without this burden the street railways are now taxed much more on their gross business than other utilities and nearly 80 per cent of every net dollar earned goes for taxes.

Chief Judge Cullen described the paving tax in his decision in the case of the City of Rochester vs. the Rochester Railway Company: "The tax," said Judge Cullen, "is paid in the form of paving and other materials for street construction. The materials which go into the paving are really purchased by the railway company and turned over to the municipality for the benefit of the community at large. The railroad derives no special or peculiar benefit from the construction of the paving; indeed it is a burden rather than a benefit."

That is carrying the taxing power pretty far. Let us see how it works. Nineteen feet width in a street with double tracks must be paved and kept paved by the street railway company. Who uses these 19 ft. of pavement?

Digitized by Google

Everybody—trucks, wagons, pleasure cars. Eighty-five per cent of the occupancy of the street for traffic and for parking is by vehicles, not street cars. In addition to paying for the 19 ft., the street car rider is a taxpayer, and certainly the street car company, which is one of the largest taxpayers, must pay its part in the proportion of paving cost assessed against the city at large. This paving tax business goes further. Owners of property on a given street want it widened, or the city authorities want it graded or the development of a city plan requires that it be changed somehow to meet conditions in some other street. The owners and the car riders through their agency, the street railway company, are required to tear up good rails, good ties, a good foundation and chip in tens of thousands of fares, which, perhaps, are needed for new rails elsewhere in the city, or for new cars, or for more frequent service, to pay for relaying of track and repaving 19 ft. This sort of thing has cost the Rochester railway lines approximately $500,000 a year for several years.

WHENEVER government cripples a great public convenience or necessity by unjust taxation, by unjust restriction, or regulation, those who need and use that necessity suffer first, suffer most and suffer longest.—ROLAND B. WOODWARD

It requires 50,000,000 fares in one year to pay the street railway companies' paving bill in New York State. The answer, of course, is that the street car rider doesn't know the load that is being put on his back. He doesn't know that in the end he will have to pay the bill somehow. Whenever government cripples a great public convenience or necessity by unjust taxation, by unjust restriction, or regulation, those who need and use that necessity suffer first, suffer most and suffer longest.

Though the users haven't fully sensed it, there is an identity of interest between the owners and users of any wisely regulated public utility.

There is another group besides the street car riders vitally interested in the street railway problem. Good mass transportation is essential to urban life. This means manufacturing and retail trade. Stop street car service or cripple it and tens of thousands find it difficult to get to work. Management and the owners of industry have a vital stake in good transportation for their workers. When the worker is handicapped by inadequate service his job suffers or he loses the job. Industry can't afford to have either happen. If the workman pays for something he doesn't get—in the end industry will have to help foot the bill. Good transportation is essential to the worker and therefore to industry in our modern life. Large factory operation isn't possible without it. Mass transportation is a prerequisite of mass production.

PROBABLY four out of five retail customers are carried by street cars and not by automobiles. This consideration should not be overlooked when the retail merchant is importuned to use his influence to have the city set aside a third of the entire roadway for the storage, politely called parking, of private automobiles.—ROLAND B. WOODWARD

FOUR OUT OF FIVE ARE CAR RIDERS

Large retail business can't live off automobile trade. If private automobiles monopolize our streets and slow up mass transportation or cripple it, the movement towards decentralization of retail trading will be accelerated. Probably four out of five retail customers are carried by street cars and not by automobiles. This consideration should not be overlooked when the retail merchant is importuned to use his influence to have the city set aside a third of the entire roadway for the storage, politely called parking, of private automobiles.

The manufacturer and retailer have not taken any great interest in the problem of street car service. They have felt that it would work out its own solution. It probably will, but the solution of the problem would be speeded up if the manufacturers and merchants vitally affected would concern themselves to see that their employees and customers were given a service not handicapped by unreasonable taxation, not slowed up by traffic congestion or hampered by unwise regulation.

The street railway business must have had a naturally strong constitution. During my observation of twenty years, the street railway company in Rochester has submitted to a sufficient number of major operations to have put a less vigorous business under the sod. This vitally testifies to a public need. No substitute has been found. The increase of automobiles from 4,500,000 in 1917 to probably 24,000,000 in 1928 has checked the growth of mass transportation, but has also enlarged the riding habit from which the street car companies will eventually benefit. The fact that street cars represent only 15 per cent of the occupancy of the street, and at the same time carry 85 per cent of the people transported, justifies it as a necessity that must be given consideration in our increasing traffic problem.

Let me quote you from an address before the American Electric Railway Association by Sidney D. Waldon, president of the Rapid Transit Commission of Detroit:

> A pedestrian takes up about 10 sq.ft. A moving automobile, with a safe margin all around, occupies 270 sq.ft. Assuming an average of two persons per vehicle, then each pedestrian requiring 10 sq.ft. on the sidewalk, will, as a motorist, require 135 sq.ft. in the traffic space. Assuming that nothing but private passenger automobiles are to be used and that the full capacity of two 15-ft. sidewalks is to be balanced by a roadway of equal automobile capacity at two persons per car and there will be needed central traffic space of 198 ft. Adding two 8-ft. parking strips and two 15-ft. sidewalks would make up a total right-of-way of 244 ft.
>
> On the other hand, passengers in bus, street car and rapid transit train occupy only 5 to 10 sq.ft., or reasonably comparable to the space requirements of the pedestrian. While the pedestrian and the street car passenger occupy about the same square footage of street area as formerly, the average motorist requires 13½ times as much space as either. If, in providing for future transportation, the automobile is to be regarded as a permanent factor, then the old standards of street and highway width are obsolete, and new ones must be adopted.

The answer is not to be found in increased speed, for it has been demonstrated that as the speed increases the distance between vehicles must be increased for safe operation. A speed of 15 to 20 m.p.h. gives the maximum movement of traffic through any given traffic lane.

Digitized by Google

To provide road area to accommodate the ever-increasing demands or needs of the motorist is beyond the financial ability of any city. The cost would be staggering, so if increased transportation is required it must be mass transportation, bus, street car or rapid transit, overhead or underground.

The natural course of events is quite clear. Students of urban traffic problems are turning to several obvious things. First, increasing restrictions on the use of the roadway, especially in congested districts, for the storage or parking of privately owned automobiles used for the transportation of persons. Second, the routing of privately owned automobiles used for passengers (not freight) so that they will not interfere unduly with mass transportation. Third, creation of new roadways and widening and extension of others without street car tracks for use of privately owned automobiles where the cost of such improvement is not prohibitive.

All signs point to the need for more and better mass transportation. The much abused street car will be increasingly needed by the mass of the people. Its usefulness, its cheapness, its dependability has been amply demonstrated. Its need of flexibility is being met by the use of buses. It is a natural monopoly and in its control, subject to proper regulation, should be all the mass transportation in its community because only in that way can the community be best served.

THE street railway companies need a back log of informed public opinion, especially on the part of the car riders . . . Tell the car riders the things they want to know. Then you won't have to spend so much time on public officials.

—ROLAND B. WOODWARD

As an instrument in community service it is not understood or appreciated by even business leaders whose employees and customers need and depend upon it daily. It has presented its worst side to the public. Its failures or shortcomings are before our eyes daily. Its difficulties are hidden and unknown. It is hard for a starving man or a starving business to have a best side. Only prosperous businesses are popular. A prosperous business can be fair, even generous to its workers, its customers, its stockholders. A hard-up business is usually in wrong with everybody.

The street car business has dealt fairly with its employees. Not only the hourly wages, but the "real" wages, the purchasing-power wages, have continually increased since 1922. The companies have managed to give fair service to their customers while fighting for a living fare.

The stockholders have been passed by, almost forgotten. The balance for dividends averaged for the country as a whole has been little more than one-half what the Supreme Court of the United States has declared is a fair return upon capital invested in public utilities.

As we consider ways and means of improving the status of the street railway companies so that they may give adequate service and earn a fair return for their stockholders, we are impressed that the part they play in the scheme of things in our daily life is not understood by people generally. When people are not up on a thing they are usually down on it. City officials and legislatures, as a rule, do what they think the people will approve. Now and then they put something over which they think the people won't know about, won't care about or won't clearly understand.

The street railway companies need a back log of informed public opinion, especially on the part of the car riders. The timid manager who grew up in the old school where everything was done quietly, where things were fixed up without public participation, is likely to shy off at the thought of building up public support, through publicity, for his program and policies.

But this plan has worked in every phase of our modern business life. Not many years ago advertising and publicity were left to the crooks and the fakers. Now the crooks and fakers are killed off by the advertising of legitimate business. Study the effects of the advertising of the General Electric Company, the American Telephone & Telegraph Company, the railroads, and notably some gas and electric companies.

Tell the car riders the things they ought to know. Then you won't have to spend so much time on public officials.

Your own employees should be enlightened supporters of your policies. They should be sound salesmen of the street railway companies' cause. My experience teaches me that they need education on this subject as much as the car riders do. The car rider often expects the impossible. If he knew the facts he might be a supporter instead of a critic. Your employees may know the facts, but rarely take the trouble to explain them.

You have few defenders or advocates because few know how to defend you or advocate your cause. There is more general ignorance about your business than about any conspicuous business in the community. I've never known a man who has investigated your problem who has not been soundly converted to your cause. He is invariably convinced that you are overtaxed, underpaid for what is expected of you and not appreciated as a factor in city development.

What you need is an Al Smith or a Will Hayes as president of a street railway extension university. It is not a job for a mechanic or a conductor; it's a job for a leader, an educator, who has insight into the human elements and courage which comes from the justice of his cause. Under such leadership a campaign of education could be conducted in every city of the state, a campaign that would change public opinion from a liability to an asset. Most people are fair when they understand, but exasperating when they don't understand.

During these lean years you have learned to live economically, learned to go without. This always chastens the spirit. Now you need new confidence, new public support and approval, new prosperity. You have passed the zero hour in the street railway business. The worst is behind you. Mass transportation, which you alone can give, will be more needed and demanded in the future.

If fares go too high the law of diminishing returns will probably operate to your disadvantage. Therefore, you must manage and operate your properties efficiently; you must be freed from unjust taxation; you must fight the cause of the car rider; you must educate the public; and finally you must remember that confidence in the public and courteous service to the public in turn builds up confidence in the company and consideration for its rights.

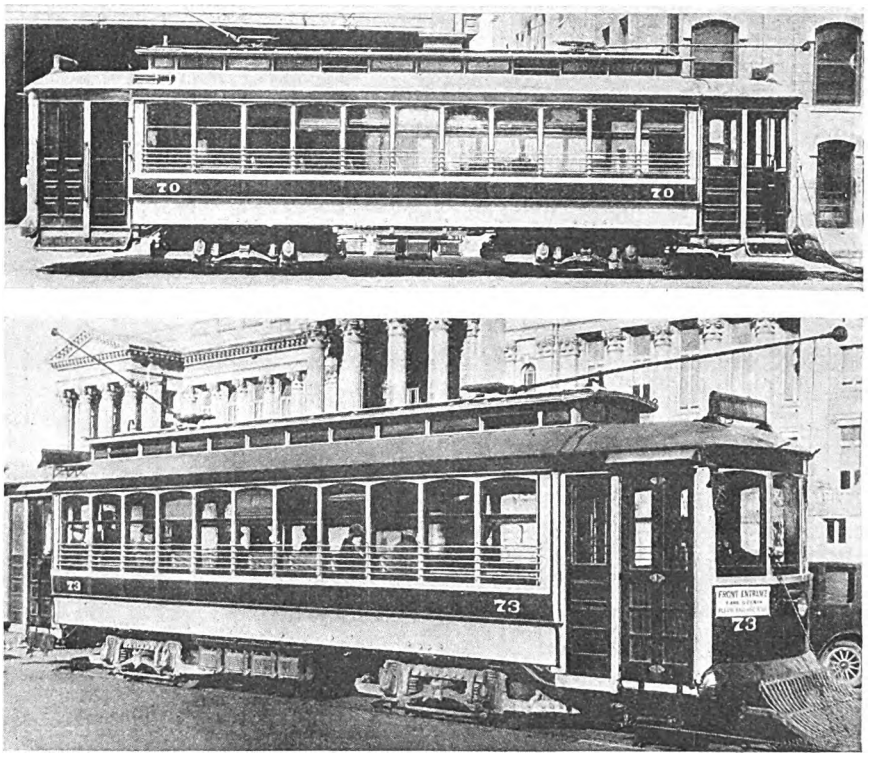
How a Small City Property Was Resuscitated

By the installation of improved cars, the use of merchandising methods and a slight increase in its fare, the Pueblo Electric Railway, which operates in a city of about 50,000 inhabitants, was saved from abandonment

IN THESE days of intensive automobile competition some electric railways conducting purely a local business in small cities have had to abandon their track. There was no doubt in most, if not all instances, that they were performing a needed public service to a large proportion of the community, but with increased costs, restricted fares and no gain in passengers they were unable to make both ends meet. Experience of the Southern Colorado Power Company, which operates the Pueblo traction system, shows that even for railways in cities of from 50,000 to 60,000 there is hope. By co-operation with the public a program was adopted which saved the road for continued usefulness.



At top, 16-ton double-truck car with end entrances and exits before conversion Lower view, the same car after conversion for one-man operation

In 1920 the number of revenue passengers carried by the Pueblo line amounted to 9,201,474. By 1925 it had decreased to 6,947,494, a loss of 24 per cent in five years. In November, 1919, the fare was increased from 5 to 6 cents for three years and later the 6-cent fare was renewed for a like period but under conditions which provided it should revert to 5 cents in 1925. Birney one-man cars were in use on a few outside lines, but a city ordinance provided that all other street cars should be operated by two men.

By the fall of 1925 it was obvious that radical steps would have to be taken to save the service and the following program was decided upon:

1. To ask for a change in the ordinance so as to permit one-man car operation in all parts of the city.
2. To obtain an increase in fare to at least 7 cents.
3. To remodel the double-truck two-man cars for one-man operation.
4. To increase the mechanical efficiency and speed of the cars, if possible; to improve their outside and inside appearance and make them more attractive and comfortable.
5. To apply merchandising methods to offset as far as it could be done the decrease in traffic due to the natural increase in automobiles.
6. To accomplish all these results without affecting adversely the existing good public relations and to increase the friendly relations of the public as much as possible.

It is not necessary to go into all of the details by which this program was carried out except to say that it was accomplished with the approval of the authorities and citizens of Pueblo. The results are shown in the detailed report of the company for the year ended April 30, 1926 and 1927, given in the accompanying table. The purpose of this article is primarily to tell of some of the improvements and economies introduced, so that other companies similarly situated may understand the methods that have proved satisfactory in Pueblo.

Eleven of the 33 passenger cars of the company were of the standard Birney type. The 22 others were double-truck cars, sixteen with side entrance and exit and six with end entrance and exit.

During 1926 and up to July 1, 1927, nineteen of the two-man cars were remodeled to provide them with front entrances to fit them for one-man operation. They were equipped with the latest safety car control equipment, interlocked doors and steps, treadle-operated exit door, etc. While not all cars have been changed over yet, the rehabilitation mentioned represents 57 per cent of the passenger cars owned and 82 per cent of the passenger cars normally operated. Colored destination lights were used to indicate the three main routes operated.

The new rate of fare established by the ordinance secured was 7 cents cash and fifteen tokens for $1. Continued effort was made to increase the sale of tokens, as using them in change meant a saving of time to the operator, as well as of money to the patrons. Arrangements were made with the drug stores to sell tokens without extra charge, and a special campaign was carried on in which token holders were given free with each dollar's worth of tokens purchased. Full fares paid by tokens for the year ended April 30, 1927, showed an increase over that of the previous year of 116 per cent.

Newspaper advertising was used freely, advertising cards were carried in the interiors of the cars and the front dashers carried signs, usually with wording of a civic nature and some reference to the advantages of riding the cars.

Operators were instructed that they were primarily salesmen, selling rides to the public against keen competition of private automobiles. To avoid dissatisfaction among patrons who might pay their fares by inadvertently dropping more coins in the fare box than necessary, the operators have been provided with excess fare slips. These carry a notice that the operator himself cannot return the excess money, as it would make him short with his fare box, but the slip can be presented at the office and the excess money will be returned. The operator punches a number on the slip indicating the number of cents overpaid and signs his name to it.

During the 1926 State Fair, which was held in Pueblo, the company entered a float representing street car transportation and received the third prize awarded.

Among the methods of improved maintenance in rolling stock adopted were the following:

Overhauling car bodies, trucks and motors on a mileage basis.

Turning axle bearings from individual fit to the axles, which gives perfect gear and pinion clearance and greatly reduces the noise.

Keeping each pinion paired with its gear for the life of the pinion.

Swedging worn carbon brush-holder boxes to restore the brush clearance to standard.

Replacing old type brush-holder springs with new type.

Making new field coils of flat copper to replace the old type wound with round wire.

Installing spring cushions between field coils and motor bearings to keep the field coil from vibrating and to take up any shrinkage of the coil which may occur.

Pit grinding of flat wheels.

Hot dipping and baking of all armatures during regular overhaul; also rebanding and building up between armature coil and band of all armatures showing any looseness of the band.

Hot dipping of all newly rewound armatures and temporary banding while hot with wood strips between the coil and the temporary bands, then baking and permanent banding.

In its track maintenance, it has developed an ingenious method which has afforded considerable saving. When a rail joint gets low there is always a certain amount of wear on one end of the angle bars and formerly these bars were discarded. Now the joint is raised to a level and the worn part calipered and built up by means of the electric welder. Then it is ground to a perfect fit and the old angle bars replaced.

The company has found this method better than using new angle bars because it is possible to adjust the fill and grind both the rail and angle bar, thus making a fit far better than if the old angle bar was replaced with a new one.

EARNINGS AND OPERATING EXPENSES OF PUEBLO RAILWAY SYSTEM, YEAR ENDED APRIL 30

	1927	1926
Passenger revenue, cash fares	$396,594.68	$397,560.41
Special car revenue	50.00	.....
Miscellaneous transportation revenue	47.45	161.43
Total earnings from transportation	$396,692.13	$397,398.98
Earnings from other railway operation	2,011.10	1,983.32
Total railway earnings	$398,703.23	$399,382.30
Recapitulation of Expenses:		
Operation	$197,366.31	$222,543.61
Maintenance	77,762.19	75,953.21
Taxes	46,927.14	51,423.01
Total all expenses	$322,055.64	$349,919.83
Net earnings	76,647.59	49,462.47
Per cent operating expenses to gross earnings	80.8	87.6
Operating Expenses:		
Superintendence of way and structures	$1,953.45	$1,820.00
Maintenance of track and roadway	20,111.74	24,113.78
Other maintenance of way	169.38	830.75
Poles and fixtures	2,243.93	1,049.08
Distribution system	3,284.82	2,909.45
Buildings, fixtures and grounds	442.67	0.87
Total way and structure maintenance	$28,205.99	$30,723.93
Superintendence of equipment	$259.97	$240.24
Cars	31,695.16	28,299.61
Electric equipment of cars	14,047.75	12,061.67

Total cost of energy	19,971.02	20,768.07
Superintendence of transportation	$13,301.33	$12,636.64
Passenger conductors, motormen, trainmen	122,176.75	141,364.08
Miscellaneous car service employees and expenses	8,065.12	7,904.72
Carhouse employees and expenses	7,406.77	6,860.98
Signal and telephone and telegraph systems	445.92	445.92
Other transportation expenses	85.11	81.08
Total expense conducting transportation	$151,481.00	$169,293.42
Total kilowatt-hour energy	4,823,548	4,529,474
Cost per kilowatt-hour	$0.414	$0.459

Digitized by Google

While the passenger revenue in 1927 showed a slight falling off from that in 1926, the outlook is that the street railway will be called upon to provide greater service than in the past to the public. This is not only because of the constant growth of the city, but because increasing street congestion has emphasized the need of restrictive ordinances on parking in the downtown streets. An ordinance recently passed on this subject provides no parking in the downtown section along any one block in which a street car makes a regular stop, and parking in the other downtown districts, including side streets, will be limited to one hour. Formerly, parking was practically unrestricted.

Small Property Perfects Safety Methods

Tide Water Company of Wilmington, N. C., has won two prizes for excellence in safety precautions. Its methods are detailed

IT WAS not through a spasmodic effort that the Tide Water Power Company of Wilmington, N. C., earned the Anthony N. Brady medal given in January for notable progress in safety and sanitation by railway companies operating less than 1,000,000 car-miles per year. The company has a long and consistent record of safety effort. In fact, it was the winner of the Fitkin railway safety trophy in the safety contest conducted in Sept. 1926. This contest was open to all of the National Public Service Company's railway properties.

The Tide Water Power Company and its subsidiary, the Coast City Transit Company, operated a total of only 959,119 vehicle-miles during the year ended Dec. 31, 1926. The Tide Water Company owns 33.6 miles of single and double track in Wilmington, N. C., and vicinity. It also owns an 11-mile suburban line serving Wrightsville Beach and intervening territory from Wilmington. Passenger service in the city is given entirely by safety cars. The Coast City Transit Company operates bus lines and feeders to the car service from the outskirts of the city.

The suburban line has a decidedly seasonal traffic. In the summer 22 large double-truck cars are required to carry the enormous number of excursionists, whereas during the off season three cars are sufficient. Summer also brings a tremendous increase in freight, express, car load and package shipments. New men must be trained each spring in advance of the season, so that ample and safe transportation may be assured. All this means, necessarily, that there will be a considerable increase in the number of accidents.

On the other hand, its ownership at the beach of a large bathing pavillion has brought the company in contact with life saving methods. Life guards are employed there, and life saving demonstrations are held on the beach at regular intervals. Company employees have also made a study of the prone pressure method of resuscitation. Two hospitals in Wilmington have requested a demonstration of this method by the company's men before their doctors and nurses. Incidentally, the company's general manager was elected chairman of the committee on first aid in life saving for the Wilmington Section of the Red Cross. Besides instructing every employee in the prone pressure method, the company has an inhalator and an approved gas mask as additional aid in resuscitation and rescue work. This equipment is available night and day not only to all departments of the company, but to the public as well.

It would be impracticable to list all of the safety methods followed by the company, but a few resulting from original ideas by employees follow:

1. Placing of "no parking" signs on company property along the right of way to reduce the possibility of accidents with automobiles.
2. Placing of crossing signs, warning both trainmen and public of dangerous points.
3. Removal of nails and tacks from all working poles on the company's system, and the taking of proper steps to prevent the use of the poles by sign posters.
4. Establishment of an electrical school of safety during the winter and spring. This was open to employees on their own time and was well attended.
5. Discouraging talking to motormen on the cars.

Establishment of Safety Council

Safety activity on the Tide Water property heads up in the safety council, of which the general manager is chairman. The personnel of this committee, with the exception of the department heads, is changed yearly. The safety council meets monthly in the general manager's office. At these meetings each member is called on to report individually. Suggestions are received, discussed and acted upon. The accident record of the previous month is reviewed. Each accident is discussed in detail. The record is compared with that of other months. The trend from year to year is noted. Causes are examined carefully, and steps are initiated to prevent the recurrence of accidents.

Since the initiation of the safety suggestion plan in 1920, and up to Dec. 31, 1926, 606 safety suggestions were submitted. Nearly all of them were found feasible and put into effect.

At the close of these meetings an inspection committee is appointed from the men present and sent out to make a detailed inspection of the property. This committee submits its written report to the safety supervisor. Suggestions supplied by the men are included in the report. The trainmen have become so interested in the safety work that they take up safety questions in sessions of their union.

Bonus Plan in Force

A bonus plan rewards trainmen for safe operation. The rewards are made on a monthly, quarterly and yearly basis. Many of the men have made perfect records and secured the maximum reward for as many as three consecutive years. Thus, in 1926, of the 48 trainmen eligible, 30 per cent held perfect records. In other words, during the year, they operated cars over the system without a single accident charged against them. Only one man on the staff failed to receive some award.

The bonus plan also extends to the bus drivers and to the regular drivers of all of the company's autos and trucks. The bonus schedule follows:

$1 for each no-accident month	$12 possible in year
$1 for each no-accident quarter	4 possible in year
$5 for perfect record for the entire year	5 possible in year
Total	$21 possible in year

If an employee has an accident, he loses his cumulative bonus but can start over again for the rest of the year.

The cost of the bonus system during 1926 was $516, or about 1 per cent of the wages paid to the trainmen.

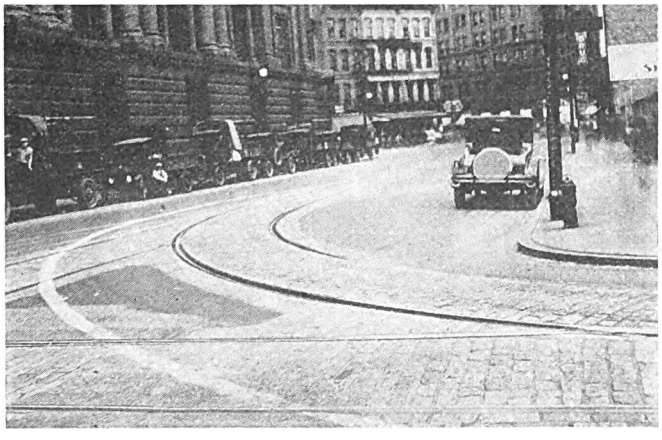
Pittsburgh Protects Passengers and Pedestrians

Railway adopts railed safety zones, extensive system of pavement marking and other means for reducing accidents to patrons and other users of the street

ON THE Pittsburgh Railways the campaign for safety is regarded as of the greatest importance. With the reorganization of the company a safety committee was formed to head up the movement, and a great many steps have been taken to reduce street accidents. Roughly, they may be divided into improvements on the car to make it more conspicuous and easily controlled, protection for boarding and alighting passengers, warnings on the street of dangerous points because of the operation of cars, and improvements in the track from a safety standpoint.

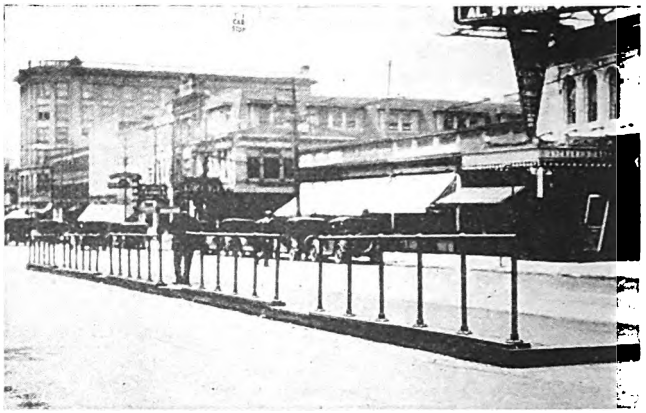
Many of these improvements on the cars were possible because during 1924, 1925 and 1926 many old cars were retired and new cars purchased. As these new cars were equipped with modern brakes and were up to date in other respects only what might be called the more unusual safety precautions will be mentioned here.

One of these was the selection for the car body of a light color, chrome-orange, instead of maroon or dark red, in order to give greater visibility. Stop lights were installed on the rears of all cars, operating from the control mechanism, so that when the car was slowing down preparatory to making a stop, the stop light was illuminated. Projecting fenders were replaced with automatic life guards. Window wipers were installed as were also rear sanders so that the motorman could sand the rails in case his car should begin to slide backward on a heavy grade. All controllers were fitted with a dead-man's attachment. When emergency stops are made, the doors of the car are automatically opened. This tends to reduce to a minimum the confusion of passengers in the event of a collision. The air brake handle has been



The distance taken by car overhangs on curves with a short radius is marked distinctly on the pavement

fitted with a device by which the operator can sand rails and apply air without removing his hand from the air brake handle. The pet-cocks on all air reservoirs have been changed so that they can easily be opened or closed from the outside edge of the car by means of a handle and cannot be opened accidentally. Automatic air brakes are applied to trailers.



This type of loading platform is used in Pittsburgh where the street is of sufficient width

The precautions for boarding and alighting passengers consist largely of island platforms which have been introduced at a number of points. Where the street is of sufficient width, a special railed platform or guarded safety zone of the type shown in an accompanying illustration, has been installed.

On two routes, there were points where there was a possibility of passengers alighting from cars and stepping directly into the path of moving vehicles on a high-speed thoroughfare parallel to the track. In one such case platforms were constructed so that passengers could alight from what would ordinarily be the wrong side of the car in order to keep them off the highway. In another case, the company has approved plans for shifting the track at stopping points so as to provide room for loading and unloading platforms.

At locations where hazards exist from the overhang of cars passing around curves, the company co-operates with the city in painting the pavement so as to indicate the extent of the overhang. This work is performed under the jurisdiction of the traffic department of the city, the company assuming the expense incidental to the employment of one painter. At dangerous car turns, a warning is painted on the street, "Watch Car Turn."

At a few points within the city where the car platforms formerly overhung the curb when the car was passing around the curve, permission was secured to cut back the curb so as to reduce the possibility of pedestrians being struck by the car. On interurban lines obstructions to vision at road crossings have been cleared away so far as was possible. The attempt has been made to give a clear view to an approaching vehicle from a point approximately 40 ft. from the car tracks and to a street car operator 400 ft. from road crossings. Where necessary, the purchase of property has been authorized to attain this result. Up to 1926 four such locations had been remedied. Block signals and automatic crossing signals have been introduced to a considerable extent on the interurban lines.

In the track the principal safety precautions have been positive-locking electric track switches and electrically operated derail switches at railroad crossings.

An article in regard to the latter appeared in the issue of ELECTRIC RAILWAY JOURNAL for June 27, 1925, page 1008. Since that time the use of these derail switches has been extended.

The purpose of the addition of the locking feature to the electric switch is to prevent "switch-splitting" during the movement of a car over the switch. It has proved successful.

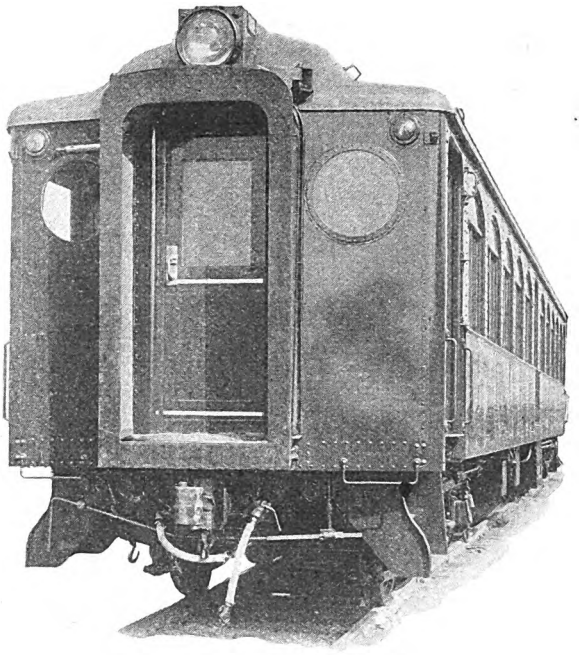
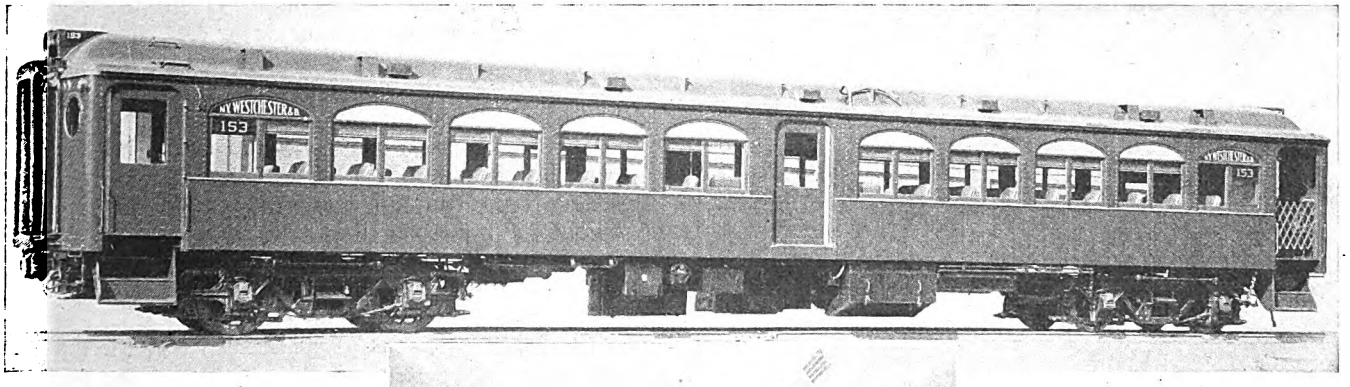
Single-Phase Equipment

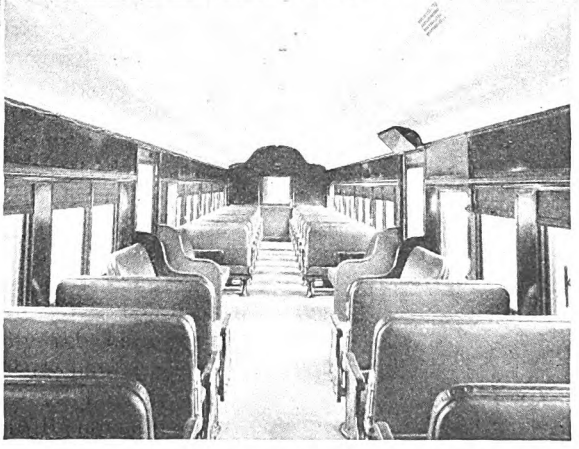
for New York, Westchester & Boston Railroad



Extension of the company's lines and increased traffic resulted in order for 30 additional cars

By Walter H. Smith
Equipment Engineer Reading Railroad*





One of the latest New York, Westchester & Boston Railroad cars

The train line and bus line receptacles may be seen in the end view directly beneath the body and inside the step line. The interior is roomy and cheerful, cross seats being used except adjacent to the door. Flush platforms are the rule except at a few little-used stations.

INCREASE in passenger traffic and extension of lines made necessary the purchase of additional equipment by the New York, Westchester & Boston Railroad, New York, N. Y. Recently three orders were placed, each for ten cars, making a total of 30. When these are all received the company will have 80 all-steel passenger motor cars and five all-steel trailer cars.

The road is a four-track line starting from the Harlem River in New York City and continuing north to just beyond Mount Vernon where it diverges into two double-track lines, the one on the west continuing to White Plains while that on the east is now being extended from Mamaroneck through Harrison to Rye. Further extension to Port Chester is contemplated in the near future. The system at present comprises 26.62 route-miles with a total of 83.10 miles of electrified track.

Following previous practice each of the new cars has two 175-hp. (hour rating) Westinghouse type 409-B single-phase, 25-cycle series motors mounted on one truck. The Westinghouse type AB (automatic acceleration, battery operated) multiple-unit control system is used, permitting a train of from two to ten cars to be operated from the master controller of any car. Usually trains consist of motor cars only, but, occasionally, during rush hours, a train of six or more cars may include one trailer.

Each car is equipped for double-end operation and each motor car has two pantographs of the sliding shoe contact type, raised by a spring and lowered by air. There is a self-adjusting action so that the shoe moves to conform to the lowest trolley wire height. Each pantograph will collect current from the trolley at 11,000 volts and is suitable for speeds up to 60 m.p.h. The gears are of the flexible type with a 25:68 ratio.

The new cars are designed to operate in multiple with those in service although the main power circuit requires only six unit switches arranged for preventive coil transi-

**Formerly railway equipment engineer Westinghouse Electric & Manufacturing Company.*

The New York, Westchester & Boston lines run from the Harlem River to White Plains and Mamaroneck, an extension being made to Port Chester

tion, whereas the power circuit on the old cars requires eight unit switches with grid resistor transition. Any two cars with different systems of control may be operated in multiple if designed for the same rate of acceleration and placed under the control of a motor current limiting relay, provided that the tractive efforts in pounds per ton at the rims of the driving wheels are approximately equal, the free running speeds are equal when the motor performance curves are reached, and the balancing speeds are equal on level tangent track. These conditions are met as the old and new cars weigh practically the same and the motors are duplicates electrically.

The high-tension cable on the roof of the car is carried on porcelain insulators. The cable leading to the main transformer is run in a metal conduit and is entirely enclosed from the roof to the casing of the transformer.

The main transformer is of the two-circuit, air-blast type. The primary winding is connected between the pantograph and the track rails and the secondary winding has suitable taps to give the required voltages for traction motors and auxiliary equipment.

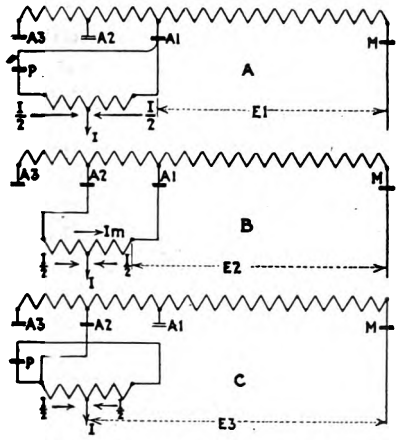
Around the cable leading from the pantograph to the primary winding is a small series transformer, the secondary of which connects to the coil of a relay which will energize the actuating coils of the pantograph "down" magnet valves, if there is excessive current in the trolley cable such as would be caused by a short-circuit or ground. Then the pantograph on the affected car will be lowered automatically after power has been cut off from the line by the opening of the transformer station breakers. The relay disconnects the "trolley-down" magnet coils from the control train line and energizes them directly from the storage battery which makes it impossible to raise the pantographs again until the relay is reset manually to its normal position. The relay does not operate under normal overload conditions. Its function is to clear the line after a break-down has occurred.

The main power circuit requires but a single preventive coil for transition from one tap on the transformer to another during acceleration. The coil consists of a laminated, iron structure assembled around a winding and clamped between cast end frames. Its middle point connects to the traction motor circuit and the end leads connect through the switch group to points on the secondary winding of the main transformer. It is possible to secure five accelerating points with four unit switches. The circuits are so arranged that each half of the preventive coil is required to carry one motor current on all accelerating and running points. In the accompanying partial schematic diagram showing switches *M*, *A1* and *P* closed on the first point it will be seen that the current is divided equally between the two halves of the preventive coil, neutralizing any choking effect. This connection will give a voltage on the motors from *M* to *A1* on the transformer. If the current at start is *I*, then the current in each half of the coil will be *I/2* with no magnetizing current in the coil and consequently no iron loss.

In switching from one point to another, acceleration switch *P* in Section A of the diagram must be opened before switch *A2* in Section B is closed. During the time from the opening of *P* until the closing of *A2*, the entire motor current must pass through one side of the coil only, and unless the coil is properly designed there may be a considerable choking effect. A properly designed coil, however, minimizes the choking and since the changing of switches may be made to take place in some four cycles the effect is negligible. In passing to this second point with switches *M A1*, and *A2* closed, the voltage across the motors will be *M-A1* plus one-half *A1-A2*. The current in each half of the coil will still be *I/2*, but superimposed on these two currents on this point is the magnetizing current I_m of the coil necessary to produce a voltage equal to that between the transformer taps *A1* and *A2*.

It will be seen in passing to the third point, shown in Section C of the diagram, that it first will be necessary to open switch *A1* before reclosing *P* for the second time. While this switching is taking place the entire motor current again must pass through one-half of the coil for an instant, after which the current in each half of the coil will be one-half with no magnetizing current. The voltage on the motors on the third point will be *MA2*. The transition to other points is a repetition of the above. On the fifth or final running point there

Digitized by Google



Partial schematic diagram of power circuit, showing use of the preventive coil

is no magnetizing current in the preventive coil. This arrangement provides maximum efficiency during both acceleration and running. The six electro-pneumatically operated unit switches required are assembled in a group on a common frame enclosed by sheet metal covers. The individual switches, blowout coils, actuating air cylinders and magnet valve brackets may be removed independently. Included with the switch group and mounted on the end frames are one sequence switch, one current limit accelerating relay, two overload relays, and two individual motor control cutout switches.

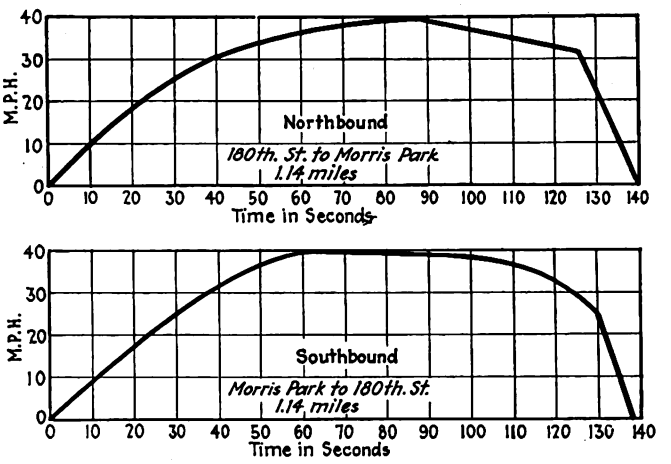
The current limit relay determines the rate of acceleration of the car. It controls the movement of the sequence switch drum which, in turn, regulates the closing and opening of the individual switches for proper acceleration. The rate of acceleration may be changed by changing the relay setting.

Incorporated with the current limit relay is also a shunt coil which, if energized by cutting out either of the traction motors, automatically gives a reduced relay setting and the car may proceed with the remaining motor but with reduced acceleration.

The sequence switch controls the closing and opening of the unit switches in the proper order for acceleration. It also makes possible positive interlocking of the control system used on these new equipments, which provides against closing of two conflicting switches at the same time. The closing circuit of the incoming switch is interlocked through the "out" position of the outgoing switch, as distinguished from negative interlocking in which the holding circuit for the outgoing switch is opened by an interlock in the "in" position of the incoming switch.

Reversals Interlocked

The single reverser is interlocked with the power circuit so that the switches cannot be closed and power applied to the main motors unless it is in its correct forward or reverse position as indicated by the master controller. It also cannot be thrown while power is on the motors. The reversing drum is rotated by two air cylinders, compressed air being admitted to either the "forward" or the "reverse" cylinder by two magnet valves. The reverser is suspended from the underframing of the car body between the switch group and motor truck so as to provide for the least amount of cable wiring for the main motor circuits.



Typical speed-time curves, showing performance of the cars between Morris Park and 180th Street in both directions

Each car has two drum-type master controllers, one at each end. Moving the handle to the right causes a forward movement of the car and moving it to the left a reverse movement. If the motorman's hand is removed for any cause the handle will return to the "off" position and cut off power.

Each controller also has a control cutout and reset receptacle. The drum for actuating the control train-line wires cannot be energized unless the cutout plug is inserted in the receptacle. This plug cutout is also used for resetting the overload relays through the reset receptacle.

Two push buttons in each master controller actuate magnet valves which govern the admission of compressed air to the cylinders which unlock the pantograph and allow it to be raised to, or lowered from, the running position. The unlocking button has an automatic release, but the lowering button will remain closed until released manually.

The control and air brake train-line circuits between cars are made by jumpers and two twelve-point receptacles mounted at each end of the car. This permits coupling of the train line from either side of the car and without regard to ends. All of the control train line wires are run in one conduit. Three junction boxes provide for the train line and for connections to the individual pieces of apparatus. The train line jumpers are carried in dummy receptacles when not in use.

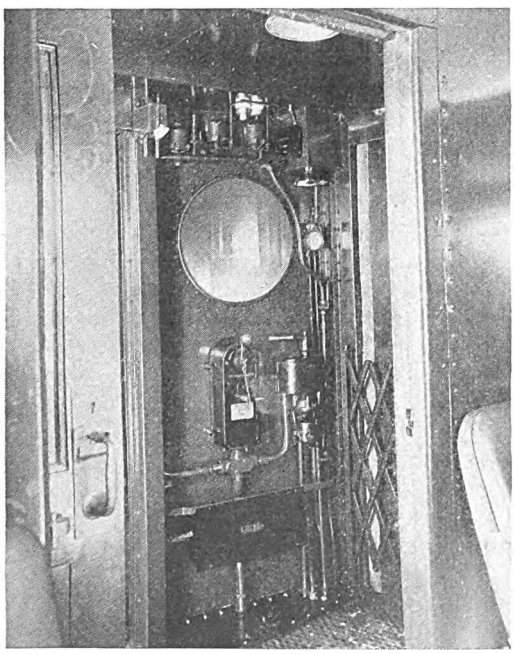
apparatus, the air brake apparatus and the emergency lighting system is taken from a motor-generator set and storage battery at from 32 to 40 volts. The storage battery consists of 25 cells of the Edison B-2-H type connected in series and floating across the motor-generator set when it is running. The battery is rated at 37½ ampere-hours at its normal rate of discharge.

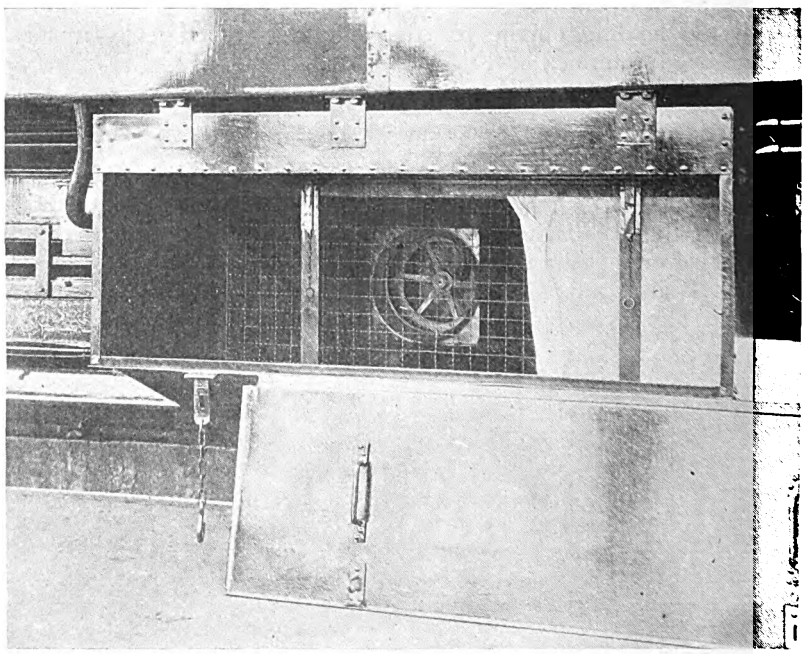
The motor-generator is semi-enclosed, self-ventilated, and equipped with two ball bearings. The motor is a two-pole, three-phase induction type with a cage rotor, which operates at 110 volts on a single phase. The set is brought up to speed automatically from the d.c. end with current from the storage battery. The generator is a four-pole, shunt-wound machine with two brush arms. A suitable rheostat adjusts the field excitation to give proper voltage on the battery and other apparatus. A battery cutout relay energized from the motor circuit connects the battery to the generator when the transformer is alive and the motor-generator cutout switch is closed. It also disconnects the battery from the generator upon loss of line potential, lowering of the pantograph or cutting out of the motor-generator set.

Duplicate Lighting Systems Installed

The lighting system of the car consists of ten main lamps and ten emergency ones alternating in one row in the center of the car. The main lamps are on a 110-volt circuit supplied from the main transformer, while the emergency lamps operate on the battery at from 32 to 40 volts. The emergency lamps are cut in automatically upon loss of line potential. In addition, each end of the car has two vestibule lamps, two marker lamps, one gage lamp, one headlight, and one car number lamp. All of these are fed from the motor-generator and storage battery.

The ventilating system for the equipment consists of a single inlet over-shot wheel blower, driven by a single-phase series type motor. The wheel is a 15-in., 1,500-





The control compartment of the car indicates the simplicity of the equipment which the motorman must handle. At the right is shown the air intake to the ventilating system. The snow screen is partly in place

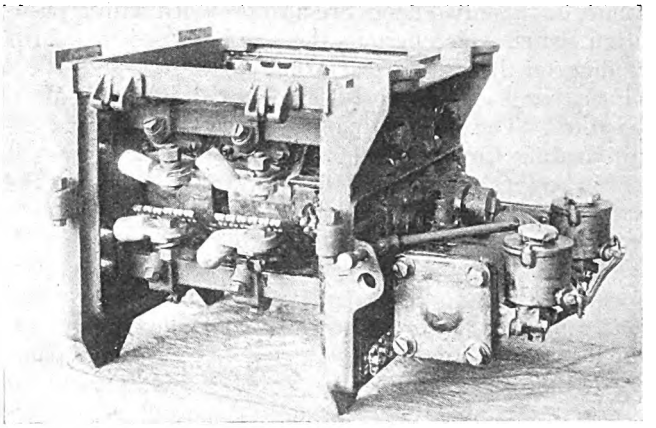
The electromagnetic brake valve. The cover is opened to show the control contacts

r.p.m. Sirocco runner. The blower unit is behind the main transformer toward the trailer truck. The intake is a large sheet metal box on the underside of the car body. It has a snow barrier which is readily thrown in place. The blower wheel casing is bolted to the underside of the channel box center-sill of the car body. The ventilating air to the transformer is blown directly into the transformer casing, while that for the motors is transmitted through the center sill to the motor truck where there are outlets to the motors. These outlets are provided with curved deflectors. The connection from the center sill to the motors is made by means of flexible oil-treated canvas bellows suitable to allow for the maximum truck swing. The ventilating air to the preventive coil is taken from the center sill.

Length over coupler faces	72 ft. 0¾ in.
Length over buffer face plates	72 ft. 7½ in.
Length over body corner posts	61 ft. 4½ in.
Length center to center of trucks	47 ft. 7½ in.
Wheelbase	8 ft. 0 in.
Wheel diameter (motor truck)	42 in.
Width over side plates	9 ft. 7¾ in.
Height of car from top of rail to top of roof	13 ft. 3½ in.
Seating capacity	80
Weight fully equipped	125,000 lb.

The cars are all steel with full vestibule platforms and center side doors. Flush type station platforms are used on this road, but in order to permit the cars to be operated over a section of the New York, New Haven and Hartford Railroad with low station platforms, the usual coach type steps with trap doors are installed at the ends. Some of the principal dimensions of the new motor cars are given in the table above.

The body underframe consists of continuous rolled steel channels and pressed steel cross members. The center sills are two 8-in., 16¼-lb. channels spaced 14 in. back to back and having a continuous top cover plate securely riveted in place. A bottom cover plate extending from the blower unit to the motor truck completes the ventilating duct to the traction motors.



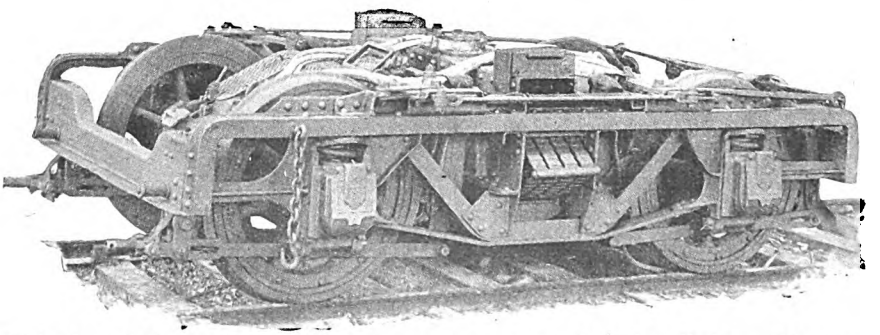
The reverser is air operated and changes all circuits for reversal of motion

Each side sill is a 7-in., 12¼-lb., rolled channel. The vestibule end sills are formed of pressed and rolled members with a ¼-in. cover plate, riveted together and also to the center sills. The body end sills are pressed steel members framed to center and side sills and with both top and bottom cover plates. Single and double cross bearers of pressed flanged diaphragms with cover plates are riveted to the center and side sills. The diaphragms are perforated for air piping and conduit. The diagonal bracings are pressed and rolled members riveted to gusset plates framed to the center and side sills at various points. The body bolster is composed of pressed flanged diaphragm and top and bottom cover plates. A cast steel filler is fitted and riveted between the center sill channels to support the center plate.

The side frame of the car is in the form of an eleven-panel truss, 7 ft., 5¼ in. in height. The bottom member is a 7-in., 12¼-lb., rolled channel. The posts, diagonals, letter board, and top plates of each section are pressed in one piece and the different sections are either welded or riveted together. Channel shaped window posts extend from side sill to deck sill. The side sills and side plates are reinforced across the door opening by special pressed members. There are twenty intermediate posts of pressed steel, which extend from side sills to side plates. The main posts and diagonal braces are riveted to the 7-in. channel side sill.

The Auxiliary Equipment

All the doors are of the sliding type. The vestibule and center side doors are remotely controlled, being opened and closed by National Pneumatic Company Type GS-8E air engines. The center side doors may be opened and closed from either end of the car. The control



This view of the truck shows the extreme compactness of the installation. The truck at the opposite end of the car is a trailer

Digitized by Google

circuits of these two doors are also provided with a push-button switch which permits them to be closed by guards standing on the station platforms.

Each car has ten ventilators, located in the roof in two rows. The car heating system consists of 36 Gold Car Heating Company type 405-E, 600-watt, cross-seat electric heaters and two 1,000-watt vestibule heaters. The heaters are of the two-coil type, the main car heaters having one coil with 200-watts capacity and one coil with 400-watts capacity. Nine heater coils are connected in a series. Energy for heating is supplied from the main transformer at 112 volts and is controlled by cutout switches located in a cabinet provided at the motor truck end of the car for the control switches and fuses of all auxiliary apparatus. Each car also has a two-circuit bus line for supplying energy for heating and lighting when the service requires trail car operation.

The brake equipment is the Westinghouse Air Brake electro-pneumatic, schedule AMCE. Brake action is positive at all times, for if the electric control fails the pneumatic control functions without further direction on the part of the operator. Electric control effects an economy in air consumption, necessitating only a comparatively small compressor. The compressor is the XD-2-EG, having a displacement of 25 cu.ft. per minute. The motor is supplied with current from the main transformer at 112 volts. The system is synchronized, so that in train operation each compressor performs an equal share in the work.

The control valve embodies all the modern operating features, chief of which are quick recharge of the brake system, high pressure in emergency, positive and uniform service action and simplicity of control. The control valve automatically performs these functions under the simple guidance of the brake valve, which is a standard rotary valve type with the addition of a suitable electric portion.

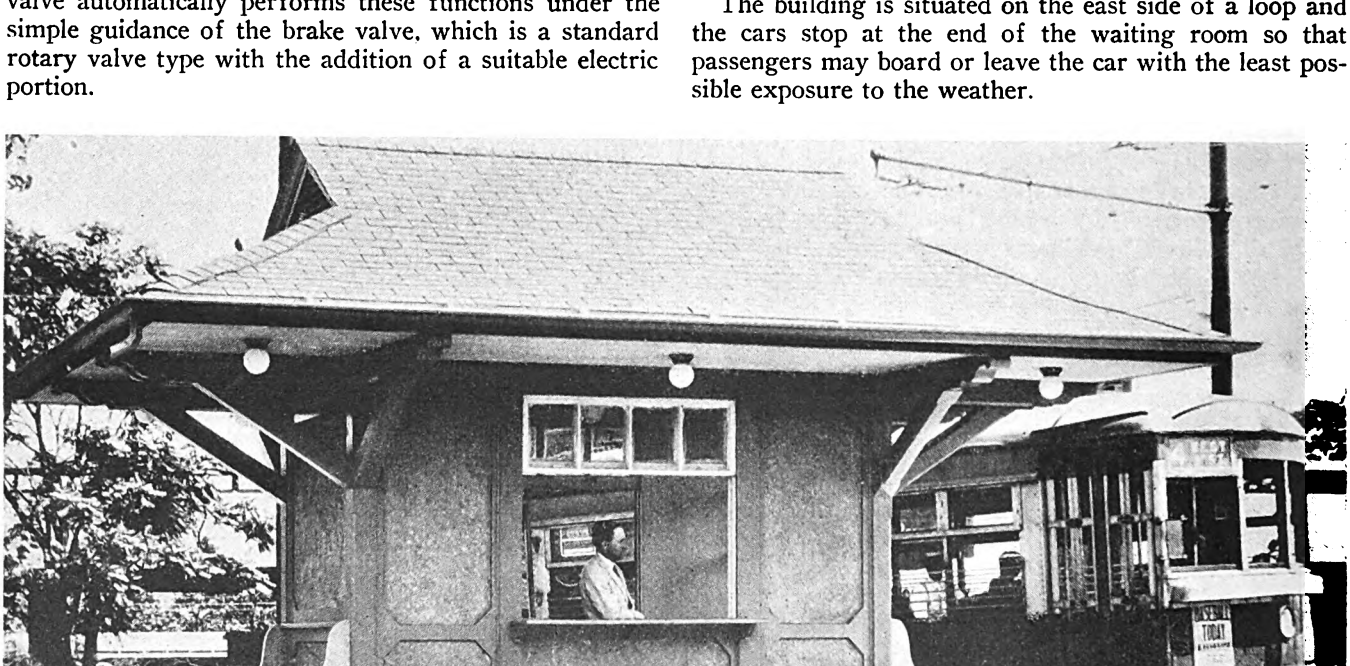
$1,000 Erects Attractive Station at Little Rock

FOR the convenience of passengers at the Rock Island railroad station at Little Rock, Ark., and the people living and working in the vicinity of that station, the Arkansas Power & Light Company has built a combination waiting room and news-stand at the end of its Rock Island street car line. It is the first of several stations of that type which the company plans to build in the loops of other lines. The construction cost was approximately $1,000.

The station is of stucco and frame and is simple but artistic in design. It measures 6x12 ft. and is approximately 15 ft. high. It has a concrete base 16x22 ft. On the exterior of the building there is a sales booth which has been leased as a newsstand for $15 per month, which is regarded as a satisfactory return on the investment. However, in making the agreement, the company provided that the tenant's first duty was that of service to the company and that he should act as its passenger agent at that point. This means that he must be informed on the railway schedules and be courteous to all patrons of the line, as well as sell tokens at the usual rates. He is permitted to store baggage, for which a nominal fee may be collected.

Seats are placed at either end of the building for the comfort of waiting passengers. The waiting room furnishes protection from the weather for passengers, who formerly waited at the railroad station across the street and then were forced to run to catch the car or else take chances on getting wet in bad weather.

The building is situated on the east side of a loop and the cars stop at the end of the waiting room so that passengers may board or leave the car with the least possible exposure to the weather.



The first of a series of combined waiting room and news-stands, erected at the end of an important line by the Little Rock company

Maintenance Methods and Devices

Oil Is Superior to Grease for Gear Lubrication

By H. S. Williams
Assistant Superintendent of Equipment Department of Street Railways, Detroit, Michigan

MUCH attention has been given to the subject of gear lubrication and the question as to which is the better medium, an adherent or tacky type of grease or an oil. The present construction of gear cases is such that oil cannot be retained as a lubricant. In fact, it is often difficult to prevent the loss of heavy greases. However, the incentive toward developing an oil-tight gear case depends on whether the oil used is superior to grease for this type of lubrication.

With the idea of determining which lubricant is superior for ordinary spur gearing of railway motors some tests were made. Having the test apparatus at hand that was used for the noise reduction committee's study, it was easy to run a series of tests to determine whether there is any difference in the resulting efficiency when grease or oil is used for railway gearing. The test consisted of driving a generator by means of a motor. By measuring the input and output at various speeds, the efficiency was obtained. The efficiencies shown are very low as the generator used was of ancient type. The test was run first with grease, then the gearing was cleaned and the test repeated with oil. The results obtained are thus comparable, as all other conditions except lubricants were identical.

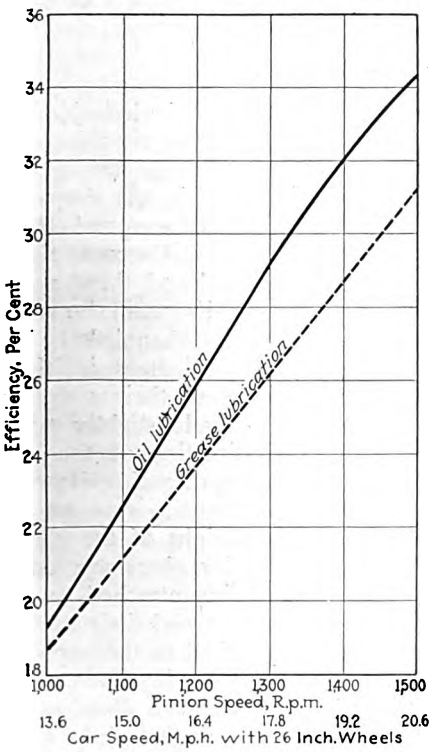

Fig. 1—Temperature rise of gear with oil 5.83 deg. C. With grease 10.35 deg. C. Time for each temperature test 50 minutes.

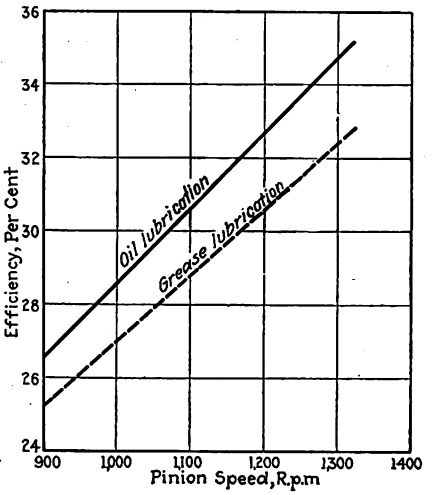

Fig. 2—Comparison of efficiency at different speeds for oil and grease lubrication.

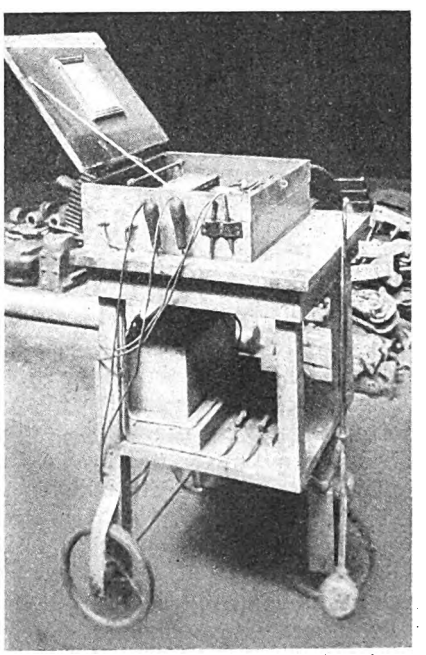
The accompanying graphs show the results. A first test, shown in Fig. 1, was quite conclusive, but desiring to be absolutely sure it was decided to run a check test. In the second test the generator was replaced with another type, so the over-all efficiency is not the same as in the first, but the relative results are similar. Attention is also called to the corroborative evidence given by the temperature rise that was obtained in the first test.

From these tests I believe that proof is established that oil is much the superior type of lubricant. It is a simple matter to figure back from these data and see approximately what it costs to stick to grease as a lubricating medium. The word "approximately" is used advisedly because, as pointed out before, the present gear case invites the entrance of grit and dirt, so if energy loss is figured correctly there is still the element of gear life to be added.

It is my firm belief that gear cases of the future must be made oil tight. With the present tendency toward new design of motors, this can be accomplished quite readily.

Portable Electrical Testing Machine

FOUR portable testing machines mounted on rubber-tired wheels are used by the Georgia Power Company, Atlanta, Ga., for detecting poor connections, improper winding of fields or short-circuited turns and to determine which fields need to be removed and repaired. This testing machine, which was described in the brief of the company submitted in competition for the Coffin Award, has proved of great value in reducing detentions to service and increasing the efficiency of the electrical equipment. Necessary parts are mounted on two platforms of the framework. Covers provide easy access, while they protect the equipment and keep it dust-proof.



Field testing equipment

This machine has been a large factor in reducing armature and field troubles. The following information shows some of the beneficial results:

Location of trouble	1922	1923	1924	1925	1926	First Four Months 1927
Armature	260	280	187	147	64	17
Field	141	98	85	75	23	0

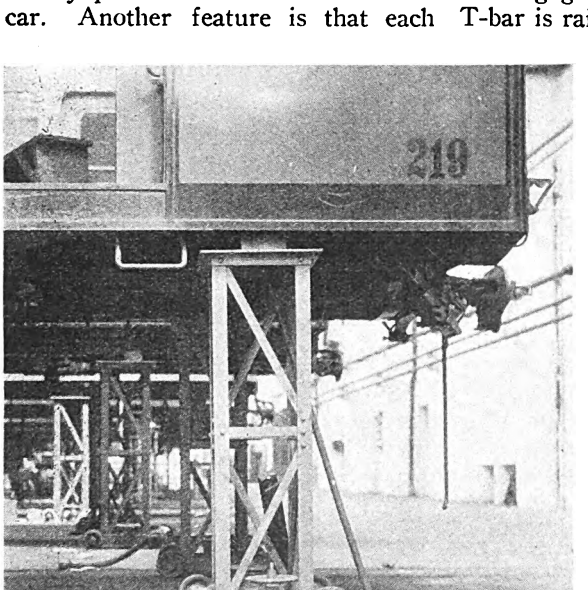
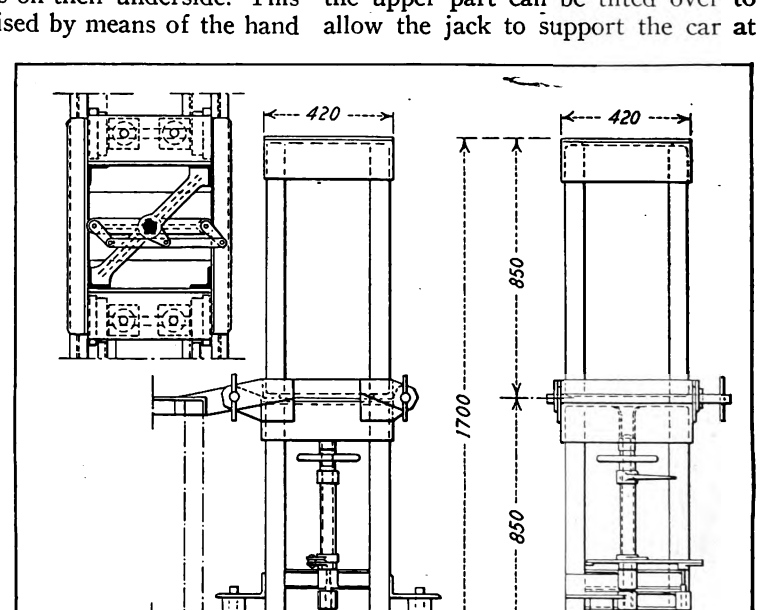
Support for Car Ends in Overhaul Shop

SUPPORTS of an ingenious type for the ends of cars while they are being overhauled have been developed by the Elevated & Underground Railway of Berlin, Germany. A feature of the design is that there are no cross girders or braces between the two supports at each end of the car. Hence, there is no obstruction to prevent a workman from getting at any part of the underside of the car. Another feature is that each corner support can easily be moved in the direction of the side sills of the car. This makes them very easily adjustable to various lengths of car, and when not in use they can be rolled back out of the way against the wall or center posts of the building.





At left—This movable support can be locked in position and the weight taken off the wheels when it is used to support a car body. At right, recent modifications in the same support, as developed by the Elevated & Underground Railway of Berlin. The dimensions are in millimeters

The design shown in the accompanying half-tone was the form used at the time of the visit of a representative of the ELECTRIC RAILWAY JOURNAL to the repair shop of the company during the latter part of May, 1927. As will be seen, the support is built of structural steel and is mounted on four small wheels which run on tracks extending from the side wall to a short distance under the car. The structure is 15¾ in. square and 5 ft. 7 in. high. The rails on which it runs are formed of two pairs of I-beams separated by a distance slightly more than the thickness of the wheel flange.

To prevent the heavy weight of the car from coming on the wheels and axles the latter are set in eccentrically arranged bearings so that when the support is in its proper position the wheels with their axles can be moved with a lever off the floor, allowing the support to rest solidly on the girder rails. It is then locked in this position by means of an inverted steel T-bar whose shank passes through the slot between the I-beams and engages on their underside. This T-bar is raised by means of the hand wheel shown in the illustration near the base of the support. The T-bar clamps the support rigidly in position. A wooden block is placed on the top between the support and the side sill of the car, as shown in the illustration.

Since the visit of a representative of this paper to the repair shop of the Elevated & Underground Railway in Berlin several improvements have been made in this jack, according to a recent issue of *Verkehrstechnik*. The improvements are protected by German patents. In this later design the lever for lifting the wheels and axles out of the way when weight is put on the support is eliminated. Instead, spiral springs are placed directly above the wheel journals in a closed cylinder. The strength of these springs is such that the weight of the support alone does not depress them appreciably; that is to say, the support alone can be moved freely on its wheels. If, however, the car weight rests upon it, the springs are compressed so far that the bottom of the support automatically comes to rest on the floor. The locking arrangement has also been simplified in that a lever half way up on the support is arranged to turn the inverted T-bar through an arc of 90 deg., and a spindle and hand wheel locks it against the underside of the I-beams. Still another change made is to build the support in two parts hinged together so that the upper part can be tilted over to allow the jack to support the car at a lower height. This is desirable for certain operations, like replacing the side panels.

Besides their use in the shops of the Elevated & Underground Railway in Berlin, the German State Railway has introduced these movable supports in its new shops in Niederschoneweide-Johannisthal, but has made a few changes in their design. To increase their stability, they have been made slightly trapezoidal in the direction of the car. Instead of spiral springs for allowing the support to come to rest on the floor when the weight of the car is put upon it, leaf springs are used, the two axles being attached to the ends of the springs and their middle points being attached to the support. When the support is loaded the springs become flattened, allowing the support to rest on the girders, as before. The locking arrangement is similar to that in the Elevated & Underground shops.

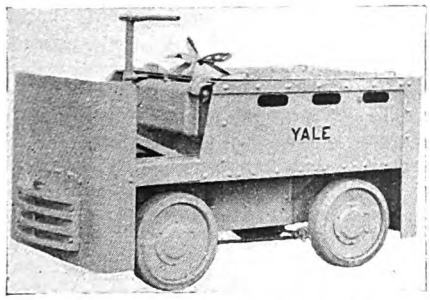
New Equipment Available

Heavy Type Electric Tractor

MODEL K24C tractor with four-wheel drive has been brought out by the Yale & Towne Manufacturing Company, Stamford, Conn. The machine is capable of an ultimate drawbar pull in excess of 4,000 lb., depending on road surface conditions, and will operate at a continuous drawbar pull of 1,000 lb. without danger of overheating. By driving all four wheels of the machine, it is possible to get the maximum of traction with the given overall weight of the machine. This feature is of particular advantage when the tractor is used to drive outdoors between buildings or where ice and snow are encountered.



New type of Yale electric tractor

The machine is fitted with four-wheel brakes, which operate through the differentials, so that they equalize properly regardless of the conditions of the lining. The spring, which automatically sets these brakes when the operator either releases the pedal or steps off the machine, is connected directly to the brake shoes so that any disarrangement of the linkages between the pedal and the brake lever would in no way hazard the driver of the machine. Should the linkage fail, the brakes would be set immediately and warn the driver that something is wrong.

The brake pedal is large, so that it is possible to rest both feet comfortably on it. The pedal lies flush with the wooden flooring of the tractor. By a suitable arrangement of toggle joints, the pressure required to start the pedal in the release or downward direction is greater than that which is required to hold it down once it has been depressed. To cut off power and apply the brakes, the pedal is allowed to rise. Should the operator leave his machine at any time or fall from it, the brakes would be set automatically.

Steering is through a rugged handle so arranged that it may be folded up out of the way if the driver wishes to leave the seat. Each of the steering knuckles on all four driving wheels is equipped with a ball thrust bearing which lightens the steering, permitting the driver to switch his machine quickly when in tight places.

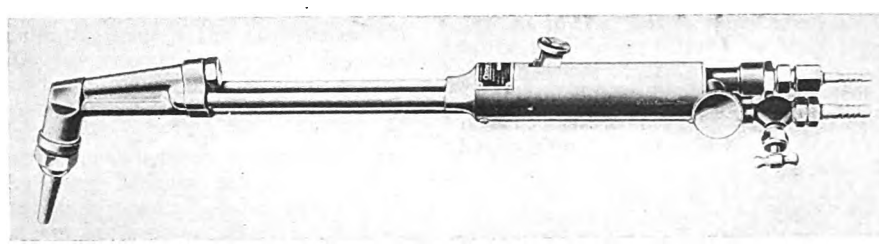
The driving mechanism consists of two standardized units connected parallel to the controller. The machine is furnished regularly with a 48-volt motor and a 23 to 1 gear ratio. The frame is unique in that the pressed steel guide members or main supporting members are integral with the axle yokes. This gives the frame a depth of 18 in., making it fairly capable of standing jolts and jars in addition to the usual bending stresses to which it is subjected. The bumpers are made of ½-in. plates and a triple bumper casting front and rear gives a range of coupling heights that will meet practically every requirement.

Improved Cutting Blowpipe

COMPLETE assurance against backfire, even under the most severe operating conditions, is claimed for a cutting blowpipe, known as type C-14, which has been added to the line of the Oxweld Acetylene Company, New York, N. Y. This blowpipe uses the same nozzles as the Oxweld type C-2, which it resembles; although several improvements in design have been made. The three gas tubes are straight, having no bends either outside or inside the handle. The cutting valve is of the same design as has been used on the type C-6 for many years and is now used on all hand-cutting blowpipes of the same make.

Some time ago the small needle valve bodies used for acetylene on the cutting blowpipes were improved by making them pressure forgings. Now, in addition to these, both the head and the rear body of the type C-14 are pressure forgings, instead of plain castings, giving better appearance, increased durability and lessened weight.

Interchangeable nozzles are provided so that the blowpipe may be used with either medium or low pressure acetylene. Obviously the medium pressure nozzle cannot be used with low pressure acetylene, but the low pressure nozzle can be used with a medium pressure acetylene supply if low pressure is maintained in the hose and blowpipe. To accomplish this, the regulator should be adjusted to give a flame showing an excess acetylene cone not more than 1 in. long when the acetylene valve on the blowpipe is wide open. The acetylene valve should then be adjusted to obtain the neutral flame.



Oxweld type C-14 cutting blowpipe

Light Steel Wheel

LIGHTNESS and strength are characteristics claimed for a new steel wheel for light trucks placed on the market by the Dayton Steel Foundry Company, Dayton, Ohio. It has the typical Dayton hollow-arch spoke construction, integral hub and felloe. It is cast in one piece from electric furnace steel. The spokes cannot loosen and flats, causing the wheel to wobble and decrease the life of the tire, will not develop. Metal is distributed so as to avoid localization of stresses. The wheels, cast in one piece, are machined at one set-up. Bearing bores, brake drum pilot and tread are concentric.

Advantages of High-Speed Railway Motors*

By N. W. Storer
Railway Engineer Westinghouse Electric & Manufacturing Company

SPEED is purely a relative matter. A motor in one generation may be considered high speed, while in another it would be low. The early double-reduction gear motors were dropped because they were of the bipolar type, were unprotected, and drove through poorly-cut or uncut gears. The noise was intolerable. The armatures were hand wound and commutation was bad. The single-reduction motor was radically different in almost every respect, having a slotted armature with form-wound coils, protected by the motor shell, and with only half as many gears.

Now, after an interval of nearly 40 years, we have the reappearance of the double-reduction gear in the form of a separate gear unit, the W-N drive, which permits a very high speed. The modern motor with single reduction and low wheels has about the same armature speed as the old double-reduction motors, so that the latest double reduction gives a speed unprecedented for street railway motors.

High-Speed Motor Troubles

The principal causes of trouble with the high-speed motors in the past have been commutation, broken armature leads, armature windings, rapid brush and brushholder wear, and short bearing life.

Bad commutation may be caused by poor compensation—the motor may be compensated for heavy loads and saturated fields as frequently happens in order to make a good showing on test. As a matter of fact, probably 90 per cent of the flashovers occur at high speed and light load. If the motor is fully compensated for heavy loads, it will be over-compensated at light loads when a very little sparking is likely to cause flashing. It should be compensated for higher speed and a little more sparking tolerated at heavy loads.

Flashing may also result at light loads, due to armature reaction causing a high distortion of the field under the pole pieces on account of the lack of saturation. Another fruitful source of flashing is poor brush contact between the brushes and the commutator resulting from rough commutator, bad track, worn gears and bearings, or unbalanced armatures. Anything that can cause a brush to jump or vibrate is likely to cause flashing. One of the best safeguards against flashing due to brush jumping is to use four brush-holders.

Obtaining Good Commutation

Other things being equal, a larger number of commutator bars will cut down the maximum volts per bar and will help, if not accompanied by too narrow bars. The old standard street car motors with commutators 9 in. to 11 in. in diameter were comfortably rated at 600 volts. There was room for an adequate number of bars and for distance between brushes. Decreasing the commutator diameter to 8 or 9 in. as was done in the present standard single reduction motors, cuts the distance between brush holders to about the minimum safe distance for 600 volts in street car motors.

It is well known that an economical 1,500-volt motor can hardly be built for a rating under 250 hp. Hence, it is the universal practice when smaller motors are required for operation on this voltage, to wind them for half line voltage and connect two motors permenently in series. It makes a much more economical equipment and gives entirely satisfactory results.

For the same reason, it is good practice to connect two small high-speed motors permanently in series for 600-volt operation. Commutator diameters of from 7 to 8½ in. are about the maximum that can be used for the 35 to 60 hp. sizes. Such diameters on 600 volts will have practically no margin. If wound for 300 volts, the margin for good commutation and elimination of flashing will be very large. Other advantages that go with the 300 volt winding are a larger armature conductor and fewer turns per coil, both tending towards a more rugged construction, longer life for both brushes and commutator, better insulation, less chance for breaking leads, and last but not least, a larger output for a given size of motor.

The increase in output due to winding these small high-speed motors for 300 instead of 600 volts amounts to about 10 per cent and is due to the better space factor of the windings; that is, on account of the smaller number of turns and the consequent smaller space required for insulation. It must be understood that while the motors are *wound* for 300 volts, they are *insulated* for 600 volts. The insulation to ground and the creepage surfaces should be the same as for 600 volts. A motor so constructed will be rugged and reliable, and should be free from the troubles that have been heretofore experienced with high-speed motors.

Practically the only objection that can be raised to this is the possible greater wheel slippage, but since the tendency at this time is altogether toward four-motor equipments with all weight on drivers, there is no difficulty to be found or experienced from this source. The 300-volt motors in service on the cars with worm gear drive and differential axle have given no trouble whatever from this source in spite of the greater possibility of slippage with differential axles. Accelerations of 4.27 m.p.h. per second have actually been measured with one of them. The motors with double reduction gears and solid axles should have a still larger factor of safety in this respect.

There is an additional advantage in the equipment from the operation of two motors connected permanently in series, as it permits the same control equipment as used for a two-motor equipment of the same total capacity.

Many Desirable Features

What is to be gained by the use of the ultra high-speed motor? It has several very advantageous features as applied, most of which are due to the mounting.

1. The motor weight is carried entirely on the truck frames or car body, so that the dead weight of the motor is entirely removed from the axle, and a great deal of punishment is thereby eliminated from the motors. The axle-hung motor suffers severely from the vibration communicated to it from the roadbed. The vibration is a serious source of commutator and brush holder trouble and of broken armature leads. There is little doubt that it also helps to crystallize armature shafts. Much of this trouble will be eliminated in an all-spring-supported motor. The track life will also be improved in proportion as the dead weight is removed from the axles.

2. The high-speed motor is so small that a smaller wheel is possible when used with the double reduction gear unit. This permits a lower floor car to be used with a single step between the street and the car floor. It will do away with the ramps and permit a floor of one level throughout. It will speed up loading and unloading materially.

3. The high-speed motor equipment offers a substantial reduction in weight over the standard single reduction equipment. This may not show a corresponding decrease in energy consumption. However, the difference will only be a small amount either way and will not have much influence.

Abstract of a paper presented at the midwinter meeting of the New York Electric Railway Association, New York, N. Y., Jan. 31, 1928.

Keep on the Move or Die*

By Lucius S. Storrs
Managing Director American Electric Railway Association

IN ALL matters affecting the individual's business contact with his fellows the last ten wonderful years have brought about a complete change in the daily routine. The perfection of local and long-distance telephone connections, the multitude of personal transportation vehicles on the streets, and the general celerity with which all our business and social affairs are conducted, have brought about a state of mind, or perhaps of nerves, that makes each of us impatient of delays. We rush from home to work, from office to office, from point to point in our factories or stores. We rush to the theaters, night clubs or other entertainment and are loath to take the time for leisurely movement.

When we are confronted with traffic jams and delays in our trips through the cities we are more or less complacent if we are using our private autos, or even taxicabs, for we have within our personal control the matter of speed once the jam breaks and we get under way. But if we are caught in such a delay in a public vehicle, our impatience becomes intense and we become fearful that we will never reach our journey's end. That nebulous, intangible but none the less active force, public opinion, is working against the poor old street car. No matter what the facts may be, the public is convinced that there is no slower way of getting about than by using the street car.

Doubtless all of us have taken auto trips through cities in which the other fellow is responsible for the street car service and we have been caught in traffic signal delays with a street car just ahead. How often have you thought that traffic movement could be expedited greatly in that other fellow's city if he only had equipment capable of quicker acceleration, or a better arrangement of loading zones, or something else that would let you in your auto get by his street car.

Delays there will always be. They cannot be eliminated; but they are going to be vastly changed as we get to know more about how to handle traffic. One of the great irritants to the public in traffic congestion is the leisurely street car of the old style, that is always being caught in the rear of the procession and adding to the congestion. The newer type, quickly accelerating, rapid moving, car, is up in front of all signal-delayed traffic, and when the signal changes it is off and away before the automobiles get into second speed and is sure to beat them to the next corner. You can be sure the auto driver in a town where such cars are operated knows that the street cars are fast. He is reasonably certain that he will not waste any time in using the cars instead of his auto.

Don't forget that the auto driver is going to be a trolley rider one of these days—but you can't just wish him onto the car. You have got to offer him something he will at least be willing to use, to say nothing of something he will be anxious to use.

This matter of speed isn't just a hopeless ideal. In one city I have tried going by both trolley and taxi to a hotel some two miles from the business center. The streets there are wide enough amply to provide for the traffic, and the street car has won more times than it lost. Autoists in that city give the rails a wide berth if there is a chance of a trolley car coming along.

It can be done, and it is being done! But, relatively, so few managements as yet have the vision of speed possibilities that I am fearful that passenger traffic will be congesting the airways before there is a general realization of the possibilities of the electric railway cars.

Many of the most careful students in our industry have come to the conclusion that only so-called "necessity riding" is left for the street car. I would like to have their definition of "necessity riding." Surely it is a flexible term. Logically, the volume of such use of the cars depends very largely if not entirely on the type and quality of the service offered. But granting a minimum use of the cars as "necessity riding," then there is now, and will increasingly be, a maximum use that will be determined solely by the service characteristics.

There are electric railway managements that are firmly convinced that the service requirements of their territories can be fairly met with motor vehicles. Analysis shows that the street car service is being performed with the identical vehicles that were in use twelve years ago—same trucks, same motors, same bodies, same men, same methods. The only thing that is not the same is the number of passengers carried. Is it any wonder that the new automotive vehicles, with the new ideas and methods, appeal to public and management alike? But there never will be the same net as there was in the old days, no, nor as there could be in the near future, if some of the new ideas and new money were to find expression in the street car phase of the business. Ideas have got to move as well as street cars!

The amazing thing to me is that our own people cannot see the thing in its true proportions. They keep holding back and will not buy new cars or recondition older ones because the revenue is down and people don't use the cars. People don't use the old things because they were in use back in the dark ages—a perfect circle of can'ts and won'ts; no one getting anywhere except the railway, and that is getting broke.

And yet there are bright spots where an entirely different treatment has been given to the problem, where there is the greatest optimism in the management. There is on a number of properties a willingness to provide the best service possible with new equipment and new ideas preceded by a demand for higher rates. It is needless to say that higher rates were granted, and that by a complacent public. The maximum effect of high rates is possible only where the public's approval is obtained in advance of commission authorization.

Traffic Lights Relieve Congestion*

By R. W. Emerson
Vice-President and General Manager Cleveland Railway

INSTALLATION of traffic control signals should always follow studies to determine, first, the necessity or desirability of making the installation, and second, the settings at which the signals should operate after installation. Signals should be installed only if the traffic movement will be improved by their presence or where safety cannot be otherwise provided. In Cleveland, an investigation is made to determine the number of vehicles arriving at the crossing, the number of lanes available at the intersection and whether or not there is a heavy left movement. When the need for mechanical signal control is established, a check is made at each intersection to determine from the traffic volume, prevailing movement, the number of available moving lanes, the influence of pedestrians and other factors governing traffic movement, the timing at which signals should be operated. These investigations have shown the use of short movements desirable. Cycles as low as 40 seconds are employed at many intersections.

Officer control at most isolated intersections can be an improvement over mechanical control if the officer appreciates the value of short movement and can give full time to his work. However, traffic officers must answer questions, assist pedestrians and enforce regulations, and these requirements, together with the common tendency to give long movement, to wait for wide-spaced vehicles approaching the intersection and the natural slow-down of activity as the officer becomes worn out by the monotony of the work, leave few officers efficient in traffic control.

Cleveland's Traffic Lights

At the present time Cleveland has installed 225 traffic lights, all suspended in the middle of the intersections. The great majority of these are at isolated corners in outlying sections and work independently. In numerous cases, where two intersections are not separated by more than 400 ft., two of these lights are tied together, working synchronously.

In addition to these intersections, we have three series or groups working on the progressive system. When running on the scheduled speed, automobiles arrive at each intersection after signals have been set to handle them without delay. Between the passing of these groups movements are given to cross traffic.

The first installation was that of East Cleveland, where, due to the extreme congestion on Euclid Avenue and the contemplated widening of the street, it became necessary to substitute some form of mechanical control for the manual control then in use. The first plan was to install a synchronous system. The length of the street proposed to be so controlled was approximately 2½ miles. It was proposed to install traffic signals at sixteen intersections in this distance.

Our experience with synchronous control up to this time had been very disastrous. The city of Cleveland had installed a series of synchronous lights in the congested district of Euclid Avenue, from East Eighteenth Street to the Public Square, which had the effect of slowing up car movement 20 per cent and increasing the average cost considerably, due to the increase in the demand which resulted from the simultaneous starting up of all cars in this area upon the appearance of the green light. In fact, this was so pronounced that an inspection of our recording power charts in the substations showed clearly the result on the power demand upon the appearance of each green light.

Progressive System Studied

With this effect in a distance of less than a mile, the Cleveland Railway readily perceived the difficulty that would ensue with a similar installation over a distance of 2½ miles, and as a progressive system had just been installed in the Loop District of Chicago, the company persuaded the officials of East Cleveland, Cleveland and Lakewood to accompany our officials on a trip to Chicago, where the system was minutely inspected. They learned that the system had been put into effect without any inconvenience and that, by its operation, traffic was moved through the Loop District more rapidly and more uniformly than previously. Street car movement in the area affected had been speeded up 20 to 25 per cent.

The officials of East Cleveland were profoundly impressed with this demonstration and voted to install a similar system on Euclid Avenue in spite of the considerable increase in cost over the original contemplated synchronous system. The Cleveland Railway, being equally interested in rapid car movement and decreased power costs, contributed largely to the work of installation, the city and the company working hand in hand to the end that the timing of the lights should correspond to our schedule speeds, which we then increased to 12 m.p.h. This street car speed permitted a speed of 24 m.p.h. or twice the street car speed for other vehicles. In other words, an automobile would run through two blocks while a street car moved through one.

The East Cleveland City Hall, being located approximately in the center of the system, provided the most logical location for the central control board. From this board, the lights at any intersection can be changed and the entire cycle which determines the speed throughout the area can be varied at will. The determining factor in the engineering calculations preliminary to this installation was the condition existing at Euclid and Superior Avenues, which is an oblique intersection, involving many left turns in two directions. To control this difficult intersection, six lights were installed.

**Abstract of a paper presented at the midwinter meeting of the New York Electric Railway Association, New York, N. Y., Jan. 31, 1928.*

Improvement With Lights

A check of this corner since installation shows definitely that many more machines pass with less congestion. Before the installation of the system, west-bound automobiles on Euclid Avenue were lined up for several blocks during many busy hours, whereas since the lights have been installed the line seldom extends beyond one block.

Profiting by the experience of East Cleveland, the city of Cleveland immediately started a study looking toward the conversion of the synchronous system installed on Carnegie Avenue to the progressive system. Carnegie Avenue is a boulevard, having no car tracks on it and is 3 miles in length. This change was made by an additional expenditure of about $7,500, to provide a master control, located at the center point on the system and control wires from it to each of the lights to coordinate their operation. The result of this change was to speed up the automobile traffic 30 per cent. Almost immediately thereafter the city changed the synchronous system on Euclid Avenue to the progressive system, thereby permitting us to speed up our schedules in this district by 20 per cent.

The city of East Cleveland, the city of Cleveland and the Cleveland Railway are convinced that traffic, controlled by automatic lights arranged in a progressive system, not only speeds up traffic, thereby relieving congestion, but so regulates headways as to render the advantage obtained applicable to other parts of the line not controlled by automatic lights. In addition to this uniform and smooth operating control, there is a marked reduction in accidents, due to the discouragement of speeding and the opportunity which is offered pedestrians to cross busy thoroughfares in safety. This is evidenced in the police records of East Cleveland, showing that there were 369 automobile accidents in this district in the year 1925 and only 155 in the year 1927, despite the usual increase in the number of automobiles upon the highway year by year.

Cities in general have merely scratched at the possibilities of automatic control of their traffic. There is an almost universal absence of engineering investigation preceding the installation. Most cities confronted with a serious congestion problem are deluded by the traffic light salesmen into the belief that their problem will be immediately solved by the installation of numerous lights. Such is far from the truth. Most light installations at the present time are a hindrance to the movement of traffic and tend to create congestion rather than relieve it.

Upon the purchase of a number of units by any city, there comes imme-

Digitized by Google

diately a flood of requests from councilmen or aldermen for the installation of lights at their pet corners and for the most part, lights are distributed with reference to the respective political influence of the various public representatives rather than by the traffic requirements of the community. Unnecessary installations, operated continuously, while the demand is seasonable or covers only a short period of the day, contribute to violations.

Traffic lights, as such, are not a panacea for our congestion problem. There are certain locations where probably no mechanically controlled light will operate better than the present manual control. Our experience in Cleveland, however, has demonstrated to our own satisfaction that the progressive system, installed throughout a considerable extent of the congested district, when scientifically installed, does relieve congestion.

Brakes as They Affect Schedule Speeds and Accidents*

By E. R. Fitch

District Engineer Westinghouse Traction Brake Company

ONLY by taking advantage of every possible improvement in detail brake performance can we hope to supply to our fullest ability the increasing demand for faster and safer transportation. All factors which affect the schedule speed and particularly the braking characteristics of the car or train, influence the capacity of the system to a marked degree. An analysis of recent improvements in traction brake equipment shows that the stopping time is reduced approximately a half second for every second clipped from the brake application time, the standing time is shortened by the quicker release and that the flexibility of control has not been sacrificed. The most important development in recent years in surface car braking is the variable load attachment, which has been in subway service for the last thirteen years. The weight of the original design prohibited its use on city surface cars.

The combined effect of these modifications is to increase the running speed from 14.1 m.p.h. to 15 m.p.h. or 6.4 per cent, of which the effect of the variable load alone is 0.8 m.p.h. or 5.6 per cent. This is based on average surface car conditions assuming 30,000 lb., four-motor cars with a load of approximately 16,000 lb. or 110 passengers, with 8.15 stops per mile.

Good surface car brakes induce confidence in the car operator in his ability to stop promptly which results in the car keeping abreast of the traffic stream in heavy congestion instead of continually dropping behind. From a review of these elements it will be seen that the earning capacity of the cars would be increased at least 3 per cent due to the brake improvements at an increase in car cost of only 1½ per cent.

There is no one factor more important in the claims department record of accidents than brake performance and brake integrity. The latter may be considered to include protection of the brake to function even if one or more devices are defective, protection against man failure, against door and step accident, wheel sliding on bad rail, depletion of reservoir pressure, brakes leaking off when changing ends, and preventing passenger panic if the operator becomes incapacitated by permitting egress from the car when it is automatically stopped. The air brake and safety car control equipment provides this insurance through the deadman emergency feature, which balances the doors, sands the rail, cuts off the power and produces the shortest possible stop.

The recent improvements previously described will shorten the stop of the cars, already compared on a schedule speed basis, about 14 ft. for the reduction in application time of one second and about 40 ft. under the load condition with the variable load attachment from an initial speed of 20 m.p.h.

In the face of an impending collision, therefore, the car with this improved brake would be completely stopped while the other would be running at a speed of 8 m.p.h., retaining 40 per cent of its initial speed. This is probably the most important consideration as regards brake performance and its relation to accident hazards.

The ultimate measure of brake performance is the stopping distance and for comparative conditions from an initial speed of 20 m.p.h. a reduction of one second in the application time indicated a corresponding reduction in the stop distance of 14 ft. or about 10 per cent; under the load condition the variable load brake shortened the stop 28 per cent.

The actual brake shoe force developed is influenced to a marked degree by the details of brake rigging design. New cars with well designed brake rigging are generally conceded to develop about 70 to 75 per cent of the nominal shoe force and the loss of 25 per cent is due to rigging friction, release springs, armature and wheel inertia. For some of the old cars this figure may be as low as 50 per cent. Other conditions being comparative this factor alone means that the stopping distance would be increased 33 per cent. Obviously this condition would prevent the development of the full capactiy of the cars.

**Abstract of a paper presented at the midwinter meeting of the New York Electric Railway Association, New York, N. Y., January 31, 1928.*

Central Accountants Announce Program

SECRETARY L. E. Earlywine has just announced the program for the 56th meeting of the Central Electric Railway Accountants' Association. The meetings will be held at the Gibson Hotel, Cincinnati, Ohio, on Feb. 17 and 18. They will be preceded by a meeting of the executive committee at 9:30 a.m. the first day.

Friday, Feb. 17, Beginning 9:45 a.m.

Address of Welcome, Benjamin Frankland, auditor Cincinnati Street Railway.

"Ticket Office Ticket Printer," by L. P. Stickel, Ohmer Fare Register Company.

"Changed Price Levels and Property Accounting," by H. G. Baldwin, American Appraisal Company.

Discussion of items published in the Agenda.

Informal dinner, 6:30 p.m.

Saturday, Feb. 18, Beginning 10 a.m.

"Interlining with Central Freight Association" Informal discussion led by C. E. Baker, auditor Lima Toledo Railroad.

General business.

Election of officers.

Brady Memorial Awards to be Presented

PRESENTATION of the three Anthony N. Brady Memorial medals, awarded by the American Museum of Safety for outstanding accident prevention and health promotion work among electric railway organizations for the year ended Dec. 31, 1926, will be made at ceremonies to be held at the Hotel Biltmore, New York, N. Y., on Feb. 17. Many persons prominent in the electric railway field will attend the meeting.

Lewis Gawtry, chairman of the museum's committee of award, will preside. The medals and certificate will be presented by Haley Fiske, president of the Metropolitan Life Insurance Company. Other speakers will be Arthur Williams, president of the American Museum of Safety; Col. A. B. Barber, Lucius S. Storrs and James H. McGraw, members of the committee of award.

The awards for 1926 are: Gold medal, Louisville Railway; silver medal, El Paso Electric Company; bronze medal, Tide Water Power Company; and certificate of honorable mention, Pittsburgh Railways.

Safety Congress Meeting in New York City

THE Seventeenth Annual International Safety Congress is to be held in New York City Oct. 1 to 5 inclusive. This decision was made recently by the Executive Committee of the National Safety Council. All of the old popular features will be retained and several innovations introduced.

Digitized by Google

Progress in Band Brake Design*

By A. D. McWhorter
General Superintendent Memphis Street Railway, Memphis, Tenn.

IN DEVELOPING the light-weight noiseless railway coach, one of the major problems was to develop a light-weight noiseless brake rigging. As a result, the band brake on street railway cars is today a reality. In general there are two types of band brakes, the external, or clasp type, and the internal expanding type. The internal expanding type, such as used on the Joliet car, utilizes metal brake blocks, while the external clasp type uses either brake lining or metal blocks.

There are probably less than a dozen street railway companies in the country using such brakes. According to available records, the first experimental equipments were designed by W. J. Smith, master mechanic Twin City Rapid Transit Company, Minneapolis, in the summer of 1920. The original experimental equipment was on double-truck cars, approximately 37 ft. long and weighing 28,000 lb. Satisfactory results have been reported and since that time the Twin City company has built for its own use and for other companies a total of 101 cars equipped with the Smith light-weight noiseless truck with band brakes.

Steel and Gray Iron Drums Used

Both steel and gray iron drums have been used, steel being the lighter, gray iron the quieter. Gray iron has been adopted as standard. Brake shoe backs are steel, lined with ¾-in. "Hyco" brake lining and soft gray iron lugs at the ends. The total cost per lining (8 linings per car) is $2.36. The average cost per thousand car-miles for brake linings is $1.06. Gray iron brake shoes at $40 per ton used on steel wheels in similar service cost $1.74 per thousand car-miles. In addition to the above saving in favor of brake bands, there is also a saving in labor in adjusting and renewing brake shoes, adjustment being necessary only after 2,000 miles service.

In the 33 months of operation, the total mileage was 511,500, an average of 93,000 miles for the wheels. To date only a few of the wheels have been removed. Officials of the company believe that the wheel mileage on this class of equipment will be increased from 40 to 50 per cent. The weight of the wheels when new was 297 lb. When removed from service, the weight was 139 lb. In other words, in 93,000 miles service, 108 lb. of weight was lost. Under similar conditions but with gray iron brake shoes used on the tread of the wheel, 60,000 to 65,000 wheel-miles would be considered a fair average. This comparison would indicate about 33 per cent increase in wheel-miles with band brakes. The above description of equipment applies to hollow street car axle trucks.

The Tennessee Electric Power Company, Chattanooga, placed in service about Nov. 1, 1926, ten cars built by the Twin City Company. Up to Jan. 1, 1928, these cars operated a total of 594,000 miles. They experimented with many kinds of linings and adopted the Gatke brake linings as standard. Adjustment is made on a 1,000-mile basis but experiments have proven that the adjustment period may be extended to 3,000 or 4,000 miles. The cost per thousand car-miles with ½ in. by 6 in. Gatke brake linings is $1.16. It is the opinion of the operating officials that the cars equipped with band brakes are much quieter than cars with brake beams, hangers, heads, shoes, etc. The estimated life of 26-in. wheels with band brakes is 100,000 to 125,000 miles.

The Springfield Street Railway, Springfield, Mass., has had a double truck car in service since May 13, 1927, which has operated approximately 8,000 miles. It has a seating capacity of 45 and weighs 25,300 lb. The brake equipment was assembled from Westinghouse Air Brake Company material, making whatever changes were necessary to accommodate standard equipment to the special requirements. The essential features are an application and release magnet, and an emergency magnet which in conjunction with a K-1 emergency valve gives all safety features on open circuit. Sanding is accomplished, except in emergency, by means of magnet valves.

Brake Shoes of Special Material

The brakes are inspected during the car inspections made every 1,000 miles. Adjustment is not always necessary on the 1,000-miles basis. The brake shoes are of special material, manufactured by the American Brake Block Company, and have proven very satisfactory. To date the brake shoes show no appreciable wear and officials have no figures as to cost per 1,000 car-miles. It is estimated that considerably longer wheel life will result from wheels which are not subject to gray iron shoe wear.

When this special material is employed the coefficient of friction is much more constant under varying speeds than with gray iron shoes on a steel wheel. The brakes give a very smooth stop without the sudden shock which is experienced with gray iron shoes just before the car comes to rest. This is true even with excessive rates of braking. In trials with various types of brake linings and various materials for brake drums, it has been found that certain combinations give more effective braking power and that squeaking noises can be eliminated. In Chattanooga the Gatke brakelining with Hunt Spiller gun iron drums have been found quiet and most satisfactory. In tests which have been made, the deceleration has run as high as 4.35 m.p.h. per second without discomfort. The ordinary braking rate on this car is around 2 m.p.h.

In Joliet, Ill., there is in operation an experimental car equipped with Westinghouse automotive type brake diaphragms, carried directly on the automotive type axle housings and connected through the brake mechanism to the internal expanding shoes at each wheel. The brake drums are 17¼ in. in diameter with 4-in. face. They are bolted to the inside of the wheels and have fins turned on their outside surface to improve heat radiation. There is 1/16 in. effective wearing metal to insure long life before renewal is necessary. Two brake blocks are used on each shoe having an area 4 in. by 5½ in. Almost four times the braking surface ordinarily provided on buses is thus obtained.

Abstract of a paper presented at the semi-annual meeting of the Electric Railway Association of Equipment Men. Southern Properties, held at New Orleans, La., Jan. 25-28, 1928.

American Association News

DETAILS of the work now in progress were discussed at a meeting of way and structures special committee No. 2 at association headquarters, New York City, on Jan. 18.

A drawing of the proposed 200-ft. lateral switch was submitted by Mr. Stiff, who was representing Mr. Entwisle. In the discussion which followed, Mr. Ryder suggested shortening the tongue and over-all length of the switch, which would make tongue and casting stiffer and lighter, and should reduce the cost of the switch. Mr. Alden objected on the grounds that it would increase the overhang on clearance curves about 1 in. or less and increase the angle on incidence ½ deg. It was decided that the 16-ft. 6-in. over-all length of switch be maintained, the point of the tongue to be 2 ft. 8 in. from the end of the casting, measured at a point 1 in. back from the tip of the tongue, and between these points to be exactly the same as the 100-ft. lateral switch.

The shape of the pocket for the 200-ft. lateral switch was discussed and changes were suggested by Mr. Stiff. Mr. Alden was requested to make a new drawing showing the approach radius on both sides as 5 in., and the pocket radius on both sides as 1½ in. Copies of the drawing are to be sent to all members of the committee for study, and the chairman will send out a letter ballot for approval.

The width of groove for both the 100-ft. lateral and 200-ft. lateral switches was discussed at length. It was decided that in all switches of 100 ft. and larger radii the groove be made 1 1/16 in.

On the way to lunch the committee looked over several special-work lay-

Digitized by Google

outs of the Third Avenue Railway to observe the effect of wheel wear on the tread of the running rail at the pocket and to determine if possible whether the shape of the pocket had any particular relation to the development of a cup on the tread of the rail at that location.

At the afternoon session drawing No. 114,152, 9-in. high standard switch, prepared by Mr. Entwisle was submitted and discussed. The design was approved by the committee, except that the diagonal braces should follow the revised design for 100 ft. lateral switch. It was also voted that plan No. 110,113 for the 200-ft. equilateral switch be approved and Mr. Alden was requested to prepare a finished drawing for submission at the next meeting. The plan proposed at the previous meeting "that the distance from the tangent point to the point of tongue, and length of tongue, and location of lug be determined for the 50-ft. lateral, 75-ft. lateral, 100-ft. equilateral and 350-ft. equilateral tongue switches" was tabled for the time being.

After discussion the committee decided that the manufacturer's name or brand be placed on the cast-iron cover, on the guard of the switch tongue, and also on the guard of the switch body just back of the tongue pin. Just beyond the manufacturer's name or brand on the guard shall be placed the letters A.E.R.E.A., followed by the figures indicating the radius, and letters indicating the hand. Mr. Payne asked for further instructions on the subject, and also presented plans for several different types now in use. After discussing the matter Mr. Payne was requested to prepare two designs, one for T rail in open track and one for girder rail in closed track.

The committee decided to change the title of subject D from "Maintenance Standard for Track Switch Tongues in Paved Streets," to "Rules for Maintenance of Tongue Switches." Mr. Bragg presented a report giving rules for the maintenance of hand-throw tongue switches, and also for electrically operated tongue switches. He was requested to make some changes suggested by members of the committee and report at the next meeting.

Mr. Peabody submitted a plan showing three layouts for No. 8 double spring frog marked A-B-C. Layout B was approved with some changes to be made. It was decided that to have a supported joint at the toe of the frog, and that the space at the toe be 19½ in. and the spaces at the heel be 18 in. making a suspended joint at the head. Over-all length of the frog is to remain 15 ft. Design 1521 of the Bethlehem Steel Company for double spring rail frog will be used for the design of the anti-creeper device, in place of the arrangement shown on layout B of Mr. Peabody's design.

Mr. Alden submitted two drawings for the proposed 16-ft. 6-in. long split switch, one for wheel flanges A, B, C and D only and one for wheel flanges A, B, C, D, and E and F. After considerable discussion it was decided by the committee that the spring should be 18 in. long. Other changes, of which Mr. Alden made note on his plans, were suggested by the committee and Mr. Alden was requested to submit at the next meeting of the committee a revised single plan covering the subject instead of two plans.

The next meeting is to be held at Association Headquarters on Friday, Feb. 24.

Those present were E. M. T. Ryder, chairman; E. P. Roundey, vice-chairman; H. F. Heyl, C. A. Alden, G. A. Peabody, D. R. Payne, J. U. Bragg and Mr. Stiff representing Mr. Entwistle.

Affiliated Association Committee Appointments

COMPLETE assignments of committees of the American Electric Railway Association and affiliated associations have now been made. The list of American committees was published in full on Jan. 28. The Engineering Association committees were published as they were appointed after the beginning of the association year. In the following list are the complete committee lists of the Accountants', Claims, and Transportation and Traffic Associations, together with certain Engineering Association committees which have not heretofore been made public.

Accountants' Association

Fare Collections

E. A. Tuson, general auditor Public Service Railway, Newark, N. J., chairman.
J. D. Evans, St. Louis, Mo.
A. G. Neal, Washington, D. C.
W. G. Nicholson, Omaha, Neb.

Freight Accounting

Walter Shroyer, treasurer for receiver Union Traction Company of Indiana, Anderson, Ind., chairman.
F. I. Fleming, Champaign, Ill.
F. A. Healy, Springfield, Ohio
L. T. Hixson, Indianapolis, Ind.
A. E. Wafer, Akron, Ohio

Review the Proceedings

J. E. Heberle, assistant to president Capital Traction Company, Washington, D. C., chairman.
F. E. Hageman, Milwaukee, Wis.

Standard Classification of Accounts

M. W. Glover, general auditor West Penn Railways, Pittsburgh, Pa., chairman.
Thomas Conway, Jr., Philadelphia, Pa.
J. H. Hanna, Washington, D. C.
I. A. May, New Haven, Conn.
C. S. Mitchell, Pittsburgh, Pa.
H. L. Wilson, Boston, Mass.
P. S. Young, Newark, N. J.

Stores Accounting

R. A. Weston, special accountant the Connecticut Company, New Haven, Conn., chairman.
W. S. Stackpole, Newark, N. J.
F. E. Wilkin, Youngstown, Ohio

Bus Accounting (Sub-Committee, Standard Classification of Account)

E. A. Tuson, general auditor Public Service Railway, Newark, N. J., chairman.
C. R. Mahan, Highwood, Ill.
J. F. Schmunk, Philadelphia, Pa.
C. W. Stocks, New York, N. Y.
N. E. Stubbs, Baltimore, Md.

Convention Program

E. H. Reed, auditor Brooklyn City Railroad, Brooklyn, N. Y., chairman.
L. T. Hixson, Indianapolis, Ind.
C. E. Yost, Wilmington, Del.

Editing

L. E. Lippitt, Thermo-ice Corporation, Auburn, N. Y., chairman.

Engineering Accounting

L. T. Hixson, auditor Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., chairman.
F. A. Healy, Springfield, Ohio
T. P. Kilfoyle, Cleveland, Ohio
C. R. Mahan, Highwood, Ill.
Walter Shroyer, Anderson, Ind.

Claims Association

Editing

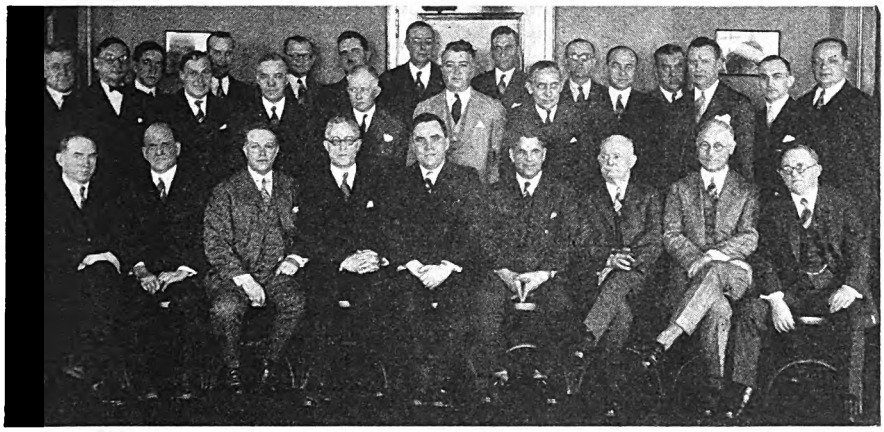
Exhibit

PREPARATIONS for the 47th convention of the American Electric Railway Association, to be held in Cleveland on Sept. 22-28, were carried forward at the meeting of the committee on exhibit held in the office of Col. Joseph H. Alexander, Cleveland, Ohio, on Feb. 8.

Those present included Chairman Alexander, L. W. Shugg, vice-chairman; C. S. MacCalla, chairman of the entertainment committee; J. C. McQuiston, vice-chairman of the entertainment committee; J. W. Welsh, general secretary; F. C. J. Dell, director of exhibits; L. D. Bale, J. R. Blackhall, O. A. Broten, F. B. Bullock, W. E. Cann representing C. C. Castle, C. H. Clark, H. F. Flowers, R. A. Hauer, C. S. Hawley, A. L. Kasemeier, H. J. Kenfield, E. J. Lang, H. E. Listman, S. P. McGough, A. M. Robinson, Ross Schram, S. P. Seward, L. F. Stoll,



Members of the exhibit committee at the recent Cleveland meeting

J. B. Tinnon, L. G. Dickey, manager of the Cleveland Auditorium, and J. W. Kellison, assistant to president Cleveland Railway.

Mr. Dell was appointed to act as secretary of the meeting. He read the report of the director of exhibits, outlining the preliminary work which had been done. A special committee on contract, with Frank R. Coates as chairman, has made the agreement with the Cleveland Convention committee, covering the housing and preparation of the exhibit. This agreement is drawn along similar lines to that of last year. Contracts have also been drawn with the sub-contractors for furniture, flowers, drayage, etc. The prices agreed to by all contractors are in line with those previously quoted. All contractors are acceptable to the Auditorium management and are acquainted with its personnel. The rules and regulations adopted are practically the same as those for last year, which were found very satisfactory.

Attention was called to the action of the executive committee of the association, which set a rate of 60 cents per square foot for inside space and $2 per lineal foot of track space. Mention was also made of the resolutions regarding outside exhibits, assignment of one day for inspection of exhibits and plans for inspection of local manufacturing plants. These were published in this paper for Feb. 4, page 223. It was also pointed out that on account of the early dates for holding the convention this year it is planned to send out space applications on April 16, with 30 days' allowance for filing them.

Minutes of the meeting of a sub-committee appointed for the purpose of laying out floor plans were also read. This sub-committee, of which L. W. Shugg was chairman, met on Feb. 7. It was decided to recommend that the registration facilities should be placed in the new main building on the Lakeside Avenue side. After considerable discussion it was proposed to locate the dance floor in approximately the same position as last year. The same scheme as last year's for space layouts for the esplanade, the track space and the west wing was recommended. It was decided to recommend that the Engineers' meeting room be located in the lower exhibition hall, and that location of all the other meeting rooms be left to a special sub-committee. The report was approved by the main committee.

Chairman Alexander brought up the question of exhibit day, and Mr. Welsh explained the reasons for selecting Tuesday, Sept. 25, instead of Wednesday, the usual day. After hearing the report it was voted to set aside Tuesday as exhibit day. The space layout for the arena floor, with the ball room as recommended by the sub-committee, was approved.

Mr. Robinson spoke of the desirability of having the exhibits open at 9 a.m. on Saturday, Sept. 22, instead of at noon as was done last year. After a general discussion this opening time was approved. It was also decided to have a formal opening ceremony and some form of entertainment for Saturday evening. Mr. Welsh was instructed to inform the transportation committee to arrange so that the special trains will arrive in Cleveland in time for the opening.

It was decided to hold the next meeting of the exhibit committee, for the purpose of assigning space, at the office of the chairman, in Cleveland, at 10 a.m. on May 16.

Street Traffic Economics

ORGANIZATION of the committee on street traffic economics was effected at a meeting held at association headquarters in New York City on Feb. 9. Those present included the following: G. A. Richardson, chairman; John A. Beeler, E. P. Goodrich, J. H. M. Andrews, J. R. Bibbins, S. E. Emmons, R. F. Kelker, Jr., E. J. McIlraith, L. H. Palmer, G. C. Hecker and Charles Gordon. After preliminary discussion of the scope of the committee's work it was voted to change the name of the committee to that given above instead of "street traffic and mass transportation," which was the name originally selected.

Most of the time of this first meeting was devoted to a discussion of the various phases of the street traffic problem with a view to determining the scope of the work to be undertaken this year and developing a plan of procedure. At the suggestion of Chairman Richardson, Mr. McIlraith read a rough outline of suggested topics for consideration.

It was the consensus of opinion that the committee should confine itself this year to a consideration of only such phases of the traffic matter as could be handled in the limited time available, with the understanding that the committee's activities will probably extend over a period of several years, and that this year's studies will form the groundwork for the extension of its work.

It was likewise agreed that the committee should confine itself to the development and presentation of principles and basic facts that affect the proper solution of the traffic problem. It is not anticipated that the committee will be able to agree entirely on some of the fundamental principles involved, but in that event it will endeavor to present diverging views on the subject so as to provide the public and the industry with an adequate and authoritative outline of current thought on traffic matters.

At the suggestion of the committee, Mr. McIlraith prepared a rough outline of his suggestions regarding the scope of this year's work. The topics suggested were as follows:

"Reasons why people concentrate in cities and in central areas."

"Interpretation of purpose of streets as public thoroughfares."

"Legal history of rights to use of streets."

"Present use of city streets in various types of cities (a) service in maximum hour showing number and type of existing traffic units, including pedestrians; (b) measure of relative use during various hours of the 24; (c) compilation of wastage of street space; (d) principles of betterment of use of streets; (e) betterment measures now in actual practice."

Mr. McIlraith was delegated to compile a more comprehensive outline of the available data and opinions on these respective topics.

News of the Industry

Injunction Against New York Fare Increase Denied

Supreme Court Justice Ernest E. L. Hammer on Feb. 4 denied the application of the Bronx Chamber of Commerce to restrain the Interborough Rapid Transit Company from increasing the fare on its subway and elevated lines from 5 to 7 cents because the city was not a party to the action. The denial was without prejudice to a renewal on proper papers. It followed the assertion by Samuel Untermyer, special counsel of the Transit Commission, that such litigation at this time would serve only to "muddy the waters" and complicate matters. Mr. Untermyer asked for the postponement of any move for an injunction until the Transit Commission had acted on the Interborough's application to put the 7-cent fare into effect within five days.

Conferences among city and state officials on Feb. 9 resulted in an apparent agreement to oppose the application in three separate suits, one to be brought by the city, one by the Transit Commission and a third suit to be brought jointly by the city and the commission.

City Appeals Denver Case

The city of Denver has filed a petition with the United States Court of Appeals at St. Louis for a rehearing of the case in which that body declared in substance that the Denver Tramway franchise was perpetual. Talk has recently been revived of a plan to carry the case to the United States Supreme Court if the present plea for a rehearing is rejected. This is so even in the face of the fact that it was stated at the time the decision was rendered such a course was unlikely on the part of the city since the United States Supreme Court had refused in January, 1927, to take jurisdiction. The issues involved in this case were reviewed in the ELECTRIC RAILWAY JOURNAL for Dec. 24, 1927.

Commission Sought as Arbitrators in Fort Wayne

Formal request for the Indiana Public Service Commission to act as a board of arbitration in a wage dispute between the Indiana Service Corporation and its railway employees at Fort Wayne, Ind., was made in a petition filed by representatives of a committee said to represent a majority of the trainmen.

Wage increases sought as indicated in the petition follow: For the first three months from 41 cents to 65 cents an hour; after the first three months from 41 and 43 cents an hour to 67½ cents, and for the succeeding nine months and more than a year 70 cents an hour. The present wages, the petition asserted, are "wholly inadequate to maintain a family and meet the living conditions in Fort Wayne."

The petition was filed under the terms of a clause in the working agreement authorizing employees to refer disputes to the commission for arbitration when relief is denied by the company.

New Fares in Port Arthur

A new schedule of fares went into effect on Jan. 21 in Port Arthur, Tex. It provides for the same 10-cent straight fare, three tickets for 25 cents and a weekly card for 40 cents, which calls for a nickel fare as many times as used each week, similar to the fare rates in Houston. The Port Arthur Traction Company was sold recently to the Eastern Texas Electric Company. Confirmation of the scale was made on Jan. 10 in federal court at Beaumont.

Ten Cents in Madison—Valuation Under City Figure

An increase in cash and ticket fares was granted the Madison Railways, Madison, Wis., by the Wisconsin Railroad Commission to take effect on Tuesday, Feb. 7.

Cash fares are increased from 8 cents to 10 cents; sixteen instead of seventeen tickets will be sold for $1 and three tickets for 25 cents. School childrens' tickets will be sold at ten for 50 cents; two children under twelve will be allowed to ride for one adult ticket; heretofore such children were allowed to ride for 4 cents. These rates will also be applied to buses, but no free transfers will be allowed between trolleys and buses.

The order of the commission places the valuation of the property at $1,203,000, whereas the company claimed a valuation of $2,188,501.

The commission turned down the weekly pass privilege, which had been asked by the city. As to the contention of the city that lower fares would help the company more than higher fares the commission said:

> As the lower fares have been in effect heretofore and did not produce the required return, we are satisfied and find that lower rates will not produce the desired result.

The commission has questioned an item of debt of $73,951 against the company said to have once been cancelled but later restored as an obligation of the railway but apparently and inadvertently not entered on the books of account as an obligation.

Governor and Mayor Agree on Chicago Program

Governor Len Small and Mayor William Hale Thompson of Chicago have agreed on a program which may speed settlement of the Chicago transportation problem. Following a conference with the Mayor, Governor Small issued the following statement:

> Our minds have met on the desirability of giving Chicago home rule in the management and control of its traction and transportation problems, and in giving that city full power to negotiate franchises to become a law when approved by a majority vote of the people.

This does not necessarily mean the calling of a special session of the General Assembly to enact railway legislation, as the Governor has stated emphatically that he will not call a session for this purpose until the companies and the City Council are in complete accord on the bills to be enacted.

The Chicago City Council is showing a renewed interest in the transportation question and at the meeting on Feb. 10 was expected to consider the draft of bills proposed by the committee on local transportation. At that time it was also expected the transportation committee's subcommittee would present the draft of a bill providing for the consolidation of the surface and elevated lines. This committee was appointed to analyze the difference between the companies' and the local transportation committees' point of view.

Abandonment of Chestnut Street Tubes in Philadelphia

The city-Philadelphia Rapid Transit agreement for financing and construction of the $20,000,000 Chestnut Street surface-car subway was set aside recently by unanimous decision of the Superior Court of Pennsylvania. In reversing the ruling of the Public Service Commission, which had approved the pact, the Appellate Court held that the title of the ordinance of City Council which embodied the contract was "defective in law." Judge William B. Linn, who wrote the opinion of the Superior Court, said the title failed clearly and sufficiently to express its purpose to grant a perpetual franchise to the Philadelphia Rapid Transit Company to use the subway after expiration of a 50-year lease, or of a sale or gift of the tube to the company upon expiration of the lease.

Civic bodies opposed the city-company agreement on the ground that the transit company, after meeting the carrying charges of the funds borrowed by the city for the construction, was not entitled to take permanent

Digitized by Google

possession of the line. Counsel for those organizations also contended the contract was tantamount to the city lending its credit to a private corporation, in breach of the law.

Mayor Mackey said the ruling of the Superior Court would allow for procedure with the construction of a surface-car subway in Locust Street instead, with provision for a hook-up with Camden by means of the Delaware River Bridge.

Consultant on Electric Railway Safety Proposed

The executive committee of the electric railway section of the National Safety Council is considering the employment of a full-time consultant to serve on the Council's staff and help all of the members of the section to prevent accidents on their properties. A committee has been appointed on the subject; consisting of H. K. Bennett, Providence, chairman; E. K. Eastham, St. Louis, Mo., and Melville W. Bridges, Chicago.

The committee has found that it will cost approximately $10,000 a year to finance such a consultant and is asking the various electric railway members of the Council what they think of the plan and how they believe the amount could best be raised.

Public Hearing on Louisville Ordinance

Before action is taken on the bus franchise ordinance Mayor Harrison of Louisville, Ky., will ask the General Council to conduct a public hearing on the measure. The ordinance was released by Mayor Harrison on Feb. 4 and was scheduled for introduction in the lower board at the regular meeting of the General Council on Feb. 7.

The new draft of the ordinance is said to have the approval of the Louisville Railway officials, and unless there is serious objections from the public the measure is expected to pass the Council in its present form.

The ordinance insures a straight seven-cent fare for bus and street cars with interchangeable transfers from rail to motor and half fare for children during the remainder of 1928. It gives the Board of Works power to require the purchaser of the franchise to give bus service where a survey to be made shows such service is needed. The company's suggested ordinance was digested previously in these columns.

Zones Fares Up Five Cents on Tarrytown Line

Local fares for transportation of passengers on the White Plains-Tarrytown Line of the Westchester Street Transportation Company, Inc., are as follows:

Ten cents between the New York Central railroad station in the city of White Plains and the westerly boundary line of the village of Elmsford, and 10 cents between the easterly boundary line of the village of Elmsford and the end of the line in the village of Tarrytown, N. Y. The increase in each zone is 5 cents. The new rates became effective on Jan. 30, 1928.

Results with Five-Cent Loop Operation in Seattle

Since the first of the year patronage on the 5-cent city loop lines of the Seattle Municipal Railway, Seattle, Wash., indicates that a worth-while service is being rendered. As the cost of service is very small if one figures that the platform cost is paid as a guarantee anyway, the experiment will be continued as long as it is warranted.

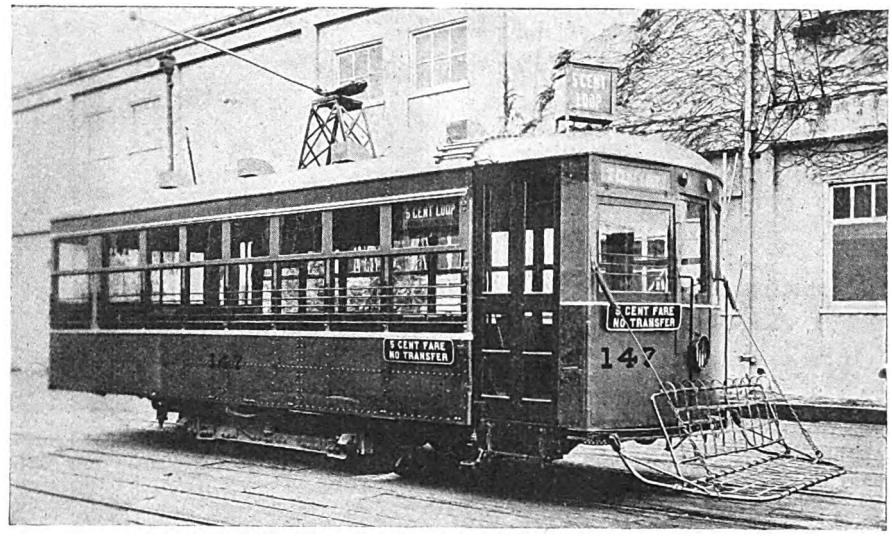
The installation of a service of this kind was debated for a long time. Finally on Nov. 7, 1927, the Municipal Railway began operating ten cars; three on First Avenue, four on Second Avenue and three on Third Avenue over a limited route. These were light-weight Birney one-man cars, and operated from Jackson Street as the south terminus, north on First Avenue, to Virginia Street, north on Second Avenue to Pine Street and east to Seventh Avenue, and north on Third Avenue to Stewart Street.

The fare was 5 cents without transfer privileges, or the regular 8⅓-cent token or 10-cent cash fare, if a transfer was desired. Transfers were accepted from other intersecting lines in the usual way.

Due to extreme peak service required in Seattle, several extra men are employed to operate tripper service who do not get a full day's work. These men are guaranteed $100 to $135 a month, and on this basis it was figured that the platform time on the 5-cent loop cars would cost little or nothing, since they did not go into service until after 9 a.m., and were out of service before 4 p.m., therefore an extra man could work a tripper and a loop car run, making an eight-hour day.

As shown by the accompanying statement, the patronage increased steadily through the Christmas shopping period, but declined during the week following Christmas. This of course was anticipated, but as stated before patronage has picked up since the first of the year.

During the first few weeks of operation, checks indicated that there was not enough patronage on First Avenue to warrant continued service on that street, so the First Avenue line with its three cars was discontinued on Jan. 2, 1928.



A Loop Line car painted in dark red with silver and orange trimmings

RESULTS OF FIVE-CENT CITY LOOP OPERATION BY THE SEATTLE MUNICIPAL RAILWAY

Briefs Filed on Discontinuance of Freight Service in Providence

A brief supporting its petition for permission to discontinue its trolley freight service, which, the company claims, has been operated at a loss, was filed on Jan. 31 by the United Electric Railways, Providence, R. I., with the Rhode Island Public Utilities Commission.

Replying to the contention of opponents to the petition that the appeal should have been made to the Interstate Commerce Commission, the brief sets forth that the federal commission has no jurisdiction over electric railways. The transportation act of 1920, the brief states, specifically excludes street, suburban and interurban electric railways from the jurisdiction of the national body in matters of construction and abandonment. Numerous court decisions, including one by Justice Holmes of the United States Supreme Court are cited to prove that a carrier has a right to discontinue any branch of the service after it finds that the branch is being operated at a loss.

Counsel for opponents of the plan filed a brief charging that the company, at a series of public hearings, failed to show that the business was operated at a loss and failed to show there was no public necessity for the service. The opponents say the freight service is necessary to their business.

Numerous Bouquets for Los Angeles Trainmen

If the Los Angeles Railway, Los Angeles, Cal., received any brickbats in 1927 they have been carefully buried, but the bouquets received live in the pictures of the 400 commended trainmen which cover four pages in the Jan. 30 issue of *Two Bells*, the official paper of the railway. Although the figures show that only 402 men were commended through patrons who made it a point to write to the company, the management distributed 4,275 credits for courtesy. Not all these men had a chance to show their faces in the Bouquet Columns of *Two Bells* during the past year.

By-Laws Printed for Supervisors' Association in Boston

Officers of the recently formed Supervisors' Association of the Boston Elevated Railway, Boston, Mass., include J. M. Patten, rolling-stock and shops, president; J. P. Banks, transportation, vice-president; E. L. Doyle, power, vice-president; Thomas Kivell, maintenance, vice-president, and J. L. Troy, transportation, secretary-treasurer. Article I, section 2, in the by-laws states that the object of the association is to promote acquaintance among the men who comprise the supervisory force of the Boston Elevated Railway. The programs of the meetings are partly informational and partly entertainment. Up to date the association has held three meetings and has now a membership of about 300. The leaflet giving the list of officers and by-laws has recently come off the press.

Montgomery Street Minus Toonerville and Track

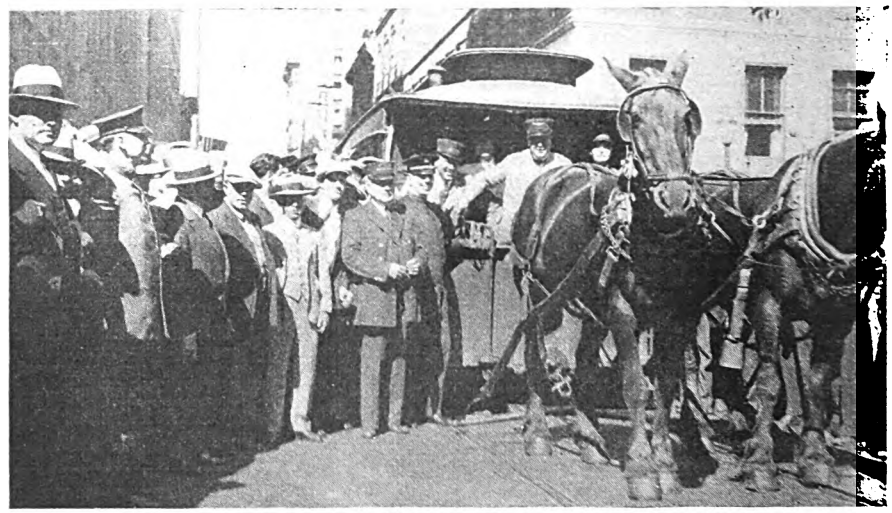
Finis was written to the story of the Montgomery Street line of the Market Street Railway, San Francisco, Cal., on Jan. 20 when pretty Miss Clarice Champion wielded the last pick stroke. It was a significant movement for it meant the scrap heap for the Toonerville Trolley, which rattled down that thoroughfare until last October when the line died. On the day of the last run many mourners gathered and blocked traffic, causing a bigger jam than the hushed dinkies which were accused of choking this "Wall Street of the West."

There were bands and speeches and flags and decorations, and serpentine and ticker tape and snowstorms of paper fluttering down the canyon that is Montgomery Street. And through it wound a strange procession of transportation, with the last of the Montgomery Street "Toonervilles" piloted by none other than Mayor Rolph.

The parade of street cars from the old horse-drawn car to the most modern car built by the Market Street Railway started at Leavenworth and Posts and followed the route of the Toonerville trolley as far as the Russ Building on Montgomery and California Streets.

There was an old stage coach in the lead—right behind the band wagon, that is whence the Municipal band furiously tooted "The Stars and Stripes Forever." Then came the last of the "dinkies," with Mayor Rolph in a Palm Beach suit and a trick motorman's cap at the controller. Behind it came an old-fashioned horse car. There was also an old cable car that hadn't been out on the street since before the fire. And there were two of the ultra-modern street cars that run on Market Street and thereabouts, but that have never dared the trick tracks of Montgomery Street before.

And now three months later the track is yanked up and Montgomery Street is bare of a railway. Miss Champion did a big job!



Mayor Rolph of San Francisco piloting last car over trick tracks on Montgomery Street

Commission Opponents Seek Office in Indiana

Already two well-known politicians, both opposed to present utility laws, are in the field for the nomination for Governor of Indiana, on their respective tickets, Frank Baker, an Indianapolis attorney, is a candidate on the Democratic ticket. He favors the abolition of the Public Service Commission. One of his latest activities in public utility matters was as a representative of the union in its contest with the Indianapolis Street Railway a year ago, for more wages. During the struggle cars were dynamited.

Alvah J. Rucker, another Indianapolis attorney, is a candidate on the Republican ticket. He recently was corporation counsel for Indianapolis. While he hedges on an out-and-out stand for the abolition of the Public Service Commission, he states that he believes the utility regulation laws should be changed so that the municipalities have more to say.

To Guide You on Your Way in Baltimore

The United Railways & Electric Company, Baltimore, is distributing 500,000 copies of a new street car directory. A map showing all street car and bus routes in the city is on one side. This also shows the points of interest in Baltimore. A complete list of all the changes that have been made in routes is given and a complete schedule of the various lines.

Paving Discussed at Conference

The question of relieving electric railways in cities of the necessity of paving between their tracks and two feet outside was a leading topic at the mid-winter meeting of the New York State Secretaries of Chambers of Commerce Conference held in Rochester, N. Y. The matter was brought before the conference by William J. Russell, secretary of the Queens Borough Chamber of Commerce, who urged that the railways be relieved of this cost by legislative action. The present law, he said, placed "an unjust burden both on street car riders and companies."

Mr. Russell urged adoption by the State Legislature of a bill that would relieve the companies of such paving cost except for 8 or 9 inches on the sides of the rail. Similar bills had been killed in previous sessions, he declared, because of opposition in the State Mayors' Conference. He suggested that if the smaller cities objected to the measure, it be made to apply to cities of the first class only.

The conference took no action on the proposal although it was the subject of lengthy discussion. G. C. Lehmann, secretary of the Buffalo Business Federation, suggested equitable fares as the solution of the paving problem. The people of his city, he said, did not object greatly to a 10-cent fare because the International Railway had, at the time the fare was boosted, started an extensive paving program in collaboration with the city and the public felt the street improvements offset the higher fare.

Suggestions and Complaints to Go Before Bureau

A special bureau for the receipt of complaints about service and suggestions for improvements or changes was recently established in Omaha, Neb., by J. N. Shannahan, president of the Omaha & Council Bluffs Street Railway.

Recommendation on Phoenix Rehabilitation

A report on bids submitted on Jan. 18 for rehabilitation of the municipally-owned railway system at Phoenix, Ariz., and a recommendation by City Manager Henry Rieger that the bid of the Claude Fisher Company, Los Angeles, be accepted and the contract awarded to it, have been submitted to the City Commission.

Mr. Rieger's recommendation was based on the fact that the Claude Fisher bid is considerably lower than the next best bid, there being a difference of more than $92,000 between that bid and the one submitted by Schmidt & Hitchcock, the next low bidder.

The tabulated report on bids, prepared by City Engineer W. J. Jamieson and his staff, shows that only two bids of the 28 submitted were based on rehabilitation of the entire system. These were received from Schmidt & Hitchcock, Phoenix contractors, whose total aggregate bid was $706,381, and from the Claude Fisher Company, whose total bid was $614,113.

Higher Fares Sought in Springfield

The Illinois Power Company, Springfield, Ill., has petitioned the Illinois Commerce Commission for an increase in railway and bus fares. It feels this is the only solution of the problem following the refusal of the city to relieve the company of paying a 4 per cent franchise tax.

A Pass for an "Ad" in Pittsburgh

Sell what you have to sell! Buy what you have to buy! Here's a weekly bargain pass thrown in for good measure! Virtually that is what Pittsburghers were told recently when they visited the new *Sun-Telegraph* want-ad corner at Fifth and Market Streets. A little prepaid want-ad for three consecutive insertions meant the acquisition of a weekly pass worth $1.50, good on the lines of the Pittsburgh Railways.

With the advent of the new year the Pittsburgh *Sun-Telegraph* opened a new want-ad headquarters and as a publicity stunt arranged to give the weekly pass to each person who placed a three-time want-ad with the paper. The railway agreed to allow the paper 10 cents rebate on each pass in return for the publicity which it would receive on the weekly pass sales.

Information is wanting on the buyer of that mole coat to fit a perfect "36" and of the touring car with four new tires and two spares; which bride, or was it a newly-wed couple, that rented the four rooms and kitchenette and what white girl answered the call of the bewildered mother who had two children on her hands and unable to do anything with them? All these the nuclei for absorbing short stories from real life!

Whether there was material aplenty for the imaginative mind at least there were customers enough to engage the services of the want-ad specialists who were in readiness to interview prospective advertisers who visited the *Sun-Telegraph* want-ad corner during the day, after the movies and between shopping tours. The first week 846 passes were distributed and the second week 1,100. Mr. Foster, the want-ad man, commented very favorably on the stunt. While the total sales of weekly passes did not show any noticeable increase valuable advertising was gained for the railway property.

Punishment for Portland Car Bandits

Three street car bandits who held up and robbed several conductors of the Portland Electric Power Company, Portland, Ore., last November, have been sentenced to ten years in prison.

Seattle Appeals to Mr. Von Herberg

Declaring litigation against the city of Seattle, Wash., and the Puget Sound Power & Light Company, instituted and maintained by J. G. Von Herberg had adversely affected the marketability of railway bonds and delayed improvements in the railway system, the City Council has asked Mr. Von Herberg to withdraw his suit.

In reply Mr. Von Herberg said:

> Let Mr. Leonard state definitely the conditions upon which he will agree to extend the payment period on the street railway purchase bonds.

A. W. Leonard, president of the Puget Sound Power & Light Company, has repeatedly declared that the only basis upon which his company would consider any extension of the time for paying off the purchase bonds would be contingent upon agreement by the city to reduce from 1 cent a kilowatt-hour to ½ cent, the price paid the city light department for current used by the municipal railway. City officials have been hopeful that Stone & Webster would consent to an arrangement whereby the remaining $10,000,000 in purchase bonds can be paid off in $500,000 annual installments instead of $833,000, the amount now paid annually.

New Group Insurance in Atlanta

Accident and heath insurance is being offered all employees of the Georgia Power Company, Atlanta, Ga., who work on an hourly basis. Through an arrangement with the Metropolitan Life Insurance Company the Georgia Power Company will pay part of the premiums on all insurance, provided 75 per cent of the total number of employees eligible avail themselves of the opportunity. The insurance provides payment for sickness or accident regardless of whether or not the sickness or accident is incurred while on duty. It is offered without medical examination regardless of age, sex, or physical condition. As soon as the insurance becomes effective the employees relief association will be disbanded.

Preliminary Report on New York's Suburban Transit Plan

Anticipating the completion of a comprehensive plan on suburban transit for the metropolitan district of New York, the Suburban Transit Engineering Board has submitted its preliminary report as of Jan. 11, 1928. In 36 pages the report covers the subject of the problem, localizing it in New Jersey, Westchester and Long Island and then going on to the tentative results following the formation of the Suburban Transit Engineering Board. Tentative results deal principally with peak hour travel for passengers delivered inbound by the railroads from Westchester and

Digitized by Google

Long Island to Manhattan. This analysis shows that during the most congested hour of the day by far most riders are destined for the terminals located in Manhattan and use additional subway service or elevated facilities to complete their journey.

Preliminary reports are included of the New Jersey sub-committee, Westchester sub-committee and Long Island sub-committee. It is the hope of the board that after careful consideration and exhaustive analyses of data submitted a comprehensive plan will be submitted at the earliest possible date.

Insurance Policies as Gifts Distributed in Gary

Christmas gifts in the form of life and total disability insurance policies totaling $66,600 in principal amount were distributed in December, 1927, to employees of the Gary Railways, Gary, Ind. Twenty-three employees who have been in the company's service for more than six years received paid-up policies of $1,500, and ten others in the service more than four years received paid-up policies of $1,000.

All other employees who had been with the railway for periods from six months to four years received policies of from $500 to $900 each. This is a Christmas bonus plan followed by the company for several years. Under it employees can take out additional insurance at low group rates.

J. M. Yount of Market Street Railway Wins $100

The first prize of $100 for the best articles on advancement in efficiency, accuracy and economy in operation at the Byllesby properties has been awarded to J. M. Yount, vice-president in charge of maintenance and equipment of the Market Street Railway, San Francisco, Cal. Last May it was announced in *Byllesby Management* that three cash prizes would be available to the authors of original articles appearing in the magazine during 1927 which best tended to show these points. Mr. Yount's discussion on street car maintenance and construction appeared serially in *Byllesby Management* during January, February, March and April.

Sixty New Members in Portland's Twenty Year Club

J. G. Mann, superintendent of the Piedmont carhouse of the Portland Electric Power Company, Portland, Ore., was made honorary president of the Twenty Year Club at the annual banquet and party held by the members at the Elks' Club on Jan. 18. He succeeds the late Frederick V. Holman. Sixty new members were voted into the club, the membership of the club now totals 374, all of whom have been with the Portland Electric Company twenty years or more.

Recent Bus Developments

Another Substitution by Morris County Line Approved

Substitution of buses for trolley cars by the Morris County Traction Company between Maplewood and Newark, N. J., was sanctioned on Feb. 1 by the Public Utilities Commission. The approval is subject to condition designed primarily to preserve the line as an express service from Newark to Maplewood and Springfield.

Only a limited number of stops will be permitted in Newark for the purpose of taking on passengers. The fare will be 20 cents, which, the commission points out, will eliminate use of the buses as a local service in Newark. The application was made by Joseph K. Choate and Joseph L. Tumulty, as receivers for the railway, for approval of municipal consents to operate buses through Maplewood, Springfield, Irvington and Newark.

By a decision last August, the board approved the substitution of buses for cars over the portion of the route from Newark to Lake Hopatcong, including intermediate municipalities. Municipal consents were obtained for the operation of twelve buses in Newark and for the operation of buses in Springfield and Maplewood. The rate of fare proposed and sanctioned is 20 cents from Newark to any point as far as the Passaic River Bridge, the boundary between Summit and Chatham.

Objections were interposed to approving the municipal consents by the Somerset Bus Company, the B. & N. Transportation Company and the DeCamp Bus Lines, Inc., together with other independent operators. Inasmuch as the operation of buses is only a substituted service, the board deemed it unnecessary to impose numerous restrictions asked for by objectors whose lines had been established only within recent years.

Bus Matter in Knoxville Goes Over to April

There will be no action until the meeting of the Council in April on the proposal of the Knoxville Rapid Transit Company, Knoxville, Tenn., to establish bus service there in competition with the railway lines of the Knoxville Power & Light Company. This postponement of consideration of the matter is the result of action by the service and the law committees of the Council. By that time it is expected the survey being made by associates of Harland Bartholomew, engineer for the planning commission, will be ready. Councilman Wright said:

We will all admit that Knoxville needs more transportation routes and facilities, but we all know equally well that the question of bus transportation is new to us. I believe we could all learn a great deal by awaiting the Bartholomew transit report. We shall all then know better how to decide this question.

Jitney Buses Compete with Oklahoma Railway

Jitney buses have started on one route in Oklahoma City, Okla., in competition with the Oklahoma Railway. The company will test the right of its competitor to operate, claiming that the federal injunction secured two years ago against rival bus lines is still operative. City authorities state the City Council has not approved operation of the rival line.

Terminal Planned for Philadelphia

The Philadelphia Rapid Transit Company announces that it intends to use the old public school building site at Fifteenth and Locust Streets for a terminal for its own buses with facilities for the parking of private automobiles. It also has plans for a garage and bus terminal near the northern end of the Broad Street subway. This project is to serve the same purposes which are performed in part by the parking areas in West Philadelphia and in Frankford. The terminal will cost $2,000,000. It will be equipped to take care of buses, taxicabs and automobiles. Surface cars and motor bus feeders will loop the proposed terminal at the northern end of Broad Street.

Perfect Safety Scores in Youngstown

Thirty-three drivers of the Pennsylvania-Ohio Coach Lines, a subsidiary of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, had perfect safety records in the second half of 1927. Not one had a chargeable accident. Twenty-two of these men had perfect scores for the entire year. Eight others, some of them in the service less than six months, went throughout the last three months of 1927 without a chargeable accident. Gold buttons will be presented to the men who had no accidents during the year and certificates to those who had no accidents in the six-month period.

Stage Service for Orange Show in San Bernardino

The Pacific Electric Railway has applied to the California Railroad Commission for authority to operate auto stage service from the Pacific Electric station at San Bernardino to the National Orange Show Building in that city during the period of the show each year.

Financial and Corporate

Deal for Indianapolis-Cincinnati Road Reported

William L. Taylor, attorney for the Central Union Trust Company, New York, trustee of the bonds of the Indianapolis & Cincinnati Traction Company, Rushville, Ind., has confirmed the report that a deal for the property is under consideration. According to Mr. Taylor, C. T. DeHore and associates, Toledo, are seeking to purchase all outstanding bonds of the company and its subsidiaries, following which they would bid the property in at foreclosure as bondholders. The property has been in receivership for three years.

The company owns and operates 104 miles of main electric interurban track between Indianapolis and Connersville and Indianapolis and Greensburg, Ind. It owns its own power plant and its own right-of-way between these cities. It is understood that Mr. DeHore and his associates plan to extend the line to Cincinnati. The road was built by the late Charles L. Henry.

Kentucky Railway Included in Deal

Sale of the controlling interest of the Kentucky Power Company and the Maysville Public Service Corporation and their subsidiaries to the United Public Service Company, Chicago, has been confirmed by Barrett Waters, president of the Kentucky Utility Companies. The properties, which supply power to the greater part of Northern Kentucky and include the Maysville Street Railroad & Transfer Company, Maysville, Ky., and the Kentucky Engineering Company, the latter at Augusta, are valued in excess of $4,000,000, according to Mr. Waters.

Hearing on Kansas City Bonds Concluded

Arguments on the appeals filed by second mortgage bondholders of the old Kansas City Railways, Kansas City, Mo., which was purchased by the Kansas City Public Service Company from the order lifting the receivership in June, 1926, were recently concluded in St. Louis before the United States Circuit Court of Appeals.

The appeals were based on the objections of the second mortgage bondholders and the preferred stockholders. They contended that the federal court order turning over the property to private ownership failed to give them a fair representation in the new company on the basis of their securities in the old one.

Blatchford Downing declared no provision was made in the reorganization plans for either the holders of $5,000,000 of second mortgage bonds of the old company or for the stockholders. He declared that the provisions made by the reorganization plan for first mortgage stockholders and unsecured creditors holding damage claims amounting to more than $2,500,000 who were practically paid in full, was in effect a diversion of the funds due the holders of second mortgage bonds and the stockholders.

Increase in Preferred Stock of Philadelphia Rapid Transit

The Philadelphia Rapid Transit Company will shortly apply to the City Council for the right to issue $5,000,000 of 7 per cent preferred stock. $1,500,000 of this money will be used to put the Market Street subway tracks straight through under City Hall. About $2,000,000 will be used for a bus, taxicab and automobile-garaging terminal at Fifteenth and Locust Streets. About $1,500,000 will be used for a garaging terminal at the Olney Avenue end of the Broad Street subway, where provision will be made for street cars, buses, taxicabs and automobiles.

Gross Revenue of Chicago Surface Lines Higher in December

In spite of a decrease in total passengers carried, gross revenue of the Chicago Surface Lines was higher in December, 1927, than for any other month last year. The gross earnings of the system last December were $5,365,172 compared with $5,133,348 in November and $5,417,666 in December, 1926. Due to a reduction in operating expense the divisible receipts in December exceeded both those of November and December 1926.

Revenue passengers handled in December, 1927, totaled 137,135,000, a decrease of 390,088 compared with rides reported for December, 1926. During the week before Christmas, 1927, there was a gain of 2,500,000 passengers over the number carried in the similar week of 1926.

Another Loan Bill Appears in Seattle

A temporary loan of $550,000 to the City Railway fund from the Municipal Light Extension bonds 1926 construction fund is provided in a bill introduced at an adjourned meeting of the City Council of Seattle, Wash. A bill providing for a temporary loan of $400,000 from the light fund to the City Railway fund was introduced at an earlier meeting of the Council. Both bills are now in the hands of the finance and the city utilities committees.

Maryland Commission Values Easements

Explains means of determining allowance to be given to this form of property of Baltimore Company

AS MENTIONED in the ELECTRIC RAILWAY JOURNAL for Feb. 4, the Maryland Public Service Commission has placed a valuation of $5,000,000 on the "easements" of the United Railways & Electric Company, Baltimore. The publication of the full opinion shows how the body reached this valuation.

The term "easements," as used in Baltimore is somewhat unusual. An extended explanation of the meaning of the term was given by the late W. G. Maltbie, special counsel of the company, on page 74 of the issue of this paper of Jan. 9, 1926. Briefly, it means a tangible interest which the company owns in the space on the streets occupied by its cars while in operation. Under the Maryland law the easement value is distinct from and in addition to the franchise value, or the right of the company to operate cars. The Maryland courts have held that such easements are property and subject to taxation. The company naturally claims that their value should be included in valuations for rate-making purposes.

Originally the company placed the value of its easements and private rights-of-way at between $18,000,000 and $19,000,000. This figure was cut by the Maryland Public Service Commission to $7,000,000, but on the claim of the people's counsel, this figure was disallowed by the Maryland Court of Appeals on the ground that it has been fixed, at least in part, on the basis of the earnings of the property. This method, the court held, was erroneous because: "The greater the earnings, the larger the value of the easements. The greater the value of the easements, the larger the fare returns that must be allowed on such value." The case was therefore remanded for determination without consideration of this element.

In announcing its revised value of $5,000,000 the commission explains the method by which this figure was determined and points out that earning capacity is in no way a factor. Briefly, the easement strip is considered as real estate and its value determined by comparison with that of adjacent real estate. To this value, a so-called percentage-use factor is applied, on the theory that while the cars use the streets, other vehicles do also. This percentage-use factor by the railway is taken as 25 per cent where the rights of the company are not exclusive. In this way a total of $5,113,632 was obtained as the approximate value of easements and private and semi-private rights-of-way. For the purposes of the present valuation this sum was taken as $5,000,000. As the commission had previously found the value of the property, exclusive of easements, was $70,000,000, as of Dec. 31, 1923, it placed the total value of all property, including easements, at $75,000,000 as of the date mentioned.

Counsel Attacks Holding Company Plan at St. Louis

Former Judge Henry S. Priest, counsel for the Tilles Non-Sectarian Foundation Fund, a minority stockholder of the St. Louis Public Service Company, on Jan. 23 asked the Missouri State Public Service Commission for permission to intervene in the hearing on the application of the City Utilities Company for permission to hold more than 10 per cent of the stock of the railway.

Mr. Priest, formerly counsel for the defunct United Railways, in a letter to City Counselor Muench assailed the explanation given recently by Stanley Clarke, executive vice-president of the railway, that the holding company could greatly aid the operating company in financing and other problems as an "impeachment of the local management," and further said that explanation of financial aid was ridiculous. Mr. Priest said:

> Its resources are invested in the stock of the domestic company, and if the direct obligation of the domestic company, supported by all its assets were not available for credits, surely its shares of stock alone would not be appealing.
>
> On its face it appears to be a device for pensioning some of the favorites of the foreign corporation at the expense of the domestic company.

City Counselor Muench of St. Louis, Mo., in a motion filed with the Missouri Commission charged that if the application is granted the holding company could obtain virtual control of the operating company and create obligations of its own with the stock and securities of the St. Louis Public Service Company as collateral without any supervision from the commission or other Missouri officials.

Sale of Electrical Equipment Approved

Stockholders of the Stark Electric Company, Alliance, Ohio, approved proposed action of the company's directors to sell electrical equipment to the Alliance Power Company, at an annual meeting held at Alliance. Approval was given after the stockholders had heard an optimistic report on 1926 operation. The sale has been approved by state officials.

Foreclosure Case at Chicago to Be Pleaded in June

Recent reports that foreclosure proceedings will be initiated against the Chicago Railways were confirmed on Jan. 21, when James H. Wilkerson, judge of the Federal District Court of Chicago, instructed attorneys for the company and for the various security holders' protective committees to be prepared to plead their cases at a trial next June. The Chicago Railways operates the north and west side surface lines. It has been in receivership under the jurisdiction of Judge Wilkerson's court since its twenty-year franchise expired last February and the payment of principal and interest on its bonds was defaulted. Henry A. Blair, J. J. Mitchell and Fredrick Rawson were appointed co-receivers at that time by the federal court.

The suit will not interfere with the franchise negotiations between the Surface Lines and the city, according to Attorney H. K. Tenner, who represents the Chicago Railways first mortgage bondholders.

Two New Directors Added to West Penn Electric Board

At meetings of the boards of directors of The West Penn Electric Company, West Penn Power Company and West Penn Railways, held on Dec. 7, 1927, W. C. Robinson, Pittsburgh, was elected a director. Mr. Robinson is president and a director of the National Metal Molding Company and is also a director of The Union Trust Company of Pittsburgh and the Mellon National Bank.

At a meeting held in New York on Jan. 4, 1928, Thomas H. Blodgett was elected a director. Mr. Blodgett is president of the American Chicle Company, New York.

Progress Reported on Washington Merger Negotiations

Negotiations for bringing about a merger of the Washington Railway & Electric, the Capital Traction and the Washington Rapid Transit companies have been resumed by committees representing the three companies and their counsel.

It has been emphasized that a merger of the Potomac Electric Power Company with the railway utilities is positively forbidden by an act of Congress and its consolidation with the railway companies, therefore, has never been discussed in the conferences.

Sale of Morris County Traction Confirmed

Federal Judge Runyon has confirmed the sale of the property of the Morris County Traction Company to its bondholders for $280,000. The railway, since replaced by buses, was sold under foreclosure at Morristown on Oct. 31, 1927.

Following the purchase, negotiations were consummated with the Public Service Transportation Company to replace the trolleys with buses, and this service between Newark and Morristown, was started Feb. 5.

The Public Service, it is said, will become owner and operator of the line.

New Director in Columbus

Lyle Babbitt has succeeded H. S. Holton as a director of the Columbus Railway, Power & Light Company, Columbus, Ohio.

Baltimore Company Passes Dividend to Conserve Cash

Directors of the United Railways & Electric Company, Baltimore, have passed the current quarterly dividend. It was explained by Charles D. Emmons, president of the company, that the action was taken because the dividend was not fully earned, the surplus in 1927 applicable to dividends being equivalent to $1.17 a share, while the disbursement called for $2 a share. The amount available for dividends was $682,000, or $136,446 less than the amount required. During the year ended Dec. 31, 1926, the dividend was earned by the company with $196,606 to spare.

President Emmons pointed out that the company's operating costs, materials, wages and taxes have doubled since before the war while fares have increased less than 50 per cent. The public pays twice as much for nearly everything it uses, he said, but this is not true of car fares. He said:

> The company tried to live on a lower fare, but additional increased costs, accompanied by falling off in traffic, compelled the company to apply for relief to the Public Service Commission. The rate case was necessarily, in the public interest, a long and exhaustive one before relief could be granted, and it became necessary to take the action we did.

The statement of income of the company for the year ended Dec. 31, 1927, before adjustment of books for both 1927 and 1926 is as follows:

	1927	Increase
Passenger revenue	$15,956,013	*$527,909*
Other revenue	233,727	1,941
Totals	$16,189,741	*$525,967*
Operating Expenses:		
Way and structures	$841,535	*$17,328*
Equipment	907,550	*1,136*
Power	1,387,832	*63,964*
Conducting transportation	5,143,117	*71,305*
Traffic	15,474	11,136
General and miscellaneous	1,535,354	12,058
Transferred for investment—Cr	16,025	*1,445*
	$9,814,839	*$131,994*
Depreciation	809,487	*26,298*
Totals	$10,624,326	*$158,293*
Net operating revenue	$5,565,415	*$367,674*
Taxes	1,593,143	*95,253*
Operating income	$3,972,271	*$272,421*
Non-operating income	159,230	34,086
Gross income	$3,131,502	*$238,334*
Fixed charges	2,889,315	64,427
Remainder	$1,242,187	*$302,762*
Interest on income bonds	560,000	.....
Net income	$682,187	*$302,762*

The net income by months was as follows:

	1927	Increase
January	$72,128	$1,992
February	27,590	*15*
March	81,509	*21,408*
April	61,000	*20,048*
May	63,529	*41,331*
June	41,721	*81,539*
July	36,370	*83,541*
August	20,849	*39,779*
September	38,691	*40,596*
October	72,738	*21,396*
November	74,379	*20,695*
December	91,678	*34,400*
Totals	$682,187	*$302,762*

From the 1927 net must be deducted the whole or part of $240,000 in final adjustment for accident and power accounts.

Italics denote decrease.

Balance of New York State Railways $308,565

"I firmly believe that conditions will improve from now on and that securities of conservatively operated traction lines serving the larger municipalities will again gain favor with the investing public." With these words did James F. Hamilton, president of the New York State Railways, Rochester, N. Y., submit the annual report to the stockholders. The balance for the year ended Dec. 31, 1927, for dividends and surplus, as shown in the accompanying report, was $308,565 against $497,403 for the year previous.

SUMMARY OF OPERATIONS OF THE NEW YORK STATE RAILWAYS— YEARS ENDED DEC. 31

	1927	1926
Railway operating revenues	$9,879,150	$10,351,484
Railway operating expenses	7,058,067	7,263,755
Net revenue railway operations	$2,821,083	$3,087,728
Taxes	596,565	659,422
Operating income	$2,224,517	$2,428,306
Non-operating income	122,955	37,698*
Gross income	$2,347,472	$2,390,607
Deductions:		
Interest on bonds	$1,290,294	$1,292,994
Other interest and deductions	218,086	243,606
Total deductions	$1,508,381	$1,536,601
Net income	$839,090	$854,006
Appropriations:		
For sinking fund	$30,525	$31,603
For depreciation reserve	500,000	325,000
Total appropriations	$530,525	$356,603
Balance for dividends and surplus	$308,565	$497,403

*Adjustment of excess of specified return under service-at-cost contract, City of Rochester.

The company entered into an agreement with the City of Rochester to operate the new subway railroad constructed by the city at a cost of upwards of $12,000,000. Under the terms of this contract the company is to provide the necessary rolling stock for passenger and freight service and pay the cost of operation and maintenance, after which any surplus or deficit is to be applied as provided in the existing service-at-cost contract which governs this service. The city assumes all interest and other fixed charges including taxes. In conjunction with this arrangement, agreements are being entered into with the various steam railroads entering the city providing for the movement of freight cars to and from commercial sidings located on the subway railroad and also the transfer cars from one railroad to another.

COMBINED SUMMARY OF OPERATIONS OF AFFILIATED BUS COMPANIES OF NEW YORK STATE RAILWAYS— YEAR ENDED DEC. 31, 1927

Gross revenues	$601,362
Operating expenses	532,968
Net operating revenue	$68,393
Taxes	13,129
Operating income	$55,264
Deductions	18,613
Available for depreciation and surplus	$36,650

In order to protect its interests and to avoid heavy expenditures incident to the construction of track extensions necessary to supply demands for service in outlying districts, the New York State Railways started auxiliary bus service to supplement and extend its trolley service in and about the cities in which it operates. The company's investment in bus lines amounted to approximately $650,000 on Dec. 31, 1927. In addition to furnishing service to outlying districts the establishment of cross-town bus lines in the City of Rochester has permitted the discontinuance of unprofitable long-haul trolley operation without loss of traffic. The revenues from operation of buses amounting to $600,000 are not included in those of the New York State Railways but are set out in a separate statement.

Due to the company's inability to finance capital expenditures through the issue and sale of its securities it has been necessary for several years past to use all available funds for that purpose, and this accounts for the deferment of dividends on the company's preferred stock.

The report referred to the enforcement of more stringent parking regulations in the business centers and said this must react to the benefit of city railway lines. Mr. Hamilton also mentioned the possibility that the present paving law would be amended to relieve the electric railways of at least part of this unfair burden.

3.91 Miles in New Hampshire to Be Abandoned

The New Hampshire Public Service Commission has granted authority to the Massachusetts Northeastern Street Railway to abandon 3.91 miles of track in Plaistow and Newton. Unprofitable operation was claimed.

Kansas City Bonds For Sale

The Kansas City Public Service Company, Kansas City, Mo., has applied to the Missouri Public Service Commission for authority to issue $2,634,000 of first mortgage gold bonds, series A. These are to be sold for not less than 88 per cent of par value and the proceeds will be used to refund obligations of the company.

Subscribers in Providence From Ranks of Employees

Employees of the United Electric Railways and the Narragansett Electric Company, Providence, R. I., have subscribed to $701,700 or 6 per cent cumulative preferred stock in the New England Power Association. The subscription price was $100 per share. Employees will pay in installments of $2 a share per month, deducted from the subscriber's salary.

Would Discontinue Line in Santa Barbara

The Santa Barbara & Suburban Railway has applied to the California Railroad Commission for permission to discontinue operation of its State Street bus line run in the city of Santa Barbara.

Collateral Trust at Chicago Reports Loss

The Chicago City & Connecting Railways Collateral Trust, Chicago, Ill., reports for the year ended Dec. 31, 1927, net loss of $1,077,844 after charges. This loss is due to the fact that with the expiration of their franchise, the Chicago City Railway and the Calumet & South Chicago Railway stopped payment of dividends on Feb. 1 last. B. E. Sunny, chairman of the protective committee, states the companies have set aside for the benefit of stockholders the equivalent of the dividends not paid.

Stock Reduction in Wisconsin Company

An 80 per cent stock reduction was voted at the annual stockholders meeting of the Wisconsin Rapids Street Railroad, Wisconsin Rapids, Wis.

Earnings of Eastern Massachusetts Fluctuate

Receipts of the Eastern Massachusetts Street Railway, Boston, Mass., last December were almost $100,000 less than in the corresponding month in 1926, whereas the receipts in December, 1926, were about $95,000 higher than in December, 1925. Last December there was no snow, so that the company had no snow expenses, but people were operating their automobiles and did not use the street cars. During December, 1926, however, there was so much snow that automobiles were not used to the usual extent.

During 1927 the Eastern Massachusetts earned its dividend requirements on the first preferred and on preferred B stock, but failed by about $93,000 to earn the $5 a share paid on the 86,842 shares of adjustment stock, so that the net available for dividends on this issue was only $4 a share. The net income of $772,060 available for dividends in 1927 was greater than that of either of the two preceding years. Operating revenues decreased $190,000, but there was an increase in net of $37,000 over the previous year.

New Director on Atlanta Board

Andrew C. Erwin was recently elected to the directorate of the Georgia Power Company, Atlanta, Ga., to succeed the late J. P. Phinizy. Mr. Erwin is a prominent business man of Athens. He is well known in the public affairs of the state.

Book Reviews

In Retrospect

Conspicuous in the land of books in 1927 affecting public utilities was the production of reading matter relating to finance. This, of course, is indicative of the present day need for a thorough understanding not only on the part of utility managements but also on the part of the layman of the principles involved in speculation, stock ownership, profit sharing, accounting practices, and depreciation. One brave ameliorist, Professor William Z. Ripley, caused a stir with his "Main Street and Wall Street" (Little Brown & Company). However, he is no more intent upon rectifying certain corporate practices than are many exponents of the industry itself. From his comments something can be gleaned. Again, much can be gained from a perusal of "The Principles of Bond Investment" (Henry Holt & Company) by Chamberlain and Edwards. This work is popularly known as "The Bible of Wall Street." Here is finance brought up to date after a trying period of war, radical changes in the taxation system and the wholesale weeding out of passé stock.

"The Claim Agent and His Work" by Smith R. Brittingham (Ronald Press Company) deserves the attention of electric railway managers. But by far eclipsing the rest of the crop in volume, interest and perspective is Martin G. Glaeser's "Outlines of Public Utility Economics" (Macmillan Company) with its comprehensive task of presenting the economic problems of all of the public utilities taken as a group. The author is a professor of economics at the University of Wisconsin and research associate, Institute for Research in Land Economics and Public Utilities.

In addition to the volumes covering general engineering subjects, business conditions, wages, employment, economics and the like, there were a few which appealed to popular fancy in the industry. For his observation on the American workman, the reviewer reached a rapprochement with André Siegfried in "America Comes of Age" (Harcourt, Brace & Company). All protagonists of American industry would find both pleasure and enlightenment in this discerning Frenchman's views. The story of business a generation ago with its unbridled rivalry is told in "Captains in Conflict" (A. W. Shaw Company). Here is an epoch in business in the making which might serve as inspiration to the present-day leaders.

Another book in somewhat lighter vein is Frank Folupa's "Notes on the Collection of Transfers" (Dorrance & Company). The reader may not be a "peridromophile," but he would probably be amply repaid for time consumed on reading about the habit of collecting transfers.

These books and numerous others were reviewed in the ELECTRIC RAILWAY JOURNAL in the second issue of each month, during the past year. Reference can be made here to only a few of them, but it has been the desire to satisfy all types of readers. In some respects the task was as difficult as that which confronted the essayist who was to pick stories to please three old ladies at one and the same time. The first lady was practical, the second was fond of fun and the third was romantic.

Heinrich Bussing und Sein Werk

(Henry Bussing and His Work)—25th anniversary publication, by the Automobilwerke, H. Bussing A. G. Braunschweig, Germany, 92 pages of text and 262 illustrations.

Mr. Bussing's work during the past twenty-five years has been the manufacture of buses and commercial cars. So well has he done this work that his name is known throughout Europe and only to a lesser extent in America. The present volume is in part historical and in part relating to the Braunschweig Works. Most of the book, however, is devoted to particulars of recent designs which vary all the way from ice wagons to luxurious double-deck touring buses. The book is beautifully printed and bound.

Five Thousand Sheet Steel Products and Who Makes Them

Sheet Steel Trade Extension Committee, Pittsburgh, 445 pages, price $3.

The book is essentially a directory of sheet steel products and fabricators. The compilers of it advise that "heretofore there has been no publication of any kind to which one could turn to find all of the manufacturers of sheet steel, all of the fabricators of products made from sheet steel, and the names of these products."

The cover of the new book is done in blue, silver and gray. In addition to the preface, the table of contents includes the following: "Brief History of Iron and Steel"; "U. S. Standard Weights and Gages for Iron and Steel Sheets"; "List of Simplified Types, Gages and Size of Sheets"; "Manufacturers of Sheet Steel with Index to Their Advertisements"; "Fabricators—Alphabetical List of"; "Fabricators—Alphabetical List by States"; "5,000 Sheet Steel Products and Who Make Them"; and "Sheet Steel Products with Index to Fabricators Who Make Them." The brief history of iron and steel contains more than a dozen illustrations. This useful and handy directory is calculated to find a welcome place in business libraries and on the desks of purchasing executives.

Electric Control Gear and Industrial Electrification

By William Wilson, M.Sc., B.E., M.I.E.E., A.A.I.E.E. Oxford University Press, London, England. 362 pages. Price $8.50.

Extensive use of electricity for driving shop tools has led the author to compile a volume on the control apparatus itself. Special attention has been given to present the information in such a form as to be understood readily by the type of engineer usually connected with this work. The book, however, is concerned primarily with the design, arrangement and construction of the controlling apparatus. Each chapter as far as possible is complete in itself and can be read and understood independently of those that come before and after. Diagrams used are made easily intelligible.

Readers who are studiously inclined have been kept in mind and certain specialized sections have introductions to familiarize the reader with the subject and so not require reference to other text books.

The book is well illustrated and gives examples of various installations. There are 23 chapters and numerous tables. Chapters on electric crane and control systems for them and upon machine tool control should be of particular interest to electric railway shop men.

Trade Association Activities

Bureau of Foreign and Domestic Commerce, Department of Commerce—Superintendent of Documents, U. S. Government Printing Office, Washington, D. C.,—383 pages—75 cents.

Secretary Herbert Hoover covers the purpose of the government when in the foreword he says that the purpose of this and the 1923 volume on Trade Association Activities is to indicate the successful service of trade associations in public interests. That in the field of scientific and economic research, in statistics, in simplification and standardization of commodities, in the promotion of arbitration in commercial disputes, in development of foreign trade, and in scores of other directions, trade associations have made a valued contribution to economic progress.

The publication discusses in detail the following phases of trade association activities: the organization problems of trade association and the way in which these are commonly met; the legal status of the statistical activities of trade associations; service of trade associations in promoting uniform cost accounting; the encouragement of co-operative research by trade associations; simplification and standardization in industry; public relations and co-operative advertising; trade relations and arbitrations; and a detailed treatment of trade associations in connection with the industries which they represent. The text closes with an outline of the vast number of contacts which trade associations maintain with the federal government.

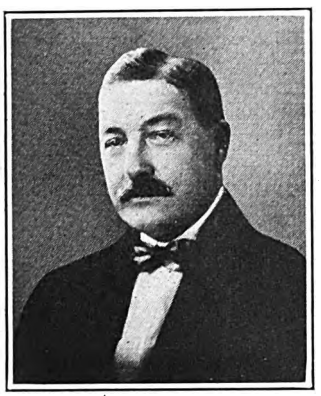
Personal Items

A Record Holder

"Bob" O'Brien of New Orleans heads Association of Equipment Men Southern Properties, which he helped to found

ELECTION of Robert M. O'Brien to the presidency of the Association of Equipment Men, Southern Properties, at the recent meeting of that organization in New Orleans marks the elevation to that post of another of the small group of far-sighted Southern equipment men, who in 1922 conceived the idea of organizing to interchange ideas on practices and to compare costs so as to stimulate improvement in their own performance. Mr. O'Brien, New Orleans, joined forces with A. D. McWhorter, Memphis, W. H. McAloney,



R. M. O'Brien

Atlanta, and A. Taurman, Birmingham, and the association was born which has since grown to proportions undreamed of by its founders.

"Bob" O'Brien has been the storm center of discussion throughout the South ever since he proceeded to romp off with the honors in the Southern Association's pull-in contest. At first there was general scepticism regarding New Orleans' performance. Then the Southern Association adopted a rigid definition of a pull-in, but New Orleans continued to lead by a wide margin. In addition to having what is probably the lowest pull-in record in the country, New Orleans has an equipment maintenance cost that is well down below the average.

One looks in vain for spectacular "stunts" that might explain this performance. There are none, except that for the 39 years "Bob" O'Brien has been with the New Orleans Public Service Company and its predecessors, he has pounded away at the work of gradually developing one central idea regarding the maintenance of electric railway equipment until it has permeated to the lowliest man in his department. "Our business is so to maintain equipment that it will not fail in service—not to repair it after it has failed," he insists. That's all there is to it, except that Bob stays close enough to the job to see that this idea is put into practice.

"Bob" O'Brien has lived in New Orleans all his life. He is now 54 years old, but he has worked for one company since he started as a lad of fifteen in the power house of the old Louisiana Electric Light Company. After four years he was in charge of the company's meter department as foreman, but in 1893 he went into the Arabella Station of the New Orleans City & Lake Railway as a car doper. In 1894 he became night foreman of the Poland car station. In 1898 he moved up a notch as day foreman. In 1901 the New Orleans Railway & Light Company was formed by consolidation and in 1907 "Bob" became foreman of Claiborne station. A year later he was moved to a similar position in Arabella station, the largest house on the system, and in that same year became inspector of equipment. In another year he became assistant superintendent of the railway, and in 1913 was made superintendent of equipment by M. S. Sloan, then general manager of the property at New Orleans.

The entire department of which he is the head is concerned primarily with maintenance work, but during the past several years a staff of young engineers has been developed in his department to supplement and reinforce the practical maintenance forces. Mr. O'Brien is a firm believer in eliminating all manufacturing activity from a maintenance shop, on the principle that home manufactured parts are false economy. As president of the Association of Equipment Men, Southern Properties, he may be expected to support the principle that since the manufacture of electric railway parts is work for specialists, the operating executive should concentrate on getting the best possible performance from equipment instead of going into competition with the manufacturer, who is trying to help reduce costs.

C. E. Mitten Goes to Philadelphia

Clarence E. Mitten has been transferred to Philadelphia, Pa., to take charge of the new business department of the Philadelphia Rapid Transit Company and associated companies. He has been passenger traffic manager of the International Railway at Buffalo since early last year. In that capacity he handled both electric and bus transportation and reported direct to President Yungbluth. Mr. Mitten went to the International Railway organization from the Chicago & Eastern Illinois Railroad where he had twenty years of experience. In that organization his last position was assistant superintendent of transportation.

Simon Glerum Is Advanced at Grand Rapids

At the annual meeting of the directors of the Grand Rapids Railroad, Grand Rapids, Mich., in January a new office was created, and in recognition of twelve years of faithful and efficient service Simon Glerum was chosen for the new place, assistant secretary and assistant treasurer.

Mr. Glerum has filled many positions with the Grand Rapids company. From stenographer in the general offices he advanced until he became private secretary to L. J. DeLamarter, vice-president and general manager. In all of these positions Mr. Glerum has proved his efficiency, loyalty and courtesy, says Mr. DeLamarter. He is well known in the industry.

Mr. Glerum was born in Grand Haven, Mich. He was graduated from the local public schools and was former

Simon Glerum

private secretary to Congressman Carl E. Mapes of Michigan. This early training gave him a good foundation on which to build and his application to his duties with the railway operating in Grand Rapids has commanded the regard of the directors.

East St. Louis Roads Elect

F. W. Doolittle, New York, was elected president of the East St. Louis & Suburban Railway, East St. Louis, Ill., Jan. 24 at the annual meeting of the board of directors in East St. Louis. Other officers elected or re-elected were: G. W. Welsh, vice-president; T. W. Gergory, vice-president and secretary; R. Sealy, New York, treasurer; Lieut.-Col. Frank L. Reardon, assistant-secretary and treasurer; F. H. Piske, New York, assistant secretary; Miss Eugenia E. Sunkel, assistant treasurer. The same officers were also named by the directors of the St. Louis & Belleville Electric Railway and the St. Louis & Alton Railway, subsidiaries.

Mr. Doolittle, for a long time vice-president of the North American Company, which controls the East St. Louis Company, succeeds W. H. Sawyer as president. Mr. Sawyer resigned as president on Oct. 14 to become president

Digitized by Google

of Stevens & Wood, Inc., of New York. Following the resignation of Mr. Sawyer, Mr. Doolittle assumed the duties of president. A biography of Mr. Doolittle was published in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 22, 1927, page 806.

The action taken by the directors of the railways at the annual meeting changes the status of T. W. Gregory, formerly vice-president and assistant secretary; Lieut.-Col. Frank L. Reardon, formerly assistant treasurer, and Miss Sunkel, formerly secretary to Vice-President Gregory.

Mr. Gregory, newly elected secretary, has been with the affiliated companies since 1902. He was appointed receiver of the Alton, Granite City & St. Louis Traction Company in December, 1925, and receiver of the Alton Gas & Electric Company on Dec. 22, 1925.

After his re-election as vice-president of the railways G. W. Welsh was appointed general manager by the president, giving him the title of vice-president and general manager. Mr. Welsh was with the General Electric Company from 1901 to 1905, in the testing department, specializing particularly in electric railway operation. From 1905 to 1909 he was with the New York Central Railroad in connection with the electrification of the Grand Central Terminal in New York City. Subsequently he worked with the Southern Pacific Company, San Francisco, on the electrification of suburban lines on the eastern side of San Francisco Bay, in Oakland and Berkeley. In this endeavor he was employed from 1909 to 1914.

Miss Sunkel was the first woman employee of the East St. Louis railways. She began as assistant cashier 24 years ago. Later she held various posts in the accounting department and has been secretary to Vice-President Gregory for ten years. She will be eligible next year to membership in the Twenty-five Year Club and will be the only woman member of that organization for several years to come.

William Stewart at Omaha

William Stewart has accepted the position of private secretary to J. N. Shannahan, president of the Omaha & Council Bluffs Street Railway, Omaha, Neb. Mr. Stewart entered the railway field in 1899 as chief clerk in the signal and maintenance of way departments of the New York Central & Hudson River Railroad at Albany, N. Y., in which capacity he served until 1901, when he accepted a position as purchasing agent and secretary to the general manager of the Fonda, Johnstown & Gloversville Railroad at Gloversville, N. Y. From 1907 to 1912 he was purchasing agent and secretary to the general manager of the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md. On Jan. 12, 1912, he was elected secretary and treasurer, as well as purchasing agent of the Newport News & Hampton Railway Gas & Electric Company at Hampton, Va., now known as the Virginia Public Service Company.

Westinghouse Executives Promoted

W. J. Longmore has been transferred from the office of general purchasing agent of the Westinghouse Electric & Manufacturing Company to consulting supervisor of purchases; E. R. Norris, from director of works equipment to general works manager of all manufacturing operations; A. W. Bass, from director of works records and statistics to assistant to the vice-president; S. E. Marks, from director of traffic and shipping to director of traffic; and C. G. Taylor from director of purchases to general purchasing agent.

Mr. Longmore is a veteran of the company, being perhaps the oldest in continuous service. He entered the employ of the Westinghouse interests in 1881 as a laborer.

Mr. Norris began his connection with the company in 1892 as a general mechanist at the Newark works.

Mr. Bass has had a wide experience outside the company. In 1921 he was made director of works records, the position he held until his recent promotion.

Mr. Marks entered the employ of Westinghouse in 1891 in the purchasing department.

Mr. Taylor became connected with the Westinghouse Company in 1887.

D. F. Miner has recently been appointed manager of material and process enginering department of the Westinghouse Electric & Manufacturing Company. Mr. Miner was first employed by the company in 1919 as an assistant to the section engineer of the electrical section. Since 1920 he has served in the capacity of section engineer of the experimental section of the material and process engineering department.

Allyn B. Tunis Will Direct Virginia Information Bureau

Allyn B. Tunis will direct the recently organized Virginia Committee on Public Utility Information, with headquarters in Richmond, Va. Mr. Tunis knows the newspaper and publicity business. He first worked as a reporter on the *Ledger-Dispatch* at Norfolk. Later he became city editor of the *Times-Dispatch* at Richmond. For two years he was on the copy writing staff of Cecil, Barreto & Cecil, Inc., advertising agents of New York and Richmond. Mr. Tunis served for five years as agent of the Chesapeake & Ohio Railway public relations department.

It was from the copy desk of the Richmond *News Leader* that Mr. Tunis resigned to take up the duties of secretary of the Public Utilities Association of Virginia and to hold at the same time the position of director of the new information bureau in Richmond.

Mr. Tunis is a native of Maryland. He was born on July 4, 1888.

C. P. BILLINGS, after nine years' service in various capacities with the West Penn System, Pittsburgh, Pa., has severed his connection with that company to go with the Electric Bond & Share Company, New York City. During his connection with the West Penn Electric Company, Mr. Billings served as vice-president and general manager of the Wheeling Traction Company, vice-president of the West Penn Company and vice-president of the West Virginia Power & Transmission Company.

GEORGE GRANT PORTER, at one time connected with the New Jersey & Hudson River Railway & Ferry Company, Edgewater, N. J., is now mechanical engineer of the DeRemer-Blantchford Company, a railway supply concern at Chicago, Ill. Several years ago Mr. Porter was active in railway work. His first experience was with the Pullman Company where he remained for seven years. Later he was employed with the West Chicago Street Railway and subsequently went abroad where he worked for the George F. Milnes Company, Ltd., car builders, and later for the London Underground Railways. On his return to this country he became associated with the New Jersey & Hudson River Railway & Ferry Company as master mechanic. This property is now part of the Bergen division of the Public Service Railway of New Jersey. Mr. Porter's experience covers steam and electric railroading, bus projects in London and in the United States and public relations activities.

Obituary

F. G. Simmons

F. G. Simmons, former superintendent of the Denver Tramway, Denver, Col., died on Jan. 20 at Milwaukee, Wis. Mr. Simmons moved from Denver to Milwaukee many years ago and became prominent in utility enterprises and political movements He served as superintendent of way of the Milwaukee Electric Railway & Light Company and assumed other positions with that property. Early in his career he was an apprentice in the shops of the Denver & Rio Grande Railway and later took a course in civil engineering. He was connected with the Denver City Tramway for nine years in charge of track.

Most of Mr. Simmons' boyhood was spent at Niagara Falls. He was educated at St. Catherines, Ont. He was vice-president of the American Electric Railway Engineering Association for three years and was president of the association for one year. In 1912 he was a member of the committee on standards of the American Electric Railway Association.

W. R. DAUM, president of the railway property in Ottumwa, Iowa, for many years, died on Jan. 25 in his home after a long illness. He was 77 years old. It was during his term of service with the company that the lines in Ottumwa were electrified.

Manufactures and the Markets

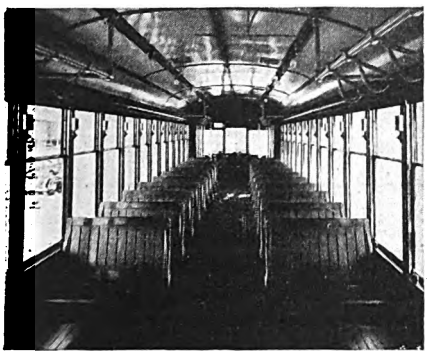
First of Twenty New Cars for New Orleans Arrive

The first of the twenty new cars for the New Orleans Public Service, Inc., were delivered on Jan. 23. Ten of the cars were built by the St. Louis Car Company, and ten by the Perley A. Thomas Car Company. Previous mention of the order was made in the JOURNAL for Aug. 20, Oct. 15, and Jan. 28. Each car has a seating capacity for 52 passengers, and a total weight of 40,000 lb.

The interior trim is in cherry. They are all-steel one-man, two-man, double-truck double-end cars and are equipped with four treadles per car—one in each corner on account of operating conditions in Canal Street in New Orleans. Ten of the units are equipped with four GE-265-G and ten with Westinghouse 510-E motors.

Complete specifications of these cars were published in the Oct. 15 issue of the JOURNAL.

These cars are merely a small part of the extensive plan of rehabilitation of the property at New Orleans entered upon since the company there passed to the group operated by the Electric Power & Light Corporation.



Interior view of one of the twenty cars for the New Orleans Public Service, Inc.

Twenty-five Articulated Units for Cleveland Railway

Twenty-five articulated units were ordered by the Cleveland Railway on Jan. 13 from the G. C. Kuhlman Car Company, Cleveland, at a contract price of approximately $450,000. One sample unit manufactured last summer and exhibited at the American Electric Railway Association convention in Cleveland last fall is included in the order.

The total cost of each unit will be approximately $29,000, according to Joseph H. Alexander, president of the Cleveland Railway. Motors, furnishings and all equipment except seats have been purchased.

Under the contract with the G. C. Kuhlman Car Company, deliveries on the articulated cars are to be made at the rate of five a week, starting 90 working days after the receipt of the order.

Purchase of the articulated cars was made under the authority of the Cleveland City Council. This is the first time that the Cleveland Railway has gone into the market to buy motor cars since 1923.

De Luxe Double-Deck Car Suggested by Peter Witt

Peter Witt, Cleveland, expects to exhibit a model of his projected double-deck street car at the American Electric Railway Association convention in Cleveland next September. He has asked twenty railways throughout the country to contribute $500 each for the construction of one of the cars, and has received favorable replies from six companies, so far. Parlor car seats and smoking privileges on the top deck are planned for the car, since Mr. Witt believes passengers will be glad to pay an extra fare for the luxury and comfort thus afforded.

He has not approached the Cleveland Railway with a request to take part in the financing of the first car because any such expenditures would, under the service-at-cost plan in effect there, have to be approved by the City Council. He does, however, hope to have the Cleveland Railway operate the car in experimental service so as to provide data on which to judge its performance. If the model car proves to be a success, Mr. Witt expects to sell it at the convention and return the money advanced by the various railways. Some of the tentative specifications of the car were published in the JOURNAL for Feb. 26, 1927, page 370.

Motor Division Created by G. E.

Announcement of the creation of a motor division of its industrial department has been made by the General Electric Company. The new division will have general supervision of all policies, prices, etc., concerning all motors handled by this department.

Metal Buying Moderate at Slight Price Concessions

The general tone of the metal market is quiet, with prices slightly easier on Feb. 8 than a week ago. The situation in copper and lead is practically unchanged since early in December; zinc has declined slightly in the two months; and tin is several cents lower, a condition that is beginning to stimulate sales.

Copper sales were very satisfactory on Feb. 1, 2, and 3, with the result that members of the producing group that has been holding for some time at 14⅛ cents delivered in the East and 14.25 cents in the Middle West were able to book several orders at those levels. A large buyer entered the market for prompt shipment, cleaning up much of the spot copper in sight at varying prices between 14.075 cents and 14.125 cents. The lower quotation mentioned has been made by one seller all week, and the market in the last two days has settled down to that level, so far as actual business is concerned, the 14⅛ cents, Valley, quotation of the large producing interests being largely nominal for the time being. The foreign market has been quiet so far this month, at unchanged quotations of 14½ cents, c.i.f.

Zinc quotations for the last two months have fluctuated within the narrow limits of 5.60@5.70 cents, with little zest in the market. Spot lots of High-Grade are nominally unchanged at 7¾ cents for Eastern deliveries.

A comparatively small quantity of lead changed hands during the week ended Feb. 8. Prevailing prices have been 6.50 cents, at which figure the American Smelting & Refining Company has maintained its contract price in New York, and 6.225 cents in St. Louis. Some metal has been available at 6.20 cents in the Middle West, but the tonnage is not large, and, on the other hand, 6.25 cents has been realized on a number of miscellaneous orders.

Tin continues its downward course, and prices are now lower than at any other time in the last three years. Since Jan. 2 Standard tin in London has declined £28 for spot and £24 for futures. Today a contango of £2 prevails, instead of a strong backwardation. Tin of 99 per cent grade is not plentiful, nor is it as scarce as it was a week ago, and the spread between the two grades is upward of ½ cent.

The afternoon of Feb. 8 buying became active and 800 to 1,000 tons was sold, the price for Straits advancing during the day from 52¾ to 53¼ cents.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

Metals—New York	Feb. 7, 1928
Copper, electrolytic, cents per lb.	13.85
Copper wire, cents per lb.	16.125
Lead, cents per lb.	6.50
Zinc, cents per lb.	5.988
Tin, Straits, cents per lb.	53.125
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	.....
Somerset mine run, Boston, net tons	.....
Pittsburgh mine run, Pittsburgh, net tons	.....
Franklin, Ill., screenings, Chicago, net tons	1.75
Central, Ill., screenings, Chicago, net tons.	$1.50
Kansas screenings. Kansas City, net tons	2.125
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	5.30
Weatherproof wire base, N.Y., cents per lb.	16.50
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.2
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal.	$0.645

vice-chairman of the Yellow Truck & Coach Manufacturing Company, it is reported, has been elected chairman of the board of that company.

Thomas B. Hogan has been made vice-president and manager of the Cab Company. He was assistant to Mr. Gray. Albert D. Lasker and Alfred Ettlinger have been elected to fill vacancies on the board of directors of the Cab Company.

Changes in Personnel of Yellow Truck Company

John Hertz, according to recent advices, resigned as chairman of the board of the Yellow Truck & Coach Manufacturing Company on Jan. 17 to accept the presidency of the Chicago Yellow Cab Company made vacant by the death of Charles W. Gray. He is now both president and chairman of the Cab Company. John A. Ritchie,

$1,036,598 Net Profit for Brill Company

For the year 1927, the combined output of the J. G. Brill Company's four plants amounted in sales value to $11,876,669. The combined output for each of the past eight years follows:

1920	$17,537,293
1921	7,647,898
1922	10,177,582
1923	18,167,486
1924	8,721,726
1925	9,101,909
1926	10,416,381
1927	11,876,669

After deducting from earnings all cost of operations, in which are included maintenance and repairs and depreciation for the year amounting to $631,726, and after setting aside out of earnings reserve for federal and state income taxes, not yet due, of $167,048, the result of the operations of all the plants of the company shows a net profit of $1,036,598 for the year.

The consolidated profit and loss and earned surplus accounts of the J. G. Brill Company and subsidiary companies for the year 1927 follows:

Total net sales billed		$11,876,669
Cost of sales, including operating, selling, administration and general expenses and depreciation for the year, less miscellaneous income		10,673,842
Operating profit		$1,202,826
Federal income and state taxes		166,228
Net profit to earned surplus		$1,036,598
Earned surplus at Dec. 31, 1926		$5,120,015
Surplus adjustments		
		$5,120,015
Add profit as above		1,036,598
		$6,156,613
Less dividends paid—preferred	$320,600	
common	240,510	561,110
Earned surplus at Dec. 31, 1927		$5,595,503

Bids for Buses Advertised at Detroit

The Department of Street Railways of the city of Detroit is advertising for bids for furnishing buses to be used in the extension of services of the municipal system. Bids are to be opened on Feb. 23, 1928, at the department's main office at St. Jean and Shoemaker avenues.

Proposals are invited for supplying from 15 to 25 buses capable of carrying 29 to 31 passengers each, equipped either with straight mechanical equipment or gas-electric equipment.

From 25 to 50 buses are also specified of 37 to 41 passenger capacity with either straight mechanical or gas-electric equipment. All buses are to be of the street car type.

ROLLING STOCK

Northern Ohio Power & Light Company, Akron, Ohio, has recently ordered one 40-passenger A.C.F. all-steel metropolitan coach with gas-electric drive.

Oklahoma Railway, Oklahoma City, Okla., has purchased seven new 21-passenger buses for service in Oklahoma City.

SHOPS AND BUILDINGS

Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., has opened a new ticket office and depot at National and First Avenues in Milwaukee. The office has been completely remodeled.

TRADE NOTES

Ohmer Fare Register Company, Dayton, Ohio, advises that it has completed final shipment of 559 No. 22 type Ohmer registers to the International Railway, Buffalo, N. Y., ordered for the accounting of revenue on city lines. The register company advises that with these machines going into service, the entire property, including the interurban and city cars, will be approximately 100 per cent Ohmer equipped.

ADVERTISING LITERATURE

Chausse Oil Burner Company, Elkhart, Ind., has issued an illustrated circular descriptive of its oil-burning tar kettles and torches.

Pyrometer Instrument Company, New York City, has issued a pamphlet "The Great Step Forward," emphasizing the advantages of its new simplified pyro optical pyrometer.

Crouse-Hinds Company, Syracuse, N. Y., is mailing Bulletin 2107, describing its pipe hangers, fixture hangers, unions and connectors.

Electric Railway Journal Wins National Award for Outstanding Service to Its Industry

THE award set up during the past year by the Associated Business Papers, Inc., to the business paper contributing the most definite and outstanding service to the field with which the publication is connected has been won by ELECTRIC RAILWAY JOURNAL. Announcement of this signal honor was made on Feb. 10 at a combined meeting of the National Conference of Business Paper Editors and the Educational Committee of the Associated Business Papers, Inc., held last Friday in Boston.

Briefs were submitted in this contest by 21 business publications serving as many different industries. The Associated Business Papers, Inc., which established the award, and under whose auspices the contest was conducted, includes in its membership 126 of the leading business papers published in the United States and Canada. The jury of award, consisting of Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, Department of Commerce, Washington, D. C.; James W. Brown, publisher *Editor and Publisher;* David Beecroft, vice-president Chilton Class Journal Company; William M. Richardson, chairman business paper committee American Association of Advertising Agencies, and W. A. Wolff, former president of the National Industrial Advertisers' Association, reached its decision unanimously.

IN announcing the award the committee directed attention particularly to the service rendered by the winning paper in assuming the responsibility of leadership and in campaigning courageously for practices and policies which were considered in the best interests of its industry. This campaign, the committee found, was carried out by articles, editorials and original investigations published in the paper, and by numerous speeches and talks made by members of the editorial staff. Through this activity the paper was instrumental in helping its industry to see in better perspective some of the conditions and practices which affect its welfare.

ELECTRIC RAILWAY JOURNAL is naturally gratified at being made the first recipient of this award which might be compared to the Coffin prize in the electric railway field. It is also pleased that it has been the means of drawing attention nationally, among business paper publishers, to the electric railway industry and to the heroic struggle which that industry has been making to overcome the seemingly insurmountable difficulties which all but overwhelmed it during the war and post-war periods. The story of the electric railway industry during the past decade is a story of industrial romance. It constitutes an epic of faith, courage and determination, maintained in the face of heavy and cumulative odds. The JOURNAL'S part has been that of inspiring the industry to greater effort and broader vision as one difficulty after another threatened to overwhelm it. But after all, it is the industry itself which is winning the battle. It is the industry itself, and the men who constitute its executives and leaders that have encouraged the JOURNAL in its program of pointing out the road toward progress; that have counseled with the paper's editors and have contributed their best thought to its columns.

The A.B.P. Award is therefore not so much an honor for the JOURNAL as for the electric railway industry. It is for that reason that the result of the contest is particularly gratifying. In sharing this recognition with its industry it is ELECTRIC RAILWAY JOURNAL'S hope that this may prove to be merely another milestone in the march of local transportation companies toward better public understanding of their problems and, in a measure, justification of the faith that inspired the industry's leaders to stick to their guns when the outlook was darkest.

Short Cuts Are Dangerous

BUSINESS has better control of the economic, social and financial forces that are at work in its intensely complicated structure than ever before in the history of the world. There is no question but that its ethical plane has moved upward constantly and that it may be expected to move still higher. But every now and then the pressure for profit leads individuals or business enterprises to attempt short cuts and to follow the lure of expediency rather than the clearly designated road of sound business principles.

These are the things that John D. Rockefeller, Jr., undoubtedly had in mind in his remarks on the occasion of his appearance before the Senate hearing in the oil investigation. In a few words he expresses a creed to which all business men, and particularly big business, may well subscribe:

"I believe in the business of the country. I believe that business can be run only on a sound, high, fair basis. As a stockholder in any company, I want no profit derived from compromise with right. I want no officer in any company in which I own stock, whether he be high or low as an employee, to do anything that I would not myself be willing to do."

These and other things that Mr. Rockefeller said have been widely quoted. His statement did his associates and the country at large a real service. It reflects with credit his vision and his appreciation of the consequence of any course that appears to defy vested authority or public opinion, however well fortified by legal barriers the case may be.

These things are recited in terms of Mr. Rockefeller's remarks only because he is the vehicle that happens to have directed widespread national attention to this sane and healthy viewpoint. Business integrity exists only as business itself puts it there. The electric railway industry long ago learned the folly of short cuts from sound principles. Its aim today is to earn a fair profit only as it may do so through a just return for a useful service rendered to the public, with adequate wages to its employees and with insistence upon those relations between employer and employee which recognize the rights of both. The progress that has been made by many properties in establishing an entente cordiale with the public on the one hand and their employees upon whom the success of their operations depend, on the other, testifies eloquently to the sound business wisdom of building for the future upon the bedrock of faithful service and fair dealing.

Repair Work That Is Worth While

FAR too often railway repair work is done without thought of the morrow. On some roads, when a car comes in off the line for minor repairs, the one thought of the foreman is to get it patched up and out again. Naturally as little work as possible is done on it. When the time comes for general overhauling—and it comes all too soon—there may be a miscellaneous collection of patchwork jobs that have been accumulated over a period of months. To leave them in place, provided they are in working order, is the easiest procedure, so the car frequently goes out after the overhauling with a lot of nondescript elements. As this is repeated from year to year each car takes on its own individuality, and it is almost impossible to get uniformity of equipment on any line.

Contrast this with the procedure on one Middle Western property, where a new manager found a situation such as that just mentioned. He has taken as his criterion for repair work the question: Will we want this part a year from now? As a result, when an old car is being repaired, it is looked over to see if all the parts taken off should go back, or if they should be replaced by improved parts. As a result, it has been found possible to eliminate many detail parts that have become obsolete and use in their stead equipment that represents the latest development that is available. Of course, it is not possible by this means to make every old car thoroughly modern. It is, however, possible to prevent the usual kind of patchwork and to obtain a measure of standardization that makes for over-all economy.

A Traffic Institute in the Making

ORGANIZATION of the American Electric Railway Association committee on street traffic economics promises for the industry and for the country a broad study of the fundamentals of street design and use that may well be expected to have nation-wide consequences. This committee is undertaking a work which is second in importance to few subjects that confront American communities, and one which puts the electric railway industry in the position of taking leadership in the interest of sound community development.

There has been the suggestion that the country needs a traffic institute through which there may be brought together, in the interests of the nation, that small coterie of men who by training and experience have a real insight into the fundamentals of the traffic problem. Such men are in a position to work out for the guidance of the country the principles upon which economically sound solutions of present intolerable traffic conditions may be predicated.

The thought is a good one. Too many communities have jumped to conclusions in adopting traffic remedial measures, and few if any have any clearly defined policy of developing transit to meet their growing need. These problems depend for a sound solution on an understanding of many factors in city development that are fundamental and upon which there is little public knowledge or understanding. Even experts are not agreed on some of the basic principles upon which the development of a sound traffic plan depends.

In a few cities men have come into the limelight who have led the way toward distinct improvement in traffic conditions because they have had real knowledge of the problem on the one hand and public confidence on the other. In Chicago, these men were acting officials of the street railway company. But they approached the problem in the interest of the public and not the selfish interest of their own company. Only through that attitude were they able to obtain the public support necessary for application of their ideas. The results accomplished, from the standpoint of public welfare as well as that of the transportation companies, have more than demonstrated the ability of these men to guide the city's traffic policies.

That such men as these, together with a group of engineers and executives as well qualified as any men in the country to speak with authority on traffic matters, have been brought together in the committee on street traffic economics is in itself assurance that the electric

Digitized by Google

railway industry is taking definite leadership in the solution of the baffling problems that the traffic situation presents. At the first meeting of the committee it was clearly indicated that its work is to be a distinct public contribution, and that the interests of the particular industry with which these men are identified will be secondary rather than primary in their consideration. Thus it may come about that the country will find itself provided with a traffic institute while the public at large is still thinking of how such an institution may be brought about.

Reaping the Reward of Good Work

FEW more striking evidences of the value of good will are to be found than the prompt response by the newspapers and the public of Baltimore to the record made by the United Railways & Electric Company during the recent severe snow storm in that city. The editorials were unstinted in their praise of the work of the company. Quite properly their appearance must have been most gratifying to the management. Regarded legally, this intangible, evanescent thing, good will, is premised upon the existence of competition, so it is considered not to exist as value in public service cases. It has no place in the rate base, but it is a big thing, an important thing. Judge Hough was correct technically when in passing upon the Consolidated Gas case in New York, he said that the company was required by law to furnish gas to all demanding it within certain distances of the mains. But there is another side to the picture.

Merely to run cars, merely to furnish gas, merely to sell electricity, is not enough. Long before the electric railways were confronted with the present competitive era, many of them recognized this. The companies have invariably done best which have kept up their properties and done the thousand and one other little things that make for satisfactory service. Instance upon instance could be cited, but it is only necessary to refer to the records of the roads that have won the Coffin Award and of other competitors in this contest.

Ingratitude is a very human trait, but it seldom is the reward of the man who does his very best and convinces others that he is doing all that may be expected with the talents that have been delivered into his hands. And the holder of the talent is not the judge and jury in passing upon his own acts. The court by which his acts are judged is the court of public opinion. It is not a perfect court, to be sure, but its verdict is usually just. No business, not even a non-competitive business, is a law unto itself. Legally, the matter of good will may not be taken into account in non-competitive business, but good will is nevertheless the factor that very often spells success or failure for a property.

Real Maintenance Anticipates Repairs

PAINSTAKING thoroughness is the price that must be paid if success is to be attained in any continuing enterprise. Nowhere is this more true than in the work of keeping a property in condition for providing the class of service that is demanded by the public today. It is not enough to make repairs after a failure has occurred in service. The incipient failure must be discovered and the cause removed if the public is to be impressed with reliability and excellence in the company and its organization.

In this connection, attention has been directed in the past few years to the outstanding record made by the maintenance forces in New Orleans, where failures of service are so rare that they are a matter of comment. The way this has been accomplished was told at the recent meeting of the Electric Railway Association of Equipment Men, Southern Properties, by Gus C. Kraus. His paper, which is abstracted in this issue, carries no hint of a magical method. Rather, the excellence of the performance is the story of consistent, intelligent, hard work.

The practices followed in New Orleans, while they are of the best, are known to every master mechanic the country over. The secret, if there be any, lies in the inspection and overhauling of the equipment before it is due to fail from ordinary wear and tear. This requires a definite program which is developed after long experience and is definitely held to. No easier road to good service exists.

The Changing Status of the Employee

APPROXIMATELY 2,000 men and women, veteran workers of the Westinghouse Electric & Manufacturing Company, attended the fifteenth annual banquet of the company's veteran employees' association a few days ago. This occasion was not only the largest affair ever held by the organization, but the largest banquet ever held in Pittsburgh. More than that, it served to focus attention on the changing status of the employee where proper direction is given to his activities with the recognition of the responsibility of the employer under the economic conditions that exist today.

The procedure followed by the Westinghouse Company in its dealings with employees is only one of many that might be cited. Other electrical manufacturers, notably the General Electric Company, have followed a similar progressive procedure. In the public utility field, participation by company managements on behalf of their employees extends in addition to pensions, to insurance, profit-sharing, building and loan activities, industrial loans, preventive medicine, doctoring, nursing, supervisory efforts and the planning and management of budgets.

While the theory still persists in some quarters that employers have no economic responsibility to old workers, it is much less pronounced than it was, even in business regarded as highly competitive. The idea of progressive managements now is to use men intelligently, particularly older men, by training them for work which they can do when they no longer are able to perform the exacting tasks which were theirs during their younger years. In this work especially have the utilities been in the forefront.

The case for the future was put succinctly by Secretary of Labor Davis at the Westinghouse Company banquet when he said that science has added years to the span of human life. Instead of becoming a liability at 50 or 60, the intelligent worker is all the more an asset to the concern that employs him. The veteran employee is always worthy of his hire—some hire. If that were not true, he never would have become a veteran in that particular service. Much still remains to be done in the realm of bettering employee relations, but in the progress so far made the great electrical manufacturing companies and the rank and file of the public utilities have played their part and played it well.

James H. McGraw Wins Bok Award

Publisher of Electric Railway Journal Gets 1927 Medal for Distinguished Personal Service Rendered American Commerce and Industry Through Raising the Standards of Advertising

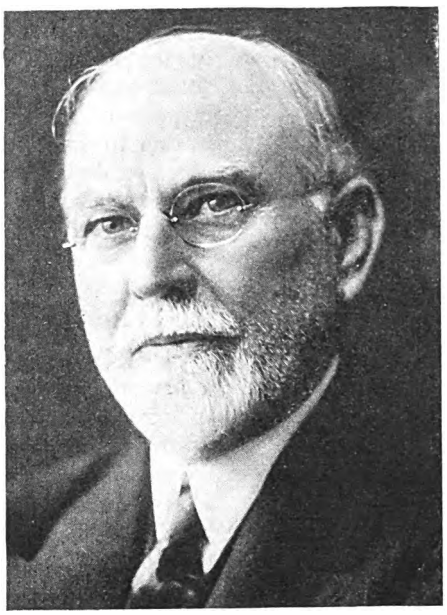
JAMES H. McGRAW, president of the McGraw-Hill Publishing Company, Inc., chairman of the McGraw-Shaw Company and chairman of the McGraw-Hill Book Company, was presented the Harvard Advertising Award for Distinguished Services to Advertising (in 1927), highest of ten awards established by Edward Bok, at a dinner held on Friday night, Feb. 17, under auspices of the Graduate School of Business Administration of Harvard University. The award takes the form of a gold medal given to the "individual or organization deemed by the jury of award to merit recognition for contemporary services to advertising." The medal bears the inscription: "To James H. McGraw—For distinguished personal service rendered American commerce and industry through raising the standards of advertising—1927."

The Bok Awards are administered by the Graduate School of Business Administration of Harvard University. They are offered in the conviction that advertising, wisely utilized, is a great economic power to broaden markets and decrease the cost of distributing goods; but, if unscientifically employed, is wasteful to the community. The prizes are given for the best work in advertising within the terms of the several awards in accordance with the decisions of a jury of award appointed by the dean of the Harvard Business School.

The following quotations from the Harvard University announcement of the award indicate the reasons for bestowal of the medal upon Mr. McGraw.

1. James H. McGraw, president of the McGraw-Hill Publishing Company, Inc., was awarded the Gold Medal for Distinguished Contemporary Service to Advertising because of his life-long service in the upbuilding of higher standards in advertising in the business press of the country.

2. In making the award of the gold medal, which is the greatest honor in the series of Harvard Advertising Awards, Professor Sprague spoke of Mr. McGraw's pioneering work in the recognition of advertising's relation to marketing, and of his constructive services in the upbuilding of the highest advertising practices among the organized business press.



James H. McGraw

Professor O. M. W. Sprague is acting dean of the Graduate School of Business Administration of Harvard University. He presented the awards in the absence in Europe of Dean Wallace B. Donham.

In the field of business publishing, Mr. McGraw has been a leader in securing adoption of the code of ethics and business practice which today governs the editorial, advertising, and business activities of the organized business press. He has been a pioneer in the recognition of the relation of advertising to marketing. Studies of industry's buying habits and the effective form of marketing organization for industrial products have done much to clarify industry's appreciation of the particular requirements of industrial marketing, as contrasted with the development of sales to the private consumer. Mr. McGraw's constructive service to the upbuilding of American industry has long been recognized and was formally acknowledged publicly at a dinner of industrial leaders, held in New York a year ago. The committee which arranged for that dinner included Secretary Herbert Hoover; Thomas A. Edison; Owen D. Young; the late Guy E. Tripp; Simon Guggenheim; John Hays Hammond; General William Barclay Parsons and Gerard Swope.

Mr. McGraw is president of the largest business publishing organization in the world, issuing fourteen engineering and industrial publications, twelve in New York, one in San Francisco, and one in London. The weekly and monthly journals over which he exercises executive control penetrate to every civilized country. They cover the fields of civil engineering and heavy engineering construction; the electrical, radio, electric railway and bus industries; the machine-using industries; the generation and application of power; the chemical industries, coal mining, and nonferrous metal mining. McGraw-Shaw publications serve industrial management and plant engineering through the broad sweep of industry as a whole.

In the electric railway and the electrical industries, Mr. McGraw has pioneered in development from the early days. His publications have been responsible for the adoption of co-operative movements in many industries. They have insisted upon the elimination of unethical practices, wasteful of the public good.

Mr. McGraw was born in Panama, Chautauqua County, New York, on Dec. 17, 1860. He came into publishing from the principalship of an upstate school. He is a member of many engineering, business and scientific organizations. Among these are the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, National Electric Light Association, American Electric Railway Association, the Illuminating Engineering Society, Harvard Business Historical Society. He is the third person to be honored with the medal for distinguished services to advertising. The two men previously honored are Ernest Elmo Calkins, president of Calkins & Holden, and O. C. Harn, managing director of the Audit Bureau of Circulation.

Advertising

And the Maintenance of Prosperity

By James H. McGraw

President The McGraw-Hill Publishing Company, Inc.

"The Part Which Advertising Plays in American Business Progress" was the subject of an address prepared by Mr. McGraw for delivery at a dinner held at the Faculty Club in Boston on Feb. 17, upon the occasion of the presentation to him of the 1927 Bok Award for distinguished service to advertising. His remarks dramatize the power and limitations of this modern business tool and voice the high ideals that must guide those who direct and use it

ADVERTISING has come to occupy an important position in the consciousness of the public and of business. Its potentiality—for good or for ill—in the distribution of both industrial and consumer goods, is recognized as tremendous. An abiding sense of responsibility to the public must be employed in directing this force. Assurance that advertising men recognize this responsibility is afforded by such organizations as The International Advertising Association and the Better Business Bureau. But a still more dramatic assurance has been called for, and this Mr. Bok has created in the Harvard Advertising Awards.

When, four years ago, these awards were announced, it was particularly gratifying to me that Mr. Bok, an outstanding editor and exponent of highest publishing standards, should have so clearly sensed the social responsibility involved in the creation, use and sale of advertising. At each stage of the business situation, advertising takes on new significance and new obligations. More and more, advertising becomes essential to the economical movement of goods, from industry to industry, from producer or merchant to consumer. More and more does advertising guide preference for commodities and services that, interwoven, form the very warp and woof of our civilization.

Advertising as a Business Force

At present the volume of trade is large. But competition is throttling; and profits, in some quarters, are declining. Some industries are despairing of customers. Has advertising, now so generally used, proved ineffective in maintaining full prosperity? Or have we as yet failed fully to appropriate the power of this great force? Lowered profits and idle capacity are not the concern of the stockholder alone. The public as a whole—employing and employed, as well as investor—suffers a set-back when profits are squeezed and wares go a-begging.

Primarily the function of advertising as a business force is to interpret or expand a personality, whether of a product or of a service or of an industry. Products and services vary greatly in personality or distinctiveness, and it has long been recognized that a distinctive product has a decided advantage and security in the market. Excessive competition, with the squeezing out of normal profits, results from a surplus of identical or alternate products, or a surplus of products believed to be alternate.

In considering the broader use of advertising as well as its more effective application, it may be questioned whether any product, however staple it may appear at first sight, is without elements of distinction. A product is endowed with the qualities of its makers, and no organization is entirely devoid of personality. The very fact of survival in a competitive market is proof that there is distinctiveness in product or service. There are such individual factors as company reliability; assurance of progressive product improvement through intelligent engineering or painstaking research; ability to assist buyers by prompt deliveries; competence of representatives to advise on use and application of the product and on the condition of the market. There are a hundred respects in which firms differ from each other. All these affect the willingness of the buyer to take one manufacturer's product rather than another's, even though the products appear to be similar.

Advertising Puts the Battle on the Seller's Ground

The very planning of advertising results in a most searching examination of products since the distinctive elements must be determined. If, perchance, there be no market distinction, then, at the very least, advertising may guarantee a continuance of quality. The market position of certain brands of flour, bread, soap, cement, brass, industrial belting—the prosperity attending their makers—is eloquent testimony of advertising's effectiveness in the staple field.

True, advertising does not confer full immunity from price considerations and consequent narrow profits and halting markets, but it does shift the competition to bases of quality and use. It puts the battle on the seller's rather than the buyer's ground, but at the same time it proves a boon to the buyer because of insistence on quality. "Quality is remembered long after price is forgotten" is a slogan already accepted as a principle by industrial consumers. It suggests distinct social advantages to consumers at large.

Advertising cannot create qualities. Advertising cannot give market standing to a product where market value does not exist. It is sheer folly to assume that a product will take on compelling qualities if only they be claimed in advertising. Advertising can express, develop and amplify what is already present. It can stimulate the seed of product or service personality to growth and vigor. It cannot create the seed.

How often, through widespread advertising, do we learn that some worthy product, unknown because unheralded, is now to step out and claim its rightful place in the market. Advertising, presumably, is to supply the vitality, lacking for long slumbering years; advertising,

Digitized by Google

presumably, is to create overnight the effective producing organization that the years should have been developing; advertising, presumably, is to create marketing courage where timidity has calmly reigned. Invariably the effort fails. The newcomer, flashing meteor-like across the sky, fades quickly and leaves but black night. And often, all unjustly, the finger of accusation is pointed at advertising's failure.

Advertising is a challenge to soundness. It drags an institution into the limelight. It exposes it to examination and to criticism of its claims. Its defects are sure to be exposed. For businesses with productions that match the needs of the times, advertising is a beneficent instrument; for those with products that have no rightful claim to a market with the public, advertising is either corrective or it is fatal.

ADVERTISING cannot create qualities. Advertising cannot give market standing to a product where market value does not exist. It is sheer folly to assume that a product will take on compelling qualities if only they be claimed in advertising. Advertising can express, develop and amplify what is already present. It can stimulate the seed of product or service personality to growth and vigor. It cannot create the seed.

If advertising is to be an effective instrument of prosperity, soundness of marketing methods must be added to soundness of product or service. Distribution costs are being subpoenaed to appear before the court of public opinion. Too often advertising has had to bear the unjust odium of marketing's shortcomings. The logical markets may have been wrongly appraised. Distribution was attempted under conditions that made the cost prohibitive. Difference in buying habits, according to fields or industries, has been overlooked. Appeals to buyers have not been valid. Distribution channels have not been effectively organized. The sales force has been inadequate, ineffective or mishandled.

It is to their credit that many advertising men have been among the leaders in the adoption of modern marketing methods and that, in large number, they are competent counselors on marketing plans. We have a grave responsibility towards those to whom we offer advertising counsel. Effective advertising must be reared on two sturdy foundations; the first, a product or service which meets existent or unexpressed needs of the market; the second, a waste-free marketing plan for reaching responsible buyers.

A PRODUCT is endowed with the qualities of its makers, and no organization is entirely devoid of personality. The very fact of survival in a competitive market is proof that there is distinctiveness in product or service. There are such individual factors as company reliability; assurance of progressive product improvement through intelligent engineering or painstaking research; ability to assist buyers by prompt deliveries; competence of representatives to advise on use and application of the product and on the condition of the market.

In adapting advertising to its destined sphere of usefulness, we of the business press have endeavored to do our share. The consumer medium creates consumer demand and directs the consumer to the dealer. Our function is to move goods from industry to industry, and from maker to distributor. To no small degree, industry's profits are measured by economies in those many inter-industry and inter-merchant movements which lie back of the final sale.

The very essence of the business press is an intimate relationship with and understanding of the industry or trade served. The significance of its editorial counsel finds reflection in the use of its advertising pages. Over inter-industry transactions, the industrial paper throws an effective net, tapping in for every industry on its supply channels, and affording the supplier a direct contact with his market. The buyer uses the industrial paper as a tool of operation, making it the channel through which he selects the materials and equipment for the efficient manufacture of his product.

It is evident, therefore, that the industrial division of the business press has an important beneficial effect on the profit margin. Its reading pages are a text book of economy in manufacture; its advertising pages, a textbook of equipment for doing jobs at lower cost. Through the reading and the advertising pages, then, it conduces to the lowering of producers' costs on consumers' products. Thus it tends to widen the profit margin. At the same time, through stimulating economies in production, it gives the public continually greater values.

In its trade division, the business press is friend and counselor of distributor and dealer. It is a powerful instrument in developing producer-distribution relationships that smooth the flow of goods to the public. It transmits evidences of sustained demand, introduces new products quickly, demonstrates the power of quality. Through the trade paper is established a community of interest among manufacturer, distributor and dealer. They become co-operating elements by which consumer wants are filled with desired merchandise of known quality, with prices reflecting speedy turnover.

The award of this medal, this high honor, to a business paper publisher indicates to me that the advertising world is aware of the importance of the business paper in serving industry, trade and the public.

Advertising, proved an effective instrument in marketing specialties, is now entering the even larger arena where staples are battling before a price-obsessed public. It offers new weapons of quality and service in the struggle of business with meager profits. In this, advertising works for the public as well as for the advertiser. It helps to stabilize industry, and thus employment and dividends. It emphasizes quality and use, which, with price, are sounder criteria of value than price alone. It assures, through price stabilization, the continued improvement of and the development of products.

For myself and my colleagues in business paper advertising, I pledge you our best endeavors in a continuance of study, research and experiment, to correct misapplication of advertising, to make it a still more effective tool of business, and an agent in advancing the public welfare.

Jigs and Dies Have Many Uses

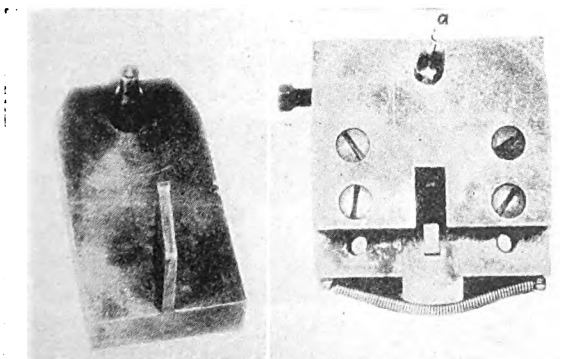
in Shops of Chicago Surface Lines

Small parts of various kinds are either partly or entirely made by punching processes in Chicago. Some of the work is automatic or semi-automatic and requires no finishing

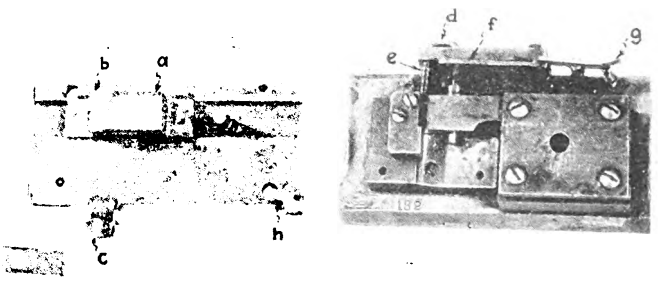
PRODUCTION of maintenance parts and special parts for various purposes about the Chicago Surface Lines is facilitated through the use of various jigs and dies. These insure uniformity and also accurate workmanship and hence save much time and trouble which would be necessary without them. A large number of these fixtures were described in an article in ELECTRIC RAILWAY JOURNAL for Dec. 20, 1924, page 1023. Some additional ones are given in the brief submitted for the 1927 Coffin Award. These are described below.

A form of die used for punching holes in small structural members which have been laid out with a center punch is arranged to locate the holes from the punch marks. When set up in the machine the end of the pointer marked *a* in the accompanying illustration corresponds exactly with the center line of the punch. When the work is moved so that the end of the pointer coincides with the center punch mark the hole to be made is located and the punch itself will descend in proper position. A wedge carried on an extension back of the punch enters the slot as the punch descends and forces the slide back so as to move the pointer out of the way while the hole is being made.

The distinctive feature of a semi-automatic punch and die used for forming contact fingers is its automatic ejector. Material of the proper size is fed continuously into the machine and the press is operated at top speed. As the punch descends the finger marked *c* in the accompanying illustration enters the opening *d* and forces the U-shaped ejector out of the way of the forming punch *b*.



Die which locates holes from center punch marks. The pointer is designated as "a" in the accompanying illustration



Semi-automatic punch and die for forming controller fingers. A feature is the automatic ejector

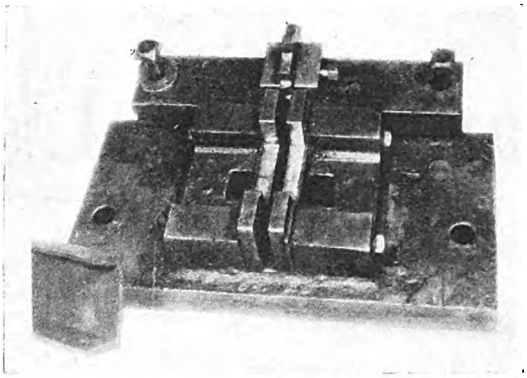
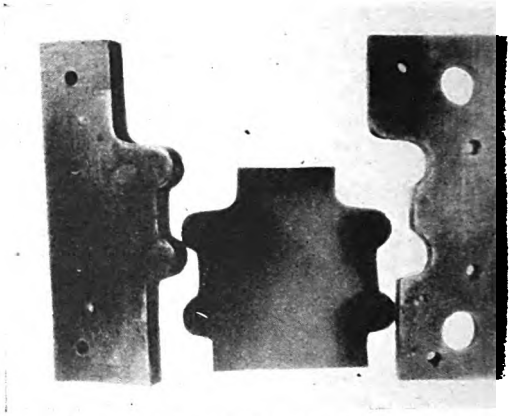
Multiple punch and die for punching large holes in channels

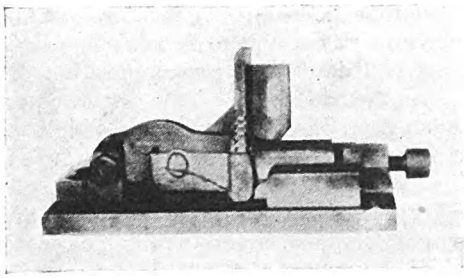
Punch die for making countersunk slotted holes in structural channel wear plates



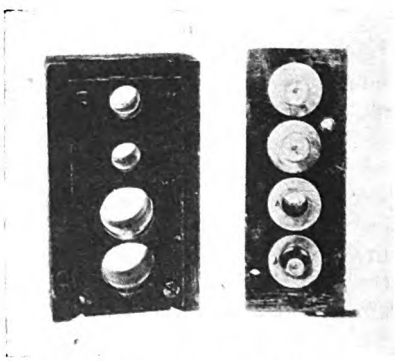
Punch and die for cutting off channel iron used in making truck pedestal wear plates



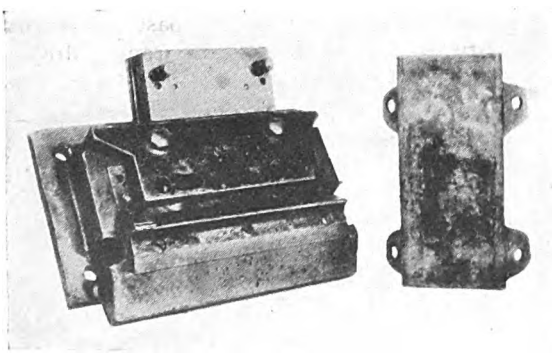
Heavy cutting die for blanking out irregular shaped wearing plates



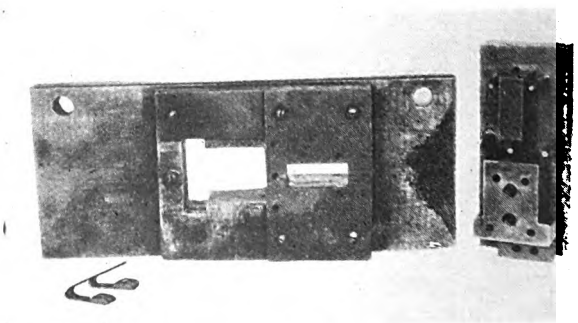
Fixture used for broaching brush-holders



Double die for punching trolley wheel washers



Jig for punching holes in wear plates



This punch and die is used in the production of contact springs as shown in the lower left-hand corner

Digitized by Google

The ejecting spring *e* is compressed and the latch *f* drops into a notch, thus holding the ejector back in position. While this action is taking place the hook *h* slips below the secondary latch *g*. The piece in the meantime has been punched, formed and cut off and is lying in the bottom of the die. As the punch ascends the hook *h* trips in turn the secondary latch *g* and the latch *f*, releasing the ejector *d*, which under the action of the spring *e* snaps the completed piece out of the bottom of the die.

An excellent example of a die which substitutes punching for what would ordinarily be a drill press job is the one employed to make large holes in the channels that are used as wear plates on truck pedestals. In the illustration showing this multiple punch and die the block in the die supports the web of the channel so that it can be punched without distorting the flanges.

Another simple punch and die are used to make countersunk slotted holes in 4-in. structural channel wear plates for truck pedestals. These particular wear plates are held in place with countersunk head bolts with a lug at one side to prevent them from turning. As will be seen from the illustration the punch not only cuts and countersinks the hole but also forms the notch to take the projecting lug on the bolt.

Another illustration shows a heavy cutting die for blanking out the irregular-shaped box wearing plates. It is necessary to make two cuts to complete the work, the piece being turned around after the cut on one side has been made. For cutting off the channel iron used in making truck pedestal wear plates a special punch and die are used. The die acts as a support for the web and the flange of the channel, thereby preventing distortion of the member which is cut. For punching the holes in the ears after the pieces are formed a special jig is used. This is of interest chiefly because of the complicated shape of the piece to be punched. It will be seen from the illustration that several sets of holes in the jig permit it to be used for punching wear plates for different sizes of journal boxes.

A simple jig for holding brush-holders while the brush slide is being broached is shown in another illustration. The movable block, actuated by the hand screw, holds the brush-holder against the block. This block is pinned at one end, so that it can be raised out of the way, permitting insertion and removal of the brush-holder. The broach is shown in a position ready to be pushed through by a press.

Trolley wheel washers are made efficiently by a double die. The material from which the washers are punched is purchased in rolls, two thicknesses of which are fed to the die at one time. The ribbon is fed through at such a rate that four washers are formed at each stroke of the punch. In the illustration the punches for the holes are shown at the top and those for blanking out the washers are at the bottom.

Another interesting punch and die shown are used to form a special type of contact spring. Five small punches produce the holes which support the spring and fasten on the contact tips. A large punch cuts the material out to the desired shape. Punching and forming are done at one stroke of the press, so that a complete spring is blanked out each time, the spring being given its final form by another punch and die in a following operation.

Display card clips are made in a special die. One part, shown at the left of the illustration, produces the large half of the clip, a complete unit being punched, shaped and cut off at each stroke of the punch. Another punch and die, shown at the center, bend the piece to its final right-angle shape. The punch and die used to produce the other half of the clip are shown at the right. In both cases the material, furnished in the form of a ribbon, is fed to the die by hand, a stop allowing the proper amount to enter at each stroke of the press.

A simple jig facilitates the boring of rebabbitted air compressor connecting rods. The holding down strip is pinned at one end so that it can be swung out of the way, allowing the connecting rod to be placed in its proper position. The wristpin end of the connecting rod fits snugly over the plug and is held in place by a taper key. The wristpin end is supported by a plate and the crankpin end by pins. Side adjusting screws enable the operator to center the bore of the crankpin end with respect to the boring bar pilot hole in the base of the jig.

For milling engineer's valve stems a clamp combined with an ordinary indexing head is used. The clamping device consists of a split bushing which is tightened by a lever actuating a cam. Engineer's valve handles used on the system have special provision to compensate for wear of the stem and handle. The two main parts of the handle are hinged together at the stem end. The inner end of the smaller part is connected to the larger part by means of a screw and knurled adjusting nut. Tightening of this nut eliminates the backlash and the handle cannot be accidentally pulled off from the stem. As there is no movement between the handle and the stem in service there is no wear, and a saving in the bushing of handles results.

Berlin, N. H., Does Extensive Track Rehabilitation

5-in., 80-lb. T-rail laid on creosoted ties used with paving of concrete. Cost was paid from earnings

By Harry W. Noyes
Manager Berlin Street Railway, Berlin, N. H.

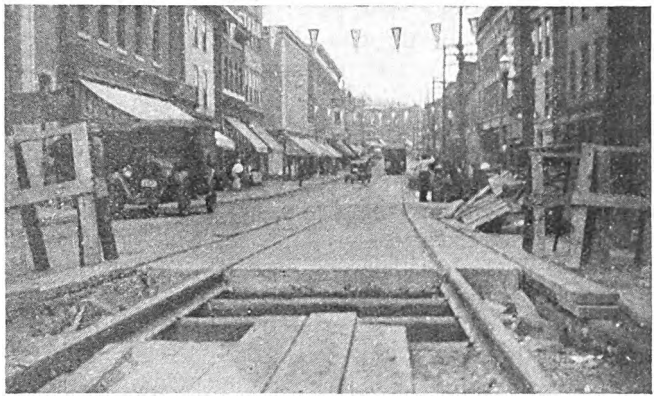
During the months of July and August, 1927, the Berlin Street Railway reconstructed 3,000 ft. of paved track in the city of Berlin, N. H. Although in these days of the automobile some railways are taking up their tracks and substituting buses, this company is taking up old rails and installing heavier rails, double bonded, with treated ties completely imbedded in concrete. Every dollar spent on this new construction was taken from money earned in the past seven years. It is interesting to note that this street railway has been able to pay dividends on all of its stock for the past six years.

In 1923, 1924 and 1925 this railway laid 1,750 ft. of new track with concrete paving and the past year's work has been a continuation of the same program. Most of the track to be replaced was installed in 1902, with 4-in., 60-lb. rail. The base and filler in some places were of sawdust and slabs, covered with about 4 ft. of stones and gravel. In the course of time this paved section gradually sank and became extremely costly to maintain.

Excavation work was done by two compressors operating four paving breakers. The crew consisted of two foremen and 40 men. Solid concrete had to be taken out in some places to a depth of 11 in., or 3 in. below the bottom of the city's 8-in. paving slab.

Special care was used to make the paving waterproof, particularly along the rail. After the excavation of every 200 ft. the trackmen laid and resurfaced the new track.

Digitized by Google



Track at Berlin, N. H., rebuilt with 5-in., 80-lb. T-rail and concrete paving

Standard A.S.C.E. 80-lb., 5-in. Carnegie open hearth T-rail, in 33-ft. lengths, with six-hole angle bars, was used. Spacing of drill holes was 2½ in., 5 in. and 6 in. Track bolts ⅞x4⅜ in. were used with U. S. Standard square nuts and ⅞x$\frac{5}{16}$x¼-in. heavy positive type D lock washers.

Rails are supported on creosoted Southern yellow pine and kyanized Northern spruce ties. In a railway the most important ties are under the joints, switches and frogs. At these points we used at these places only kyanized Northern spruce ties, manufactured by the Brown Company of Berlin, N. H. At other places we used the creosoted ties. These ties were laid with 30-in. centers, while the joint ties were spaced with 24-in. centers. The ties were laid on 2 to 4 in. of sand and gravel.

The rails were double bonded at each joint, using O-B rail bonds, type AW-8, 7 in. long and of No. 00 size. These were welded on the ball of the rail. On the base of the rail, at each joint, we also used the O-B rail bond, type AW-7, 44 in. long. At about every 500 ft. we used cross bonds, made of old trolley wire.

Carey expansion joints were used, with dimensions of ¼x9x7 in. After pouring a 1:2:4 mixture of concrete, it was allowed to cure for seven days. Great care was taken to tamp the wet mixture of cement, sand and stone thoroughly under the rails. The city then laid kyrock, a bituminous form of oily concrete from the edge of the cement to the curb of the sidewalk. When thoroughly compressed and properly laid this becomes hard and makes a good street surface.

At two places in this reconstruction bridges were encountered. Water formerly ran under these bridges and afterward they were filled in with various materials. Considerable sinking had occurred. At these locations a layer of concrete 8 in. deep was laid. On this old rails were placed covering an area of 8 ft. wide and 40 ft. long. Then the rails were covered with concrete. The ties were placed on this surface and covered with the regular paving, 11 in. between and 5 in. over the ties.

Special work had to be installed on one turnout. This consisted of two switch mates and two frogs. The two rigid mates were of manganese steel, iron bound, of 7-in. construction and having a tread clearance of 3 in. The two frogs were of hard center and were iron bound.

Since the completion of this reconstruction the Berlin Street Railway has received many compliments from its patrons.

Increase in Assets of Milwaukee Loan Association

MORTGAGE loans amounting to $1,991,691 were made during 1927 by the Employees' Mutual Saving, Building and Loan Association, comprised of employees of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., according to the association's annual report. Assets on Dec. 31 are shown to be $9,154,556, an increase of 14 per cent. Outstanding loans number 3,077, an increase of 279 for the year.

New Bus Garage for Worcester

FIFTY buses can be accommodated in a garage recently completed by the Worcester Consolidated Street Railway, Worcester, Mass. The cost was about $120,000. The large floor space is free from obstruction and the roof is of the truss type. A large skylight provides daylight illumination. The garage is equipped with a large machine shop, repair pits and a battery-charging department.

A new carhouse has also been built at a cost of $235,000. It is of modern design, being modeled after the Hooker St. carhouse in Springfield, Mass. There is space for 40 cars inside the house, and an outside storage yard provides for 200 additional cars. The carhouse has facilities for inspection and washing. It also provides rest rooms for employees, lockers, offices and a restaurant. The garage and the carhouse are adjacent, both standing on the Grove St. property of the company, which previously was used largely for outdoor storage.

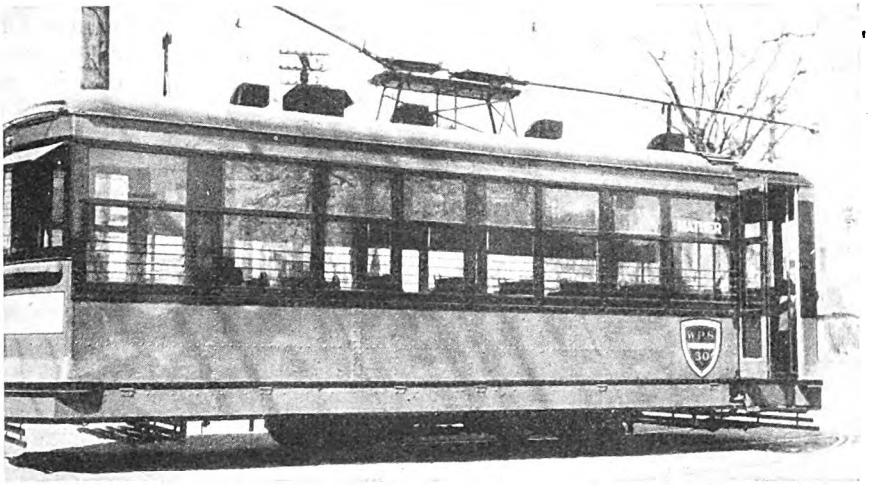
Making Old Cars Attractive

It is possible to do many things to improve the appearance of rolling stock so that it has greater rider appeal and earning power. Rubber insulation has reduced noise greatly

By Joseph E. Bodoh
Master Mechanic Wisconsin Public Service Corporation, Green Bay, Wis.



A gutter above the windows prevents rain from streaking the windows. Note the skirt which conceals the running gear and reduces noise

NOT only can new cars be designed so as to attract the eye of the riding public but to a considerable extent the existing rolling stock can be improved so that it also has an appeal. Along this line the Wisconsin Public Service Corporation at Green Bay made the Civic Safety Week held there recently the occasion of special significance with the first showing of a new idea in street car development. One of the regular Birney city cars was turned over to the master mechanic some time ago with permission to do just about anything that he cared to with it to improve its riding qualities, its appearance and safety features, at a minimum of expense, of course. The result, as first offered to the public during Safety Week, has received unstinted praise.

A careful study of the demands of the public and of the necessities of the present street car era brought forward three outstanding needs in new car development. It was felt that the people wanted a better-looking vehicle than they had in the past been accustomed to riding in, as their private conveyances were finished both inside and out with the best available materials and in attractive colors. Another factor, noise, has brought street cars into public disrepute during the past few years. The clatter and rumble of the older cars has lost both cus-

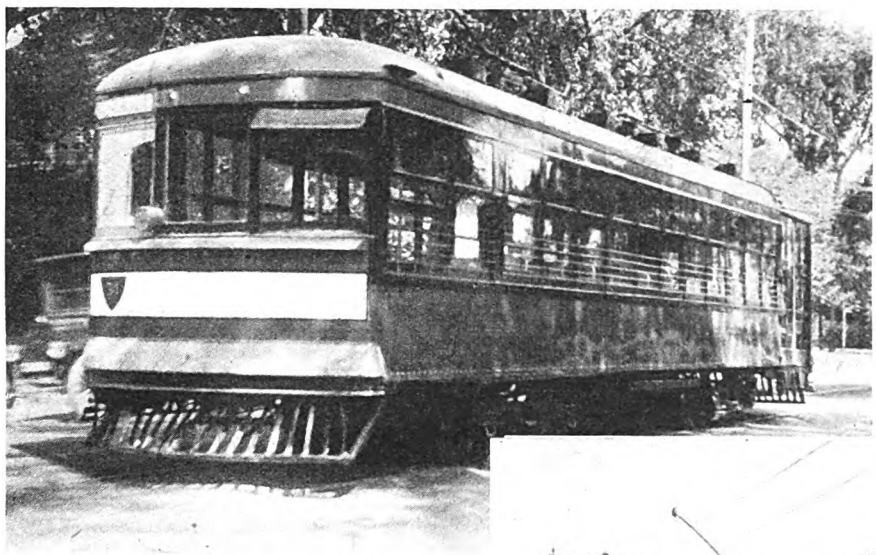
Digitized by Google

tomers for the railway and friends among those who do not habitually ride. A third factor, safety, is of special interest at the present time because of the national study of traffic problems.

Improvements were first determined on to make the car more attractive as a conveyance. A new color scheme was developed to take the place of the time-honored green and yellow that had been standard in Green Bay for many years. This necessitated a study of colors and of their effectiveness in traffic. A very recent French color in one of the new finishes was finally selected for the body of the car. This color borders between an olive and a rich tan and will not show mud or dust. The window sash and casings are of a deep orange, a color



One of the large cars has been decorated like the Birney car. Note the white band on the dasher, the floodlighting and the motorman's visor

with exceptionally high visibility. The car was then striped in black, with extreme lines, giving it the appearance of extra length. The front of the car has been decorated with a 10-in. white stripe, as shown in the illustrations, adding to the neat appearance and acting also as a safety precaution. The roof of the car is black.

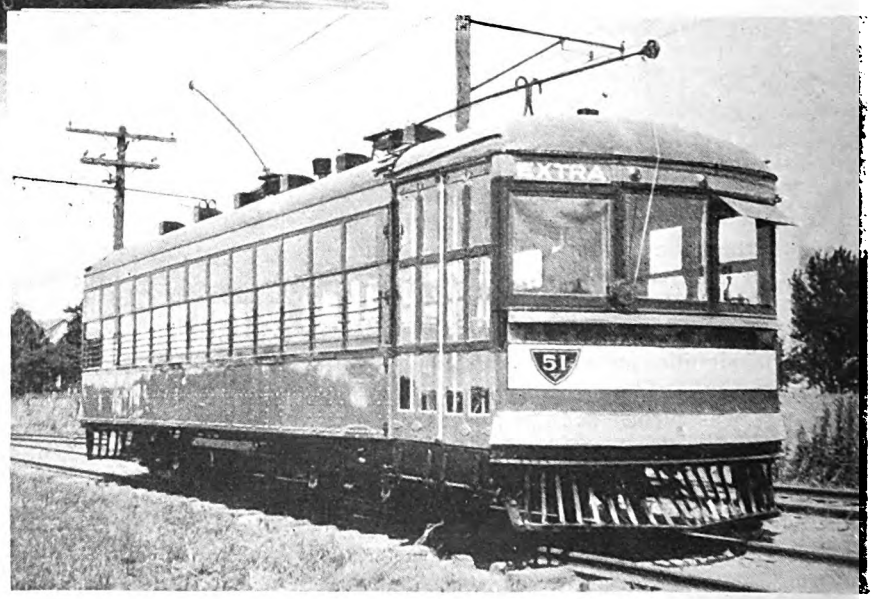
In order to eliminate somewhat the dirty appearance that a car has after it has been out in the rain for any length of time a gutter has been attached to the bottom of the letterboard just above the windows. Realizing that an ordinary gutter would not hold the water when the car was in motion, a good deal of time was spent in designing one that would not spill water except in unusually heavy rains.

The car has been numbered in an unusual manner with an adaptation of the Byllesby shield, the Wisconsin Public Service Corporation being a member of the Byllesby Engineering & Management Corporation system. This shield just to the left of each door carries the car number and the initials of the local company. A small shield on the front of the car also gives the number.

The interior of the car has been decorated in light tan enamel with a white enamel ceiling and a dark green floor with a tan section down the center, between the seats. The illumination in the car has been doubled, adding both to the appearance of the car interior and to the exterior when seen at night from the outside.

In order to promote traffic safety the strip of white mentioned before was placed on both ends of the car. At night this strip and the entire front of the car below the windows are illuminated by use of floodlights concealed below the window line by means of a shield. The contrast between the white section and the tan body of the car is pronounced and is a very definite warning to motorists of the car's presence. It defines the width of the car more effectively than if the front were of any one color, due to the contrast. Safkar steel steps replaced the former wooden steps, with an apparent gain in the safety of people boarding the car in wet or stormy weather.

Noise reduction came in for much consideration and the results furnish what is likely the greatest railway development as a result of this particular car. It is not yet possible to measure exactly the noise reduction that this car has achieved, but it is expected that accurate figures will be available before long. The rattle of the windows was entirely eliminated by the use of a small anti-rattling rubber roller developed for this purpose.



The attractive color scheme adopted for the Birney car was used on one of the larger cars also. The body color borders between an olive and a rich tan while the window sash and casings are a deep orange

The source of what seems to be 85 per cent of the street car noise, that rising from the trucks, wheels and gears, was next given consideration. The wheels and gears have been lined on both sides of the web with eight rubber blocks, bolted through holes in the web. Rubber, as the best known noise absorbent, has been used extensively, following the trend of the bus industry. These rubber blocks reduce the shrill noises of the gears and of the wheels when brakes are applied or when the car is rounding a curve. Large blocks of rubber have been bolted to the journal boxes, journal box covers and gear cases. Long strips have been bolted to the main truck members. The idea has been to absorb or deaden the

Digitized by Google

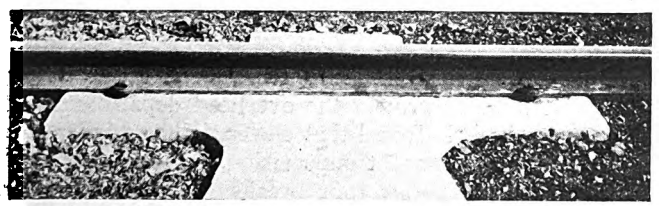
noises as they travel along the metal of the car frame. The side springs are carried on fiber washers and the gear cases are cushioned on rubber pads. In every other place where rubber or fiber could be used to separate metal from metal it has been used. This insulation has eliminated all frictional noises caused by truck members moving against each other.

The car marks an inexpensive attempt to provide more attractive transportation and seems to have accomplished its aim in large measure. Certainly it has evinced many favorable comments.

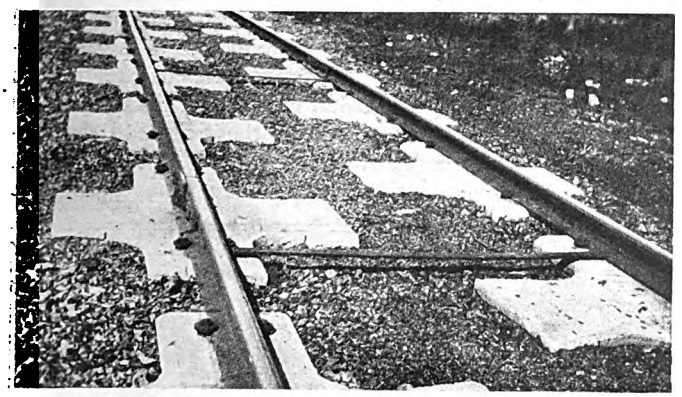
Harmony Line Tests Cruciform Rail Supports

SEVERAL forms of tieless track for interurban use have been tried in the last six years by the Pittsburgh, Harmony, Butler & New Castle Railway, under the supervision of Harry Etheridge, vice-president and general manager. A form has finally been developed which it is believed will meet the requirements of a permanent resilient track subject to the movement of cars weighing 90,000 lb. loaded, and traveling at 10 to 50 m.p.h.

The first stretch of tieless track, laid at Harmony Junction in 1921, was made up of plain concrete blocks composed of one part cement, two parts sand and four parts slag. The blocks were 16 in. wide, 30 in. long and 10 in. thick, with spaces of 10 in. between the supports to allow for jacking up the track. To obtain resiliency, and to avoid grinding away of the concrete by rail movement, each block was recessed for a piece of wood 5 in. wide, 20 in. long and 1 in. thick. The blocks projected ¼ in. above the face of the concrete.



Close-up view of inside leg of the rail support

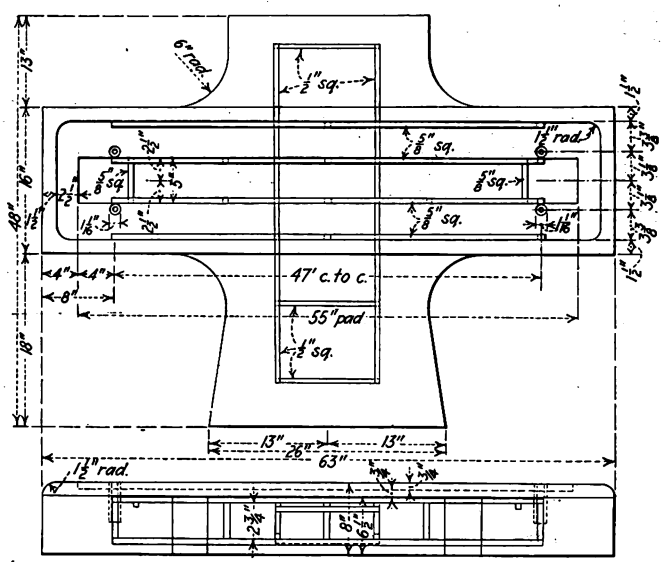


The supports are staggered with respect to the two rails. Tie rods spaced every 16½ ft. hold the rails to gage

A year's experience showed that the wood was not resilient enough to give the desired elastic support for the rails, so a pad of the general consistency of hard rubber tires was designed. This pad was 5 in. wide, 20 in. long and ½ in. thick and was made up of roofing-sheet material, laminated under pressure. Unfortunately, there was not enough bond between these laminations to prevent them from squeezing out with the weight of passing rolling stock. The manufacturer of Carey "Elastite" track filler supplied a material for trial, but this, too, proved too soft. Pads of scrap leather, made up in vertical laminations tied together with end plates and a pair of through bolts, were supplied by shoe manufacturers and given a trial. This combination, however, was too hard for use.

The Carey company produced another combination and this seems to be a permanent cushion for the rail blocks. This cushion is made up with a very flexible "Elastite" pad measuring 55x5x½ in., over which there is placed a harder "Elastite" composition ½ in. thick. This combination has shown extrusion in only five out of twenty blocks and in these cases it has not been serious. The ballast gives both elasticity and permanence and should prove superior to either rubber or leather.

Despite their lack of reinforcement, the original concrete row of blocks gave much better service than might have been expected. Most of them are still free of serious fractures. However, it was realized that for permanence reinforced concrete was essential and in building a ten-block, 60-ft. stretch at Zeigler in October, 1926, the concrete was reinforced with ½-in. square and ⅝-in. square rods, spaced as shown in the accompanying diagram. A mixture of one part cement, two parts sand and three parts slag was used in this construction. An inside stabilizing leg 22x24x7 in. was added to overcome any tendency toward rocking or teetering of the blocks. Since the car wheel pressure is greater near the gage line, rather than at the rail center, it was necessary to offset forces that would turn the block aslant.



Cruciform concrete rail support showing fish-tail form of stabilizing leg and location of reinforcing rods

This construction proved satisfactory, but observation suggested further improvements to keep all forces in equilibrium permanently. Accordingly, when a 25-block, 150-ft. stretch was put down in October, 1927, a counterweighting shoulder was added on the outer side of the rail. The inside stabilizing leg was also changed from a straight-sided to a fish-tail form to secure better anchorage in the center of the ballast. This is the design shown in the accompanying illustration. The cost of this type of construction is placed at about 25 per cent more than construction with untreated oak or chestnut ties which are good for a life of only eight years.

Analyzing Trolley Line Failures

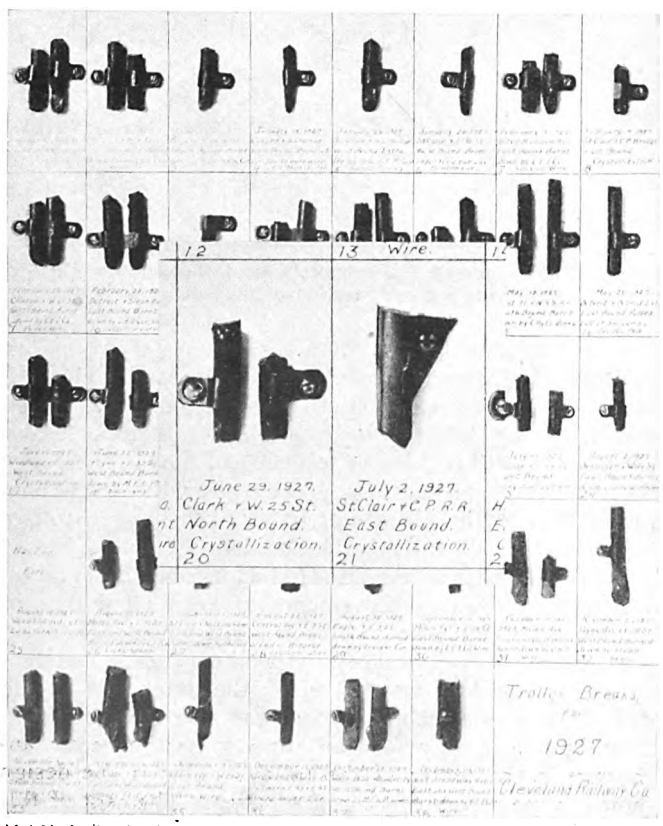
Systematic study of trolley wire breaks, with a visual record formed by the actual broken ends, has made possible a reduction in a year from 70 to 38 total breaks

By Angus G. Scott
Assistant Superintendent of Overhead Lines Cleveland Railway

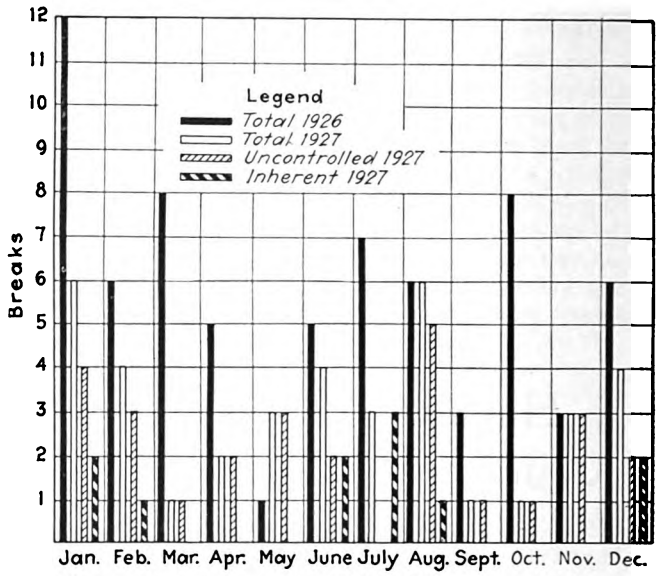
STUDY of trolley wire failures on the lines of the Cleveland Railway has been facilitated by clipping off and saving the ends of each wire break. The pieces, which are 1 to 2 in. long, are mounted on a board as shown in the accompanying picture and then are properly classified as to the cause of breakage. The ends where the failure occurred are always placed downward. Various public utilities the equipment of which was responsible for burndowns are designated by symbols. It is to be noted that the total breaks for the year 1927 numbered 38.

The saving of the ends serves several purposes. The vertical diameter of the wires at the various wire failures can be taken. This gives a check on the carrying out of work and causes for breaks. For instance, crystallization and the effect where it occurs on fittings can be shown to the linemen by a study of the actual wire ends. In this manner the correct classification of the cause of failure is made clear to them.

The samples are mounted on the employees' bulletin board together with the record of total failures and monthly totals of the breaks for the previous year. A visual demonstration is thus given to the men instead of an abstract statement of the number of wire failures and their causes. This has inspired a united effort to eliminate preventable breaks.



Actual broken ends of trolley wires are mounted on a board by the Cleveland Railway to study causes of failure. These represent all the breaks for 1927



Cleveland trolley wire breaks in 1927 compared with those of 1926

A graph of the breaks from all causes, which is self-explanatory, was prepared as shown. The causes are further analyzed in the table. It is interesting to note that trolley wire failures for 1927 show a marked decrease from those of the year 1926. The total fell from 70 breaks in 1926 to 38 in 1927. The total breaks from all causes is now on an average one for every 1,000,000 car-miles traveled, or 0.097 break per single-track mile. The suggested A.E.R.A. measure of efficiency lies between 0.450 and 0.5 break per single-track mile.

Separating the failures into two divisions—namely, those under the control of the overhead department and those beyond—it is found that eleven failures fall under the overhead department supervision, as compared with 33 in 1926. Of these, four breaks were due to worn wire and seven to crystallization. Breaks due to worn wire were 8 per cent less than in 1926. The failures due to crystallization were all of such a nature that it would have been impossible to detect the weakness before occurrence of the failure. No wire that failed due to this cause measured less than 0.300 in. vertical diameter.

Failures beyond the control of the overhead department were 27, as compared with 37 in 1926. The highest single factor in producing trolley wire failures for the

year was that of burndowns by foreign lines. These totaled thirteen, which was 34 per cent of the entire number of breaks on our lines.

Upon analysis of the various seasonal peaks it was found that they follow certain trends year after year. A high peak is reached in the summer months due to burndowns, and another comes in December and January.

A matter of interest is that between June 29 and July 17, 1927, four of the seven crystallization breaks occurred. This has been attributed to several causes, such as the weather and expansion of the wire. None of these reasons satisfactorily explains the phenomena.

The board for 1928 has been prepared with only 30 spaces for breaks. Unless unforeseen contingencies arise, such as sleet or wind storms, we expect to stay within this limit. Nevertheless there is plenty of room on the back.

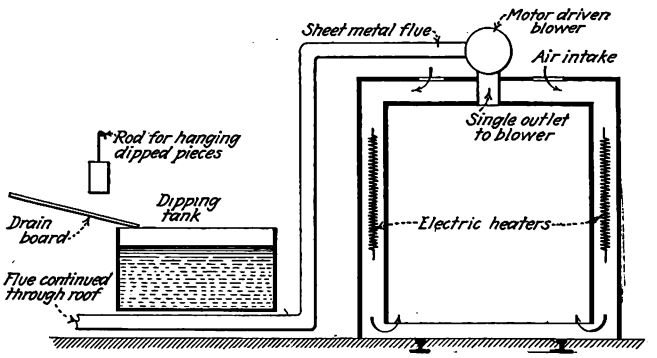
Baking Enamel Used for Many Parts in Twin Cities

ENAMELING of many parts used on electric railway cars, such as window guards, car steps, stanchions, fare boxes and the like, is standard practice of the Twin City Rapid Transit Company. Baking enamels are used, and in almost every instance the parts are dipped, so that all brush work is eliminated. This results in a considerable saving of labor, according to Joseph Gabler, foreman of the paint shop.

As the air temperatures in St. Paul, Minn., in which city the shop is located, are very low in winter some difficulty was experienced with the dipping process, as the enamel would become so stiff that it failed to drain satisfactorily. Accordingly a combination of dipping tank and oven was devised that provided sufficient heat to make the dipping process satisfactory.

The baking oven is 9 ft. wide by 12 ft. long and 7 ft. high. It was made by the Despatch Manufacturing Company of Minneapolis. It is similar to armature baking ovens except that it is somewhat larger. The walls are of heat-insulating material and are double. Air is admitted between the outer and the inner walls, as shown in the line drawing. It passes downward through resistance heaters, controlled by a thermostat, and enters the interior of the oven at the bottom. After passing over the pieces being baked the heated air is exhausted through a motor-driven blower on top of the oven. From here it passes through a rectangular sheet-metal flue, downward and beneath the dipping tank, which is placed close to the oven. After circulating beneath the tank the exhaust air is carried in a flue upward through the roof, so that the fumes from the evaporated solvents are kept out of the shop. This was found particularly necessary in the wintertime, since heating the shop is difficult at best.

Small pieces, such as fare boxes, are suspended from S hooks and dipped by hand. They are then hung to drain on a rod above a drainboard, so that the surplus enamel runs back into the dipping tank. Larger pieces, such as the rear step assembly shown in the illustration, are hung on a hand crane. They may be lowered into the tank, lifted for drainage and then swung out of the way while thus suspended.

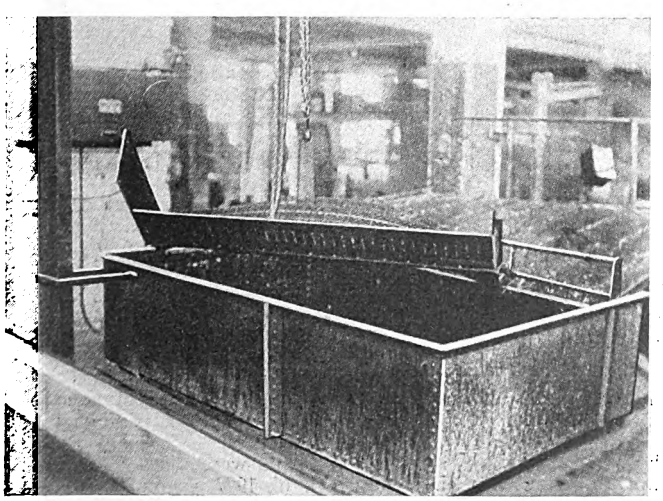


Section of dipping tank and baking oven, showing method of warming tank with waste heat from the oven

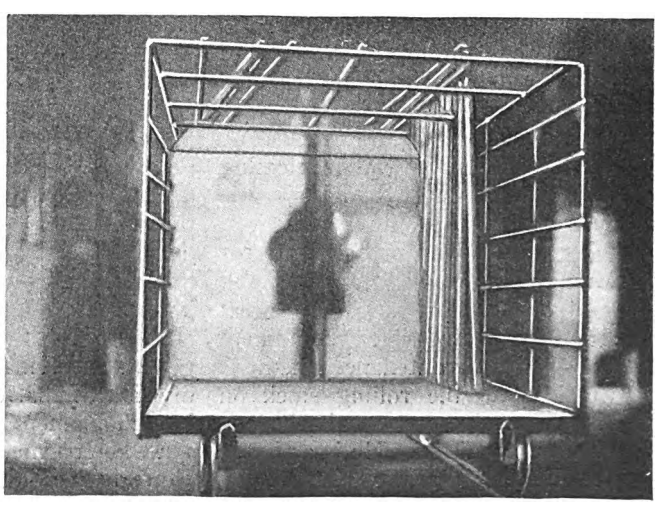
After dipping and draining, all of the parts to be baked are placed on a truck which caries a framework for suspending the small pieces and supporting the large ones. This is shown in another illustration. When the truck is filled it is run through the opened doors of the oven, the doors are closed and the baking takes place.

Enameling is done in a variety of colors, as desired. The blacks are baked at a temperature of 450 to 500 deg F. for about one hour. Lighter colors cannot stand such a high temperature, being baked at 250 to 300 deg. F. for 2½ hours. The parts are then completely dry and ready for use.

The enameling has been found a very satisfactory method of finishing miscellaneous parts. It is durable and readily cleaned. When pieces are dipped in any considerable quantity, as they are in this shop, there is a distinct economy over other finishes ordinarily used.



One of the dipping tanks. An entire rear step assembly is suspended over the tank for draining



All pieces are placed on this truck for baking, which takes place in the oven at the rear

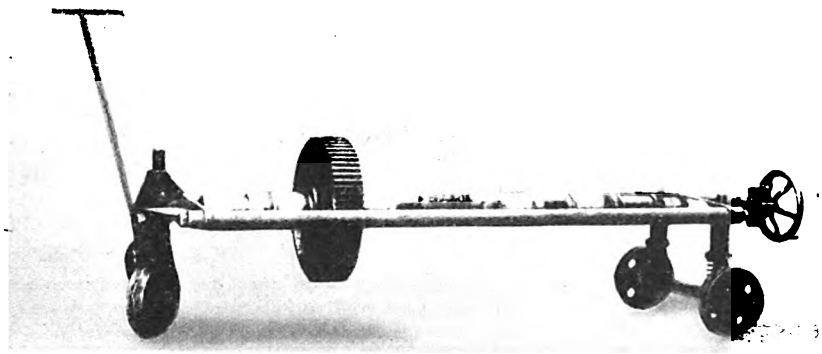
Second Monthly Prize Won by A. Taurman

A truck with centers for testing axles that may be bent also used in the straightening process was awarded the $25 monthly prize for January in "Electric Railway Journal's" Maintenance Competition. A convenient attachment for pulling spikes submitted by Joseph Mercier receives honorable mention



Truck for testing axles, and for straightening them at the shops of the Birmingham Electric Company

STRAIGHTENING of bent axles by heating them, and then putting them in a lathe has been improved on by a method used in the shop of the Birmingham Electric Company, Birmingham, Ala. A truck with convenient centers for testing the axles, and on which they are straightened by means of a vertical hydraulic press, was described in the Maintenance Data Sheet Section of ELECTRIC RAILWAY JOURNAL for Jan. 21, 1928. This was awarded the monthly prize of $25 by the judges. A description of the device was submitted by A. Taurman, superintendent of equipment, way and structures, for the Birmingham Electric Company. This is the second monthly prize that has been won by Mr. Taurman, as his article on the use of Alemite fittings for lubricating half-ball brake hangers was awarded the monthly prize in the Maintenance Contest for May, 1927.

Mr. Taurman is giving great attention to improved equipment and better maintenance methods for keeping the rolling stock on his progressive property in the best possible condition. He is active in the Electric Railway Association of Equipment Men, Southern Properties, and was chosen vice-president at its recent meeting in New Orleans, Jan. 25-27, after having served as secretary. Biographical notes of Mr. Taurman's experience were published in the June 18, 1927, issue of ELECTRIC RAILWAY JOURNAL.

The truck described has a three-fold function. First, it provides a convenient means for testing eccentricity. Second, it provides a vehicle for transporting axles about the shop, and third, the axle can be straightened cold without removing it from the truck. A material saving in time and labor has resulted from its use.

Tie plates or cramped quarters sometimes interfere with effective removal of spikes, and prevent the use of a claw bar. The adaptation of the common form of ice tongs in a device for attaching to the spike, and for providing for the insertion of a lever to remove the spikes, as used by the Montreal Tramways, Montreal, Canada, and as submitted by Joseph Mercier, general foreman track service division of that company, received honorable mention by the judges. It will be recalled that Mr. Mercier won the second capital prize in the Maintenance Contest, which was awarded at the Cleveland Convention last October. A short biography of Mr. Mercier was published in the Annual Convention Number of ELECTRIC RAILWAY JOURNAL, dated Sept. 17, 1927.

TIME FOR SUBMITTING CONTEST ITEMS BECOMING SHORT

ACCORDING to the rules of the competition, manuscripts to be eligible for one of the monthly prizes must be submitted before April 30, 1928. This leaves but 2½ months remaining for those interested to get in their material. Many of those who have already submitted items in the contest have advised that they intend to submit additional items. A certain advantage will be gained by sending these in early, since space limitations prevent the publication of out a limited number in each group. It is evident that the articles published so far in the maintenance competition treat of only a few of those advanced practices which can be found in every maintenance department. In a visit to a moderate sized shop, the maintenance editor secured more than 50 items, all of a nature similar to those which are now being published in the competition.

The Maintenance Data Sheet Section in this issue contains another group of articles which were submitted in the competition. One of these will be awarded the $25 monthly prize for February. Results of the contest each month are published in the next issue devoted to maintenance and construction, which is the third issue each month.

* * *

The prizes offered are $25 for each monthly winner, to be selected from the articles published in the maintenance data sheet section. A minimum of $5 will be paid for each article accepted for publication.

Any employee of an electric railway or bus subsidiary may compete. The subject may be any maintenance practice or device for electric railway or bus repairs. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York City, on or before April 30, 1928.

Additional details were given in this paper for April 16, 1927, pages 700-701.

Electric Railway Journal Maintenance Data Sheet

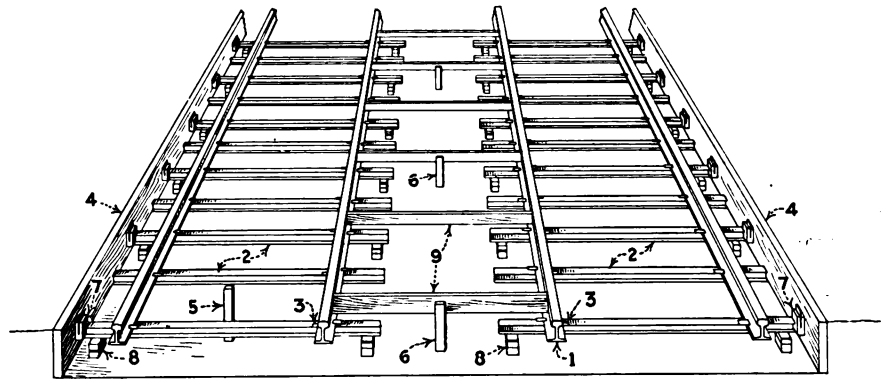
TRACK AND WAY DEPARTMENT—17

Conditioning Double Track for Concreting*

BY LOUIS T. BOTTO
Superintendent Maintenance of Way Department,
San Antonio Public Service Company, San Antonio, Tex.

IN THE work of preparing double-track lines for concreting as carried out by the San Antonio Public Service Company, the tracks are left on the subgrade until a sufficient quantity of material has been hauled in and placed at suitable intervals to supply the mixer for at least a day's run. The hauling of materials then continues ahead of the work as it progresses.

Three crews of men are employed in conditioning the tracks for concreting. The first is the leveling crew which consists of a leveler and three men. Grade stakes are placed on 30-ft. centers in the center of the track not used by the work trains, and the actual leveling is carried out in two operations. Tracks are first raised to approximate grade by blocking under every other tie for about 100 ft. ahead of the mixer.



Track conditioned for concreting

The process is then repeated and the tracks are brought to a true grade as indicated by the grade stakes. This is accomplished by the use of cypress shingles wedged on top of the blocking placed previously. On tangent tracks the two inside rails are made level with the grade

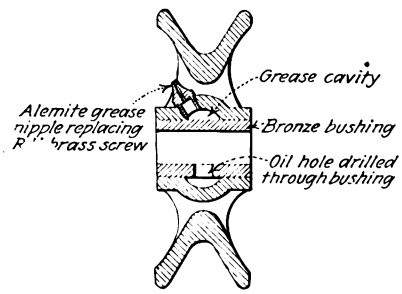
ROLLING STOCK—MISCELLANEOUS—22

Grease Lubrication for Trolley Wheels*

BY L. A. BRAMMER
Shop Superintendent Jamaica Public Service Company, Kingston, Jamaica, B. W. I.

FOR a long time the maintenance of trolley wheels has been a large item of expense on cars of the Jamaica Public Service Company. The wheel bushing, which is of the usual type of bronze filled with graphite, is lubricated with oil through an oil hole closed by a small brass screw, ¼ in. in diameter. Oiling was carried out on cars every night after a run of about 120 car-miles. The service obtained did not exceed 1,500 miles before chattering of the bushing and screeching of the wheel would occur. Ordinarily one wheel would wear out about four bushings before scrapping. A messy condition of the rope and roof was sure to result.



Alemite grease fitting applied to trolley wheel

To improve this condition the screws in the trolley wheels were replaced with Alemite fittings for grease lubrication and a regular grease gun with No. 00 density grease was used. Since the installation of these fittings lubrication is done but once every two weeks and the life of bushings has increased so that but two per wheel are now used. Rope and roofs remain clean, and to add to the appearance the roofs have been painted with aluminum paint. One pound of grease is now used every two weeks where originally two quarts of oil were consumed each night. The accompanying illustration shows the method of installing the Alemite fittings.

TRACK AND WAY DEPARTMENT—17

Conditioning Double Track for Concreting—Continued

stakes and the two outside rails are depressed a half inch.

A second crew sets the forms which are usually made of 2 in. x 12 in. boards in 16-ft. lengths. Two men work on each side of the tracks, place the forms and make them secure for the liners who follow them. The top of the forms is usually made to conform to the grade of the outside rails.

The third crew, which lines the tracks, is composed of five men. They work from a line of stakes placed on 10-ft. centers in the center of the dummy strip. Two of this crew key the tracks and secure them to exact line at each center stake by means of 2-in. x 4-in. spacers cut to exact length and placed between the heads of the two dummy rails to hold the exact gage, using blocks and wedges. The other three men follow the first two and complete the lining. One, by sighting down the rail, directs the other two in placing additional wedges, spacers or blocks to work the tracks between the stakes to exact alignment. After the concrete has set for about two hours, the spacers and any wedges that stick up out of the concrete are removed and are reused in the work ahead.

The crews employed on this work in San Antonio have had many years of experience and have become expert in their respective lines. They can condition for concreting 500 lineal feet of double track in eight hours. A great advantage in lining and surfacing tracks is obtained by placing the grade and line stakes, as outlined, close together, thus permitting the instrument man to do a very great part of the work.

Convenient Receptacle for Switch Irons*

By R. T. Chiles

Master Mechanic Cumberland County Power & Light Company, Portland, Me.

CONSIDERABLE trouble was experienced on cars of the Cumberland County Power & Light Company in keeping switch irons in place, due to not having a regular position. When they were hung on a support the inside trim of the car was damaged by the swinging of the switch iron. To overcome this trouble the company now uses a pipe receptacle. This is made of 1½-in. pipe 20 in. long. One end is threaded and is screwed to a 1½-in. floor flange. A round steel plate ⅛ in. thick of the same diameter and drilling as the floor flange is placed between the car floor and the flange and the receptacle is screwed in place. The steel plate prevents the switch iron from cutting holes in the car floor. Every car is equipped with two switch irons, each made of ¾-in. round soft steel, 28 in. over all in length and with a D-shaped handle. Receptacles for the switch irons are provided at each end of the car.

TRACK AND WAY DEPARTMENT—18

Oil Heaters for Thawing Frozen Switches*

By R. J. Fennell
Assistant Road Master Way Department
Toronto Transportation Commission, Toronto, Canada

PORTABLE type oil heaters are used during cold weather to overcome ice and frost when making paving repairs, to thaw out frozen switches and derails and to preheat rails for welding. Economy and flexibility have been gained through the use of a barrow type tank holder.

These heaters are of the high-pressure oil-burner type. They consist of a burner, a rubber hose and a 15-gal. fuel storage steel tank. Previous heaters of similar general type required two and frequently three men, depending on the class of work.

The barrow type tank holder has an adjustable arm that allows the burner to be set to any desired position. Meanwhile the operator manipulates the flame by movement of the barrow. The equipment is compact, which is of advantage for rapid clearing of track where work is done under traffic. Only two men are required for operation.

ROLLING STOCK—MISCELLANEOUS—24

Test Equipment for Door Engines*

By G. R. Fanning
Foreman Pneumatic Section Hillcrest Shops,
Toronto Transportation Commission, Toronto, Canada

FOR testing door engines for leaks, speed and amount of cushioning, a platform with a heavy wooden frame, on which doors and a step are hung, is used in the shops of the Toronto Transportation Commission. The folding doors on this testing set are reduced in size to 4 ft. high x 4 ft. 9 in. wide over all, so that the engine can be handled easily. To compensate for this the panels of the doors are filled in with iron plates so that they have exactly the same weight as the doors used on cars in service.

Door engines, after being overhauled, are placed on a bed and are held there by two solid pins in the bedplate. The arms are left in position on the door adjusting screws and when the pin is placed through the gear shaft and arms, the door is immediately ready for test. While a door is being operated, leaks are found readily and are repaired. Also the speed of the doors and the amount of cushioning can be adjusted easily so that, when the engine is installed on the car, continuous service is assured and no time is lost through faulty operation.

The sliding doors are hung under the bedplate of the folding doors and weighted to correspond with doors in operation on cars, being reduced in size to 3 ft. 9 in. by 3 ft.

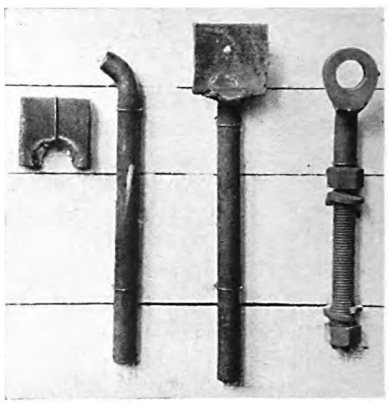
TRACK AND WAY DEPARTMENT—19

Connecting Rod for Electric Track Switches*

BY P. F. GERHART
Superintendent Line Department, Harrisburg Railways, Harrisburg, Pa.

DUE to increased weight of track switch tongues, difficulty has been experienced by the Harrisburg Railways from the usual type of connecting rod used with switches when electrically operated. To overcome the difficulty, rods are now made in the company's shops. A piece of 1-in. round soft steel is cut to the required length. By clamping it to the welding table the protruding end is shaped by being heated with a torch and bent to the proper angle with a piece of 1-in. pipe.

For forming the end which is to contain the eye, a piece of 1-in. flat soft steel 3 in. square is notched out on one side by the acetylene torch. This is welded to the round rod. In the welding the rod is raised 1 in. above the welding table, the square piece resting on the table. This makes an offset of 1 in., which is just right for use on this property. The outside of the eye is dressed up with an acetylene torch and the hole for the connecting link is drilled. The rod is then threaded for 1-in. nuts. In some places the standard 1-in. nuts are too large on the outside, and to meet this condition $\frac{7}{8}$-in. nuts are tapped out with 1-in. threads, and used.



The finished rod for the connecting links of electrically-operated switches is shown at the extreme right. The small square piece of iron on the left is welded to the bent arm of the rod shown next to the right. The finished rod, before machining, is shown in the third illustration

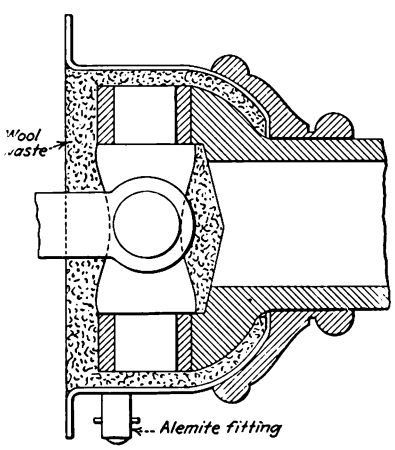
Wool-Waste Packed Universal Joints*

BY CHARLIE HERMS
General Foreman San Diego Electric Railway, San Diego, Cal.

THE accompanying sketch shows a wool waste packed universal joint as used by the San Diego Electric Railway. When packing this joint, a good grade of long-yarn wool waste is used and this is soaked not less than 72 hours in a good grade of transmission grease, preferably one having a fiber base. The universal joint should be opened enough so as to permit free insertion of the waste and this should be packed tightly. Strands of waste should be just as long as possible as results will be better with long-yarn waste. After the joint is packed and assembled it should be filled with a good grade of universal joint grease by means of forced lubrication. Heavy transmission grease has been found most satisfactory by the San Diego Electric Railway.



Wool waste lubricated universal joint

By use of waste packed universal joints the throwing of the grease is eliminated, which is common with most all makes of joints due to centrifugal force. The replacement of worn-out universal joints is reduced since more perfect lubrication is obtained. The time and labor of lubrication is considerably less with the wool waste packed joints since there is very little lubricant used and there is no danger of the joint running dry if inspected at reasonable intervals.

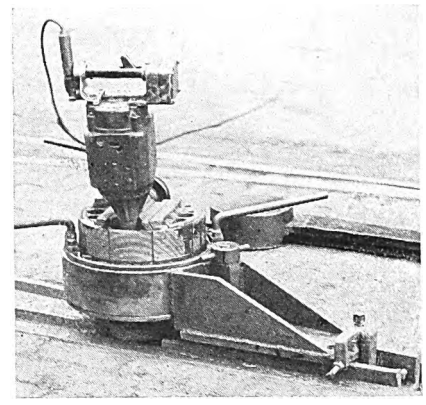
TRACK AND WAY DEPARTMENT—20

Machine for Grinding Heel Recess in Switch Castings*

By W. J. McCallum
Foreman Frog Shop Way Department, Toronto Transportation Commission, Toronto, Canada

SWITCH castings worn oversize at the heel recess are rehabilitated by the way department of the Toronto Transportation Commission, Toronto, Canada, which has developed the grinding machine shown in the accompanying illustration. When the tongue and casting are worn beyond allowable limits, the heel recess is built up first by welding, using manganese rods, and then is ground out to standard diameter by the grinding machine. All of this work is done at night.

The machine has a bracket to hold and control a portable electric hand grinder which is provided with vertical and horizontal feeds. By means of an annular guide, the grinder is capable of being swung through a complete circle. It is held in position by clamping the extension arm into the recess left by the switch tongue. The arm is made reversible for right- and left-hand castings. Car passes are permitted during the progress of the work by removing the grinder and dropping in a temporary tongue with a small heel. In this way oversized recess castings are made standard and undersized tongues are taken to the shop where repairs are carried out in a similar manner.



Equipment used for grinding the heel recess in switch castings

Automatic Test for Control Jumpers*

By Harvey L. Bullock
General Foreman of Electrical Equipment North Station, New York Central Railroad, White Plains, N. Y.

FOR testing electric car jumpers to comply with the I.C.C. rules for inspecting and testing locomotives other than steam, a machine has been designed and built in the electric shops at the White Plains, north station of the New York Central Railroad. The rule provides that jumpers used between units carrying a potential of 600 volts or over shall be tested by immersing the cable portion in water and subjecting each conductor, one with the other, and with the water, to a difference in potential of not less than 1¾ times the normal working voltage for a period of not less than one minute.

With the equipment provided, all that is necessary is to start the machine. If a conductor is defective, the machine comes to a stop, cuts off the high-tension current and rings a bell to call the attendant, the defective wire being indicated on a dial. The machine stops automatically when the test is completed.

A timing element is provided in the equipment which energizes a magnet valve, which in turn allows compressed air to operate a small air cylinder connected to a series of star wheels, levers and cams. Connections are interlocked with the contacts on the dial to allow exact timing. The dial at the right as shown in the accompanying illustration moves every minute, and the dial on the left moves every twenty minutes. When this latter dial has made one complete revolution, the test is complete, there being twenty wires in the jumpers used on the New York Central locomotives.

This device not only saves the time of an operator several hours per day but is also a safety measure on account of obviating the handling of the high-tension current.

TRACK AND WAY DEPARTMENT—21

Grinding Out Rail Corrugations*

BY F. J. MARTIN
Superintendent of Maintenance Pittsburgh Railways, Pittsburgh, Pa.

RAIL corrugations are ground out with two shop-constructed cars on the Pittsburgh Railways, Pittsburgh, Pa. Obsolete single-truck cars were rebuilt to house the air cylinders and grinding block-adjusting mechanism. A 25-ft. compressor supplies the air for the cylinders, which furnish the pressure to the grinding blocks. Two 16x60-in. air reservoirs and a 275-gal. water tank are housed inside the car body.

The air cylinders that furnish the pressure for the grinding blocks are controlled by modified Westinghouse M-20 brake valves. They can be operated by the motorman from either end of the car. The grinding bricks used are of standard material 2½x4x10 in. They are held in a cast-iron box 24x3 in. There are two boxes on each side of the car, each box holding four bricks separated by standard spacers.

ROLLING STOCK—ELECTRICAL—41

Bushing for Carrying Motor Leads Through Frame*

BY BENJAMIN H. HALL
Shop Foreman West Penn Railways, McKeesport, Pa.

INSULATING bushings of the type illustrated are used by the West Penn Railways for carrying motor leads of Westinghouse No. 56 motors through the cast-steel motor shell. All armatures and field leads which connect to the main car cables pass through this bushing. It is made from ash and then dipped and baked in insulating varnish to insure more perfect insulation. After the wires are put through the bushing they are taped with a couple of layers of heavy tape and a layer of canvas. This provides good insulation and protection against water and mud.

A similar type of bushing but of different dimensions was used previously. With the old-style bushing, the extension on the outside of the motor case was but ⅜ in. and the tape and canvas would not stay on. Splashing of water caused considerable trouble. The old bushing also did not support the wire sufficiently to prevent vibration of the leads while cars were rounding curves. The leads would work back and forth and twist off the strands. The new-style bushing is made with a ¾-in. extension outside of the motor case. This additional amount is satisfactory for taping so as to hold the leads more rigid. It is held in place by a brass collar that fits over a shoulder on the bushing and is fastened to the motor case by 2½-in. No. 14-24 round head machine screws.

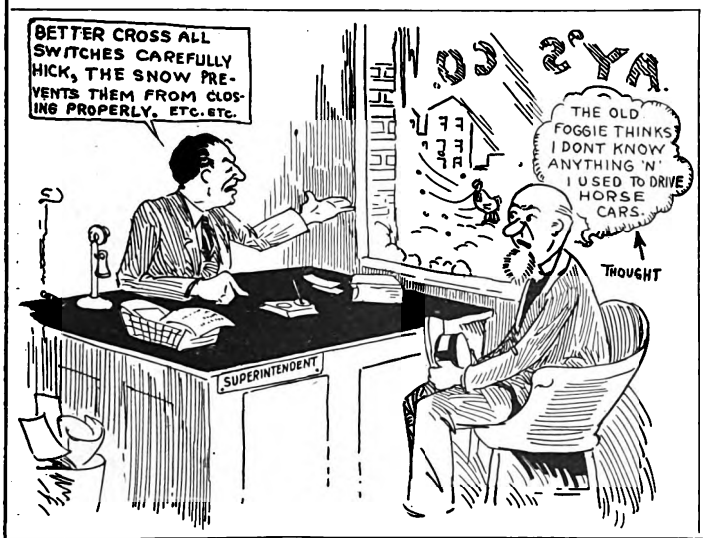
Adventures of

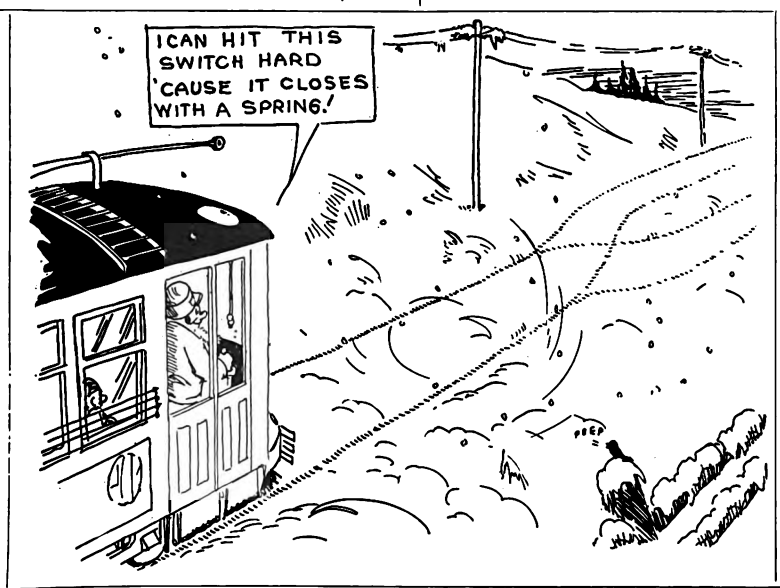
Old Man Trouble

on the

Hicksville Railway

Because switches are operated by electric power or a spring is not sufficient reason to assume that they are closed





SNOW, ice, sand and dirt prevent mechanically operated switches from fulfilling their duty during snow and rain storms. Time and repairs are saved by stopping the car before pulling across a switch point which cannot be seen. If a fast-moving car splits a switch, the brakes cannot be relied upon to stop the car before the motor leads and brake riggings are stripped.

ELECTRIC RAILWAY JOURNAL will be glad to furnish press proofs of this page for posting on bulletin boards and will supply electrotypes of this series at cost for use in company publications.

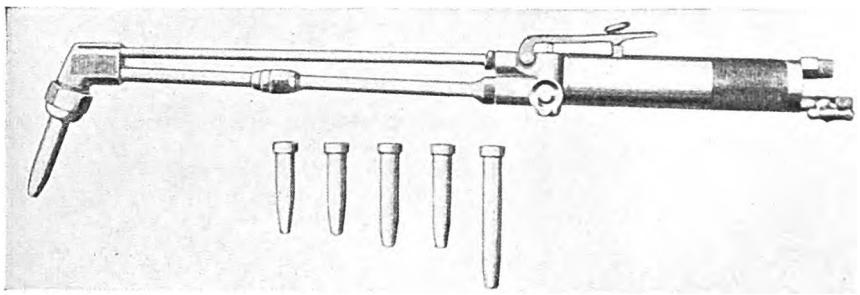
New Equipment Available

Combination Cutting and Welding Torch

CUTTING or welding is possible by interchange of tips in a new lightweight torch announced by the Alexander Milburn Company, Baltimore, Md. It is made for use with oxygen and acetylene, oxygen and hydrogen, or other gases. The new torch is designated Type RI. It is extremely light for the range of work it performs, weighing 40 ounces. Only two gas tubes are used instead of three, as is common in other torches. The high-pressure cutting oxygen thumb button, which remains fixed in either open or closed position without sustained pressure, and the bronze forged torch head and valves having a tensile strength of 60,000 lb. per square inch are additional features.



Combination cutting and welding torch

Gas-Electric Cab

GAS-ELECTRIC drive for taxicabs is the latest development in the transportation field. The drive has been designed by Mitten Management engineers, and constructed under their supervision, with General Electric Company equipment, on a Willys-Knight chassis. One of these cabs is being operated in Philadelphia for experimental purposes.

The transmission and rear axle were removed from the Willys-Knight chassis and electric transmission was substituted. A generator, driven by the gasoline engine supplies current to the electric motor which is attached to the frame, and which drives the propeller shaft. There is no gear lever or clutch, the accelerator increasing or decreasing the speed in accordance with the pressure exerted by the foot. The only other foot lever is the brake pedal. The cab is placed in reverse by a small switch attached to the driver's seat.

Smoother and quicker acceleration, especially desirable in taxicabs which operate in heavy traffic, as well as lower maintenance cost and longer life, are outstanding advantages claimed for the gas-electric cab. A feature is the right-hand door to the back compartment which is controlled by the driver and which can be opened only from the driver's seat. This precaution was taken as a safety measure for passengers who might possibly attempt to alight with the cab in motion or with an obstacle in the way. The interior of the cab is upholstered in mohair and has been designed to provide ample seating room for five passengers.

New type of gas-electric taxicab being tested in Philadelphia

Large Wheel Truck for Oxy-Acetylene Equipment

LARGER wheel size was a primary consideration in the design of a two-wheel truck put on the market by the Oxweld Acetylene Company, New York, N. Y. Larger wheels make the truck much easier to handle. The illustration shows the new truck equipped with 24-in. steel wheels, having 3-in. x $\frac{3}{8}$-in. grooved tires and a cast-iron hub. The hub is bored to fit the cold-rolled steel axle and a grease cup is provided. Lubrication is of particular importance where the truck may be hauled long distances at fairly high speed behind a motor truck.

Among other improvements, the handle is continuous and the upper portion is bent back about 8 in. so that the truck can be handled easily by an operator of small stature. The tool box is large and is provided with a cover and a holder for extra blowpipe tips.

Truck with 24-in. wheels

Where 24-in. wheels are not required, 14-in. wheels may be used instead merely by changing the position of the axle to the lower set of holes which are already drilled in the frame. The same frame and axle can be used with either size wheels. No grease cups are necessary with the smaller wheels.

Small Blow Torch Outfit

FOR operations such as soldering and brazing where a low-flame temperature can be used to advantage, an inexpensive outfit has been developed by the Prest-O-Lite Company, Inc., New York, N. Y. It consists of a light blowpipe handle and a set of special tips to give flames suitable for a wide range of work. The outfit is most conveniently used with a small gas tank such as those standard for motorcycles or trucks and a 6-ft. length of hose. Small furnaces for heating lead, paraffin and the like can also be heated with the same outfit.

It is claimed that acetylene has advantages over other means of heating

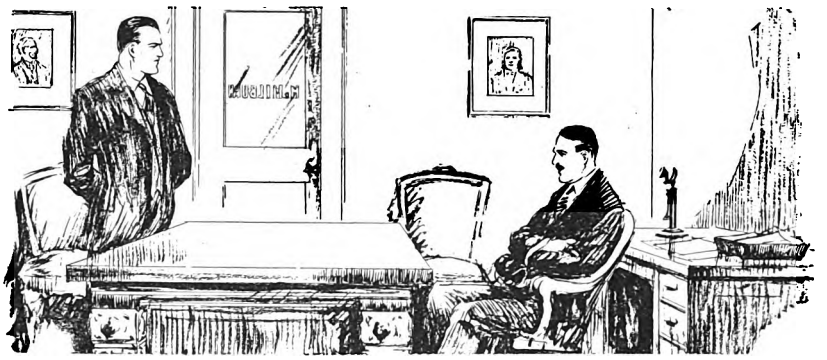
Using the blow pipe for soldering

for this class of work, as it produces a high flame temperature and the flame is non-oxidizing and non-carbonizing. No preheating is required and in operation it is necessary only to turn on the gas, light the torch and the job is under way. Soldering may be done either with one of the tips or the blowpipe may be converted into a soldering iron by slipping the soldering copper over the end of the blow torch tip and tightening a single set screw.

The outfit is particularly convenient for electric work on poles or underground in inaccessible places. Painters use it for burning off paint. New uses in the shop are being found constantly.

Dick Prescott Gets a Surprise

And a Promotion



ON THE appointed morning, following Mr. Milburn's inspection of the newly painted car in the Consolidated Railway & Light Company's shop, Dick Prescott, young assistant superintendent, reported at the general manager's office.

When Dick was ushered in, he found Mr. Milburn in no hurry to get into the subject of their conference.

"How long have you been with the company, Dick?" suddenly asked Mr. Milburn.

"Just about four years."

"That's right, I remember now, you joined the company just a few weeks before I came on the property.

"Yes, sir, and I think the company has been making some real progress during that period."

"Tom Mullaney speaks very highly of you, Dick, and gives you credit for much of the progress that has been made in the shop."

"He's very considerate, Mr. Milburn, for after all Mr. Mullaney has backed up my work and has carried the responsibility for the success of any suggestions I may have made."

"You're not afraid of responsibility yourself, are you Dick?"

"No, sir, I don't think I am. Fortunately, I've had the co-operation of all the foremen in the shop. We thrash things out pretty thoroughly before making any important change in practice, and when we decide to go ahead, I'm pretty sure of my ground."

"Fine, Dick! That kills two birds with one stone; it wins you the co-operation of your foremen and at the same time enables you to check your own judgment with their experience. That's my idea of developing team work in an organization."

"I believe, Mr. Milburn, that this business of ours requires a lot of team work all the way up and down the line.

"Right again, Dick. I've noticed that you seem to have sensed the thrill that comes from this game of rendering transportation service to the public, and that you have succeeded in transmitting your own spirit to those around you."

"Thank you, Mr. Milburn."

"That isn't all, Dick. I've got some real news for you. Tom Mullaney is going to retire. He hasn't been very well lately and so he's going to move out to that farm of his. I have therefore decided to make you superintendent of equipment in full charge of the department, effective immediately. That was Mullaney's suggestion as well as my own idea."

This momentous news came as a complete surprise to Dick. There flashed through his mind the memory of his keen disappointment at having to leave college and of his humiliation upon being forced by necessity to seek an humble job in the Consolidated shop. For a moment he was overwhelmed by his feelings and struggled valiantly to recover himself.

"Gee! Mr. Milburn," he finally managed to stammer. "I—I hardly know what to say."

"Don't say a thing, Dick. Your record speaks for itself. You have earned the promotion by your spirit and your work. I have great confidence in your ability to carry this increased responsibility with credit to yourself and the company."

The general manager chatted cordially for awhile, outlining some of his hopes for the property. He suggested that Dick take a few days to adjust himself to the new conditions before endeavoring to discuss the work of his department.

As Dick started back toward the shop he could scarcely believe that it was all true and that he was actually to be in charge of the equipment department. After he had boarded a car and settled down in his seat, his mind reverted again to his early days in the Consolidated shop. Thoughts crowded in upon him until he was hardly conscious of his surroundings. Thus deep in reverie, he suddenly realized that he had reached his destination.

"Gee!" thought Dick as he arose to alight; "I wonder what the gang will think about this when they get the news."

Association Activities

Maintenance vs. Repairs*

By Gus C. Kraus
Assistant to Superintendent of Rolling Stock and Shops, New Orleans Public Service, Inc.

SUCCESS attained with any program for keeping cars in serviceable condition depends almost entirely on the organization that is behind it. Our organization in New Orleans is divided into three departments—practical, engineering and statistical. The assistant to the superintendent is the head of the practical department, and is in charge of all shops and carhouses. He is responsible for all work done on the cars. The equipment engineer is responsible for all engineering work. The chief clerk is responsible for the keeping of all mileage, material and cost data. These three heads report directly to the superintendent of rolling stock and shops.

The overhauling of all equipment is done at our Carrollton shops, where cars are received after completing 40,000 car-miles of service, or on an average of once every twelve months. From mileage reports of the statistical department, cars are sent to this shop by orders from the office of the superintendent of rolling stock and shops.

Briefly, overhauling consists of removing motors, line breakers, circuit breakers and air compressors from the car; replacing them with tested units that have previously been placed in as near their new condition as possible. At the same time, trucks, brake rigging, air piping, door mechanism, controllers, car wiring and minor units (such as trolley poles, harps and wheels) are carefully checked and overhauled as required, so that they may safely give 40,000 more car-miles of service without the threat of an equipment failure.

All overhauling, with the exception of armatures, is done under the supervision of the shop foreman, but overhauled units must be tested by the shop engineer and have his o.k. before they may be placed on a car. This engineer also has charge of all armature work, since this work requires almost continuous electrical testing. Electrical tests, such as resistance measurements, high-potential tests, motor running-in and load tests, etc., are made by the engineer, or under his direction. A detailed outline of motor overhauling and testing procedure used in New Orleans appears at the end of this paper.

We do not permit any "jumping" or "cutting-out" of armature coils. It has been our experience that due to the localized heating which is set up, a cut-out coil will cause flat spots on commutators, weak brush-holder springs, rapid brush wear, commutator flashing and undue destruction of coil insulation. Furthermore, the rating of the motor with jumped armature coils is necessarily changed.

The overhauling and painting of car bodies is done at our Magazine shops. Cars are received there on an average of once every eighteen months, the work done depending entirely upon the condition of the car. For example, paint work may be either a "cut-in" job or the old paint may be burned off completely and the surface brought up new. The latter process requires about fourteen days. Cars have their paint burned off on an average of once every nine years.

In addition to overhauling and painting car bodies, the only other work done at the Magazine shops is maintenance work for the car stations. This consists of boring and fitting wheels, repairing doors and sash frames, and such forging and machine work as may be required between the 40,000-mile overhauls.

No Parts Are Made in Shops

Every effort has been made to eliminate manufacturing of any kind, since we feel that without a fully equipped laboratory and the services of a metallurgist we could not compete with those manufacturers who continually improve the quality of their products by experiment and research. Toward this end, we have closed our foundry and have noted a saving of between $9,000 and $10,000 per year in the cost of car material. Our present outlay for all castings, brasses, brakeshoes, etc., is 80.3 cents per 1,000 car-miles. This cost is based on the material used during the twelve-months period ending Oct. 31, 1927, which amounted to $11,395,98. The total mileage during this same period was 14,188,380.

Reducing manufacturing activity in a railway shop saves valuable floor space and makes it available for maintenance work. For example, with our shops becoming more and more cramped for room, we contemplated the erection of new shops, at an estimated cost of $1,500,000. The yearly fixed charges, including interest, depreciation, taxes, etc., which amount to 15 per cent of the above, sum, would total $225,000. This is within $60,000 of the total maintenance cost on our cars. Now, at a cost of only $20,000 we have changed over our present shops into better-arranged, better-lighted and better-ventilated shops that afford us sufficient room for our present needs after manufacturing work had been eliminated. We have provided a complete equipment of modern tools and the proposed new shops have been placed in the 1932 budget.

The amount of work done at the car station in New Orleans has been reduced to a minimum. For example, in case of a motor failure, the motor is not removed at the station. Instead, the car is sent to the overhauling shop for an exchange of motor equipment. In this way the car can be completely checked to study the cause of the failure and prevent recurrence. The principal work at the car stations consists of making a regular 1,000-mile car inspection. Brakeshoes and wheels are changed as required, and all stations are provided with wheel grinders for grinding both new and old wheels.

It is the aim of our organization to standardize equipment to the greatest extent possible. Changes in standardization can be made only by an order of the superintendent, which is issued after an agreement has been reached by department heads. A continuous check is being made of material that is out of date and may be obsolete. Old tools are scrapped when it can be shown that new equipment can do the work better, and at the same time earn the interest on the necessary investment. New tools and equipment are being devised continually to facilitate overhauling work. Experimental material is placed on test and records are carefully kept to find how serviceable this material proves to be.

Department head meetings are held once a week in the superintendent's office, at which routine matters are handled. A meeting of department heads, station and shop foremen and engineers is held once a month. At this meeting the organization is furnished with detailed costs for each station and shop.

In order to provide for the training of its men along lines which will be helpful to them in their work, the company has created an educational department, which conducts night classes in practical electricity, shop arithmetic and accounting. In the practical electricity class a particular effort is made to tie in theory with actual street railway operation.

Our practice is based on the principle that proper overhaul of cars at definite periods reduces maintenance costs to a minimum. This reduction in costs

*Abstract of a paper presented at the meeting of the Electric Railway Association of Equipment Men, Southern Properties New Orleans, La., Jan. 25-27, 1928.

Digitized by Google

is secured by the elimination of repairs between overhauls. At the same time the value of having cars in such condition that they will operate without a failure is worth more than the money saved through the elimination of these failures, since it secures the good will of the public.

Method of Overhauling and Testing Railway Motors

Railway motors are overhauled on a 40,000-mile basis. This overhauling is done at the Carrollton shops, under the personal supervision of the shop foreman and the engineer in charge of tests.

After 40,000 miles of service each car is sent to the Carrollton shops for overhaul. No motors are removed from cars at any time at any of the five carhouses. When the car is received at the shops the trucks are run out from under the car body, the motors removed from the trucks and the armature is removed from each motor.

In regard to the armatures, the term "dipped and baked" refers only to armatures out of overhauled motors. The armatures out of motors which fail in service are known as "rewound" armatures.

If dipping and baking is all that is required for an armature, the procedure is as follows:

1. A "bar-to-bar" test is given to determine if there are any loose connections, open circuited coils, or short circuited bars.
2. A high-potential test of 1,300 volts (at a frequency of 60 cycles) is made for one minute to determine if there are any grounded bars or coils.
3. Core and end bands are removed.
4. Dressings on both ends of the armature are removed.
5. All low coils have fillers placed on top of them in order to get pressure on top of the coil when the armature is rebanded.
6. Core bands are replaced.
7. The armature is preheated at least four hours at an oven temperature between 220-225 deg. F.
8. The armature is dipped, remaining in the dipping varnish a sufficient time to allow the varnish to fill all crevices so that air bubbles cease rising to the surface of the varnish. Specific gravity of the varnish is maintained between 0.835 and 0.845.
9. The armature is returned to the baking oven and remains there for 36 hours. The oven temperature is maintained between 200-225 deg. F.
10. The armature is redressed.
11. End bands are replaced.
12. The commutator is turned, taking the lightest possible cut across its face, and then polished with No. 00 sand paper.
13. The commutator is slotted, if necessary.
14. A second bar-to-bar test is given the armature to check up, as in item 1.
15. A second high-potential test of 1,300 volts for one minute is given the armature.
16. Armature bearings are properly fitted to the shaft.
17. The armature is returned to the motor assembly floor to be replaced in an overhauled frame.

Rewound armatures are handled as follows:

1. Armatures are stripped of old coils, core slots are cleaned and commutator necks are prepared for new coils.
2. The armature is rewound.
3. The armature is preheated in oven at least fifteen hours at a temperature ranging between 220-225 deg. F.
4. Temporary bands are placed on armature.
5. The armature is dipped in the manner previously described.
6. The armature is returned to the oven and baked for 48 hours at a temperature ranging between 220-225 deg. F.
7. Temporary bands are removed from the armature, fillers are placed on top of low coils, the armature is redressed and then banded.
8. The commutator is turned up.
9. The commutator is slotted, if necessary.
10. A bar-to-bar test is made.
11. A high-potential test of 1,800 volts for one minute is given the armature.
12. Armature bearings are properly fitted to the shaft.
13. The armature is returned to the motor assembly floor to be replaced in an overhauled frame.

After an armature is removed from the motor frame the latter is thoroughly cleaned of all dirt or other foreign material. The fields are then tested as follows: (1) A "hammer" test is made to determine if the insulation is apparently in good physical condition, and if any of the coils are loose in the shell; (2) the resistance of the field coils is measured to see if it checks with the standard; (3) a high-potential test of 1,750 volts for one minute is given to determine if the coils show sufficient insulation strength; (4) polarity of any new fields which may be used is checked.

The following general work is done on motor shells: (1) The interior of the motor shell is sprayed with air-drying insulating varnish; (2) the motor leads are carefully examined and defective leads are replaced. All motor leads are then treated with a flexible insulating paint; (3) brush-holders are removed, put in first-class condition and replaced; (4) armature bearings are pressed into end housings.

After complete overhauling, the motor armature and frame are reassembled. The resistance of the motor armature is then secured, and the brush pressure checked. A running-in bearing test is then given the assembled motor by operating the motor at no load for at least fifteen minutes to see if any hot bearings develop.

The load test is the last test given a motor before it is replaced under the car. This load test has only been given recently, and is used on only a certain proportion of the overhauled motors. The present load test practice is to operate the motor under 150 per cent of its hourly rating for 7½ minutes in each direction of rotation.

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 2 — **Metropolitan Section, American Electric Railway Association, Engineering Societies Building, New York, N. Y.**

March 13-15 — **Oklahoma Utilities Association, annual convention, Tulsa, Okla.**

March 14-15 — **Illinois Electric Railway Association, Springfield, Ill.**

March 21-22 — **Central Electric Traffic Association, Seelbach Hotel, Louisville, Ky.**

March 23 — **Maryland Utilities Association, annual meeting, Emerson Hotel, Baltimore, Md.**

March 30 — **Executive Committee American Electric Railway Association, 292 Madison Avenue, New York, N. Y.**

May 2-5 — **Southwestern Public Service Association, Dallas, Texas.**

May 6-12 — **Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, biennial meeting, Rome, Italy.**

June 6-8 — **Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.**

June 20-27 — **American Railway Association, Div. 5—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), annual convention and exhibit, Atlantic City, N. J.**

June 21-22 — **American Railway Association, Motor Transport Division, Atlantic City, N. J.**

June 28-29 — **Central Electric Railway Association, Cedar Point, Ohio.**

July 8-12 — **Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.**

July 25-27 — **Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio.**

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

New Officers for Wisconsin Motor Association

NEW officers were elected at the annual meeting of the Wisconsin Motor Coach Association held in Milwaukee on Jan. 20. These will hold office during the present year.

President, H. G. Monger, Milwaukee Electric Railway & Light Company, Milwaukee; vice-president, F. L. Neilson, La Crosse & Southeastern Transportation Company, La Crosse; treasurer, M. H. Frank, Wisconsin Power & Light Company, Fond du Lac.

Executive committee: Above officers and A. M. Schrum, Gray Transportation Company, Milwaukee; W. J. Kay, Northland Transportation Company, Minneapolis; B. W. Arnold, Chicago, North Shore & Milwaukee Railroad, Milwaukee; and N. C. Rasmussen, Wisconsin Valley Electric Company, Wausau.

Digitized by Google

Illinois Utilities Announce Joint Meeting

ON MARCH 14 and 15, the Illinois Electric Railways Association will hold a joint meeting with the Illinois State Electric Association and the Illinois Gas Association in Springfield, Ill. The program will be announced later.

Southwestern Transportation Men Meet

PUBLIC relations, traffic regulation, traffic congestion, de luxe equipment as a means of increasing rides, and the increase of car speed as a means of obtaining increased passengers, were the principal subjects discussed at a meeting of the transportation and public relations division, railway section, Southwestern Public Service Association, at the meeting held in Fort Worth, Tex., early this month. The meeting was conducted by L. E. Thorn, chairman of the transportation division, and A. B. Paterson, chairman of the railway section, together with Secretary E. N. Willis of the association. The attendance was good. Companies from San Antonio, Fort Worth, Dallas, Houston, Waco, Shreveport and New Orleans were represented.

The next meeting of the association will be held in Dallas, Tex., May 2-5.

Publicity Representative Proposed for C.E.R.A.

EMPLOYMENT of a joint representative for the purpose of delivering addresses before the various clubs and civic organizations, chambers of commerce, etc., in the territory served by the Central Electric Railway Association, was proposed by the publicity committee at the Cincinnati meeting. It was also proposed that such representative deliver similar talks in territories outside the immediate association territory, such as the Southern states to which new joint through-rates have been established.

Secretary L. E. Earlywine has addressed a circular letter to the members of the C.E.R.A. requesting their views on the desirability of the plan and whether they will subscribe to the expense of employing such a representative.

New Central Association Groups Proposed

MEMBERS of the Central Electric Railway Association have been sent a circular letter by President W. S. Rodger relative to the proposal made at the annual meeting held in Cincinnati to the effect that two new associations be formed. These, which would be similar to the Traffic Association and the Master Mechanics Association, would handle the work of the power distribution and track and roadway committees, which were authorized last year following the summer meeting.

The executive committee, to which the matter was referred for disposal, decided to solicit the views of the member companies regarding the advisability of organizing these two subsidiary associations. It was the feeling of the members of the executive committee that the same necessity does not prevail for associations to handle power and roadway questions that exist in connection with matters being handled by the present subsidiary associations, as neither track nor overhead power equipment is interchangeable between the railways. The executive committee is asking members to give their views on the subject.

American Association News

Standing Committee on Power Assembles

SPECIAL committee chairmen of the power division met at Cincinnati on Jan. 25, to report the work of their respective committees. Reports were made for all committees except numbers 3 and 13.

D. L. Smith, chairman special committee No. 5, proposed a division of the catenary specifications into light and heavy construction, and further, a segregation of materials for direct suspension, light catenary and heavy catenary construction, as a basis for this year's work of his committee. H. S. Murphy reported for committee No. 6 that the main line mileage will be separated this year from the yard and siding mileage in the tabulation of data on trolley wire wear. Also, that statistics will be prepared on a basis of 100,000 or 1,000,000 car-miles.

The preliminary report of committee No. 2 was read by H. W. Codding, on the subject of mercury arc rectifiers. All sections of the report except one were approved by the standing committee. John Leisenring reported that committee No. 11 was uncertain of the purpose of its assignment. A discussion of overhead versus underground distribution cables followed. It was generally agreed that for the purpose of comparison the committee should undertake to obtain data on initial costs of installation including fixed charges, maintenance costs and maintenance problems; also, the reliability and length of life of the two types of construction.

J. W. Allen, reporting for committee No. 1, stated that eighteen of the 30 sections of the Manual to be checked, had been reviewed and that few changes had been made. J. F. Neild submitted a statement of the activities of committee No. 8 and a drawing showing a proposed series of standard reels. W. J. Quinn reported for committee No. 7 that there had been no recent activities of the American committee on inductive coordination. He stated also that sufficient information on radio interference was available to warrant its assemblage in one report.

Manufacturers' representatives, according to C. E. Bennett of committee No. 4, are preparing a preliminary report outlining the advantages and disadvantages of the segregation of control apparatus and power apparatus. Mr. Bennett reported also for committee No. 10 and stated that various schemes for protecting both line and cars have been discussed. The committee decided that it was preferable to ground the arresters to the rail rather than to install separate ground rods; and also, that the committee was not in favor of connecting rails and ground rods together. A general discussion developed with differences of opinion among the members present as to the proper method of grounding lightning arresters.

Committee No. 9, represented by A. J. Klatte, was requested to compare the conduit specifications in the Manual with those of the American Railway Association. It was also suggested that manufacturer members be asked to offer their suggestions as to desirable revisions. H. S. Murphy reported that his committee, No. 12, was gathering data on the use of non-ferrous materials for overhead construction on electrified railroads.

H. E. Bachman was appointed the Association's representative on technical committees 5 and 10 of the A.E.S.C. sectional committee on insulated wires and cable, to replace M. B. Rosevear, who resigned.

Those present at the meeting were W. E. Bryan, chairman; C. E. Bennett, C. A. Butcher, A. J. Klatte, A. Schlessinger, L. W. Birch, John Leisenring, J. F. Neild, W. J. Quinn, D. L. Smith, H. W. Codding, H. S. Murphy, C. S. Anderson, representing W. H. Bassett; J. W. Allen, and G. C. Hecker. H. L. Swift, Cincinnati Street Railway and J. C. Bailey, Columbia Engineering & Management Corporation were guests.

A.E.R.A. Joins in Better Copy Contest

THREE great national utility associations have now joined the Public Utilities Advertising Association in conducting the Better Copy Contest. The entry of the American Electric Railway Association followed the entry of the National Electric Light Association and the American Gas Association.

The electric railway group will act jointly with the Advertising Association in the competition which covers the electric railway and bus transportation fields. The three awards for the best public utility advertisement in this group will be presented under the auspices of the A.E.R.A. in conjunction with a joint committee of judges representing both sides. The contest in this division is open to all public utility operating companies providing electric railway or bus transportation service.

Prospects Dim for Legislation

Committees entrusted with shaping future policy of state toward Boston Elevated agree to disagree

IT IS beginning to look on Beacon Hill as if the Massachusetts Legislature again would get into such a hopeless tangle over the Boston Elevated situation that it will be unable to extricate itself during the pending session. Its two committees, the metropolitan affairs and the street railway committees, which are handling the matter, are torn by internal dissentions over developments. The vote to reject a motion to invite the Boston Elevated directors to appear and offer some plan for the future in the interest of the stockholders is regarded as a blunder. They have voted to hear counsel Frederick E. Snow, in executive session instead. Some of the minority members of the committees are so bitter over this move that they declare they will bolt the executive session if Mr. Snow appears to discuss the Elevated behind closed doors.

The Voice of the Stockholder Should Be Heard

The move to invite the directors was made by Representative Eliot Wadsworth, who is opposed to the Harriman plan for the extension of public control. He argues that thus far Elevated stockholders have declined to accept plans put forth by the Legislature. Since it has been reported to the committees that the Elevated directors will advise the stockholders to reject the Harriman plan now pending, Mr. Wadsworth says the time has arrived for a reversal of that policy. Stockholders should be permitted to advance plans to which the Legislature may say "yes" or "no."

The trend of the discussion mostly concerns the return of the property to the owners, and the extreme opposite—purchase by the Commonwealth and public ownership. Prof. Philip Cabot of Harvard University, advocated return of the property to the owners. James F. Jackson, former chairman of the Elevated Board of Public Trustees, recommended adherence in the main to the Harriman plan for extending public control for fifteen years. Frank A. Goodwin, registrar of motor vehicles, is urging state ownership and Representative Martin Hays would turn the property back to the stockholders. Public sentiment is swayed and changing. Hardly two leaders who appear in public seem to think alike on the subject today. The most likely eventuality is that the lawmakers will not pass any legislation favored by Governor Fuller.

A line of attack is being laid intended to show that so many legislators own Boston Elevated stock in their own rights, or are related to people who own such stock, that many of them would be disqualified from voting on any Boston Elevated legislation this year. It is not understood that the law forbids voting under such circumstances, but there are rules and precedents to cite against it.

Joseph B. Eastman of the Interstate Commerce Commission has agreed to address the committees on Feb. 23 on the situation.

Safety Record in Kansas City

In all 437 employees of the Kansas City Public Service Company, Kansas City, Mo., finished the year 1927 with clear accident records. The company is now driving for a similar record for the current year. Names and individual records were published in the February issue of the *Railwayan*, the official paper of the company.

Nine-Cent Fare in Baltimore

Service supplied by United Railways declared indispensable. Many improvements to be effected. Commission denounces park tax. Reorganization of financial structure desirable

AN INCREASE in fare from 8 cents cash or two tokens for 15 cents to 9 cents cash or three tokens for 25 cents has been granted the United Railways & Electric Company, Baltimore, by the Maryland Public Service Commission. At the same time the children's fare rate was increased from 4 cents to 5 cents. No change was made in school commutation or other rates. By the same order the company is to extend the first fare zone on the Halethorpe line to the terminus of the line, making one fare to and from that place instead of two. The change in fare rates became effective at midnight Feb. 12. Whether the rate will be accepted by the United has not been determined and will not be decided upon until officials hold a series of conferences with their legal representatives. The company's application was for a flat 10-cent rate. In handing down the decision the Public Service Commission said officially that with the increased rate it would expect the company to improve its service forthwith, to decrease the headway between the cars and to effect as rapidly as possible other improvements necessary for proper service to the public.

The position of the commission in the matter was set down as follows:

So long as the company is performing a necessary service it is entitled to be compensated for that service by an amount which will cover its costs, and will yield a fair profit on the use of its property, and this commission will authorize the company to collect a rate which will yield that cost and profit, so long as it is reasonable and no more than the commission feels the service is worth to the public. But the company cannot depend upon regulation and increasing rates to save it from ultimate disaster, if, because of the automobile, or any other new agency of transportation, its service becomes obsolete, and the use of that service is confined to comparatively few people. The company has been protected from jitney competition and its rates have heretofore been raised to meet increasing costs of rendering service, but there is a limit beyond which the commission cannot go in permitting higher rates to meet, not increasing costs of doing business, but failure to earn a sufficient return, due to the falling off of business.

In a lengthy opinion handed down with the order, the commission set forth an estimated return for 1928 under the new fare rate, allowing for a 2 per cent falling off in full fares. The rate of return was given as 6.26 per cent.

The commission recently reduced the value of the United's easements from $7,000,000 to $5,000,000, bringing the value of the company's property to $75,000,000, and it was this last-named figure that was used as the base for calculating the return.

It was said by the commission that it believed the falling off in riding was due, not to the amount of the fare, but in part to the slump in business and in still larger part to the more general use of automobiles. This automobile competition, the commission said, promised to be greater this year than it was last. "Much has been said about the loss of the short rider and this is often attributed to the price of the car ride," said the commission. "This may be true in some cases, but it does not appear to be so with a great many. To the extent that the short rider has been lost, this loss is due, it seems to the commission, not so much to the cost of the ride but to the length of time the ride itself takes. This is due to the congestion in the streets, caused by the automobile which not only cuts into the revenues of the company but slows up the operation of the street cars, so that an ordinarily vigorous person frequently can walk through the congested business section in less time than he can make the journey on a street car. With automobiles parked on each side of a street all traffic is forced on the car tracks, slowing up the cars and making street car operation more costly, for the slower the cars run,

Digitized by Google

the more expensive it is to operate them."

A controversy between Mayor William F. Broening and Harold S. West, chairman of the commission, was brought about by the commission's discussion of the park tax paid to the city by the United. The Mayor contended that the part of the opinion dealing with this subject was gratuitious criticism and difficult to understand. According to the opinion an element in the railway situation which resulted in higher fares was the park tax. It was purely and simply a tax on the street car riders for the support of the city parks. The company did not pay it. It was paid by the riders and the company simply acted as a collector, receiving approximately one-half cent on each fare the rider paid and turning the money over to the city quarterly. It was, perhaps, a tax on the company in former years, but now it was an expense which must be deducted before any rate of return is calculated. The result was that for the maintenance of parks, stadium, swimming pools, tennis courts, golf courses, baseball fields and park roads, maintained for automobilists, car riders have contributed since 1910, when the company was put under Public Service Commission regulation, the sum of $15,406,794. This, of course, is in addition to the general taxes and such special charges as those made for street paving and for maintaining the paving between the tracks and for two feet on each side.

The opinion stated that an arrangement might be made by which the city would consent to the passage of an act reducing the amount of the tax 1 per cent a year, which would gradually relieve the street car riders of this burden and wipe it out entirely in a period of nine years.

Significant in the opinion was the statement that the service rendered by the company was a necessary and vital thing to the people of Baltimore. This was indicated by the fact that the demand upon the system during morning and evening rush hours was almost greater than the company could meet. Time was when the service was used for pleasure. The motor car has largely taken the place of the street car for pleasure riding. The street cars are used only by those who find them necessary or convenient to get to and from places of employment, or for other trips about the city. It would be practically impossible for all the people who use the street cars to reach their places of business or employment, and return to their homes, by any other means of transportation now available. And if the service is necessary to them they cannot expect to be transported for less than the cost of transporting them, plus a fair return for the use of the agency of transportation. Even at somewhat increased cost it still would be the *cheapest* form of transportation the people could get.

That the extension of the railway system into the suburbs has resulted in the development of the sections which the lines serve is beyond question. Even in these days of almost universal use of the automobile, property values, except perhaps in that part of the city as it existed prior to the annexation of 1888, are dependent largely upon street railway transportation. Withdrawal or material curtailment of service would be felt immediately in the lowering of real estate values, for there is no transportation agency which would give so comprehensive a service at such low cost.

Moreover, the development of property and the creation of higher values along the outlying lines of the company often have been largely at the *expense* of the company. While creating increased values in land by the extension of its lines and service, thus benefiting immediately the property owner (and the city and county by increasing the taxable basis), the company has no way of sharing in the increased values it creates until the time comes when there is sufficient development in new territory to produce enough traffic to make the operation of the lines compensatory. Until that time is reached, the company is compelled to give service to new territory at a loss.

One reason for the company's plight today the commission believed was the fact that following annexation in 1918, the city zones on the street car system were extended to the new city line, this line for nearly the entire distance around the city having been extended about two miles. Annexation, while a desirable thing for the city, did not benefit the railways. It imposed additional obligations upon it, and when extensions of fare zones were made it caused extensive loss of revenue which had to be made up through rate increases. In fact, taking all things into consideration including auxiliary bus lines and the like, the commission believed that car riders as a whole today received relatively much more for the fare they paid than they ever received for a 5-cent fare.

In the opinion of the commission Counsel Toole's theory that the company should be forced into a receivership where a proper reorganization could be effected would mean no good but much harm to the car rider and the whole community.

The commission does not believe that the company's credit can be permanently bolstered up or maintained by the payment of dividends as long as its financial set up remains as at present. It says the structure is top heavy. There are too many bonds outstanding in proportion to the stock. The stockholders have too small an equity in the property. Including its notes, the company has outstanding $67,176,200 in securities representing funded debt and $20,461,200 in stock. Not only is the par value of these securities $12,637,400 in excess of the value of the property as fixed by the commission, but the ratio of funded debt to total capitalization is approximately 76 per cent. The ratio of funded debt to value of the property found by the commission is approximately 90 per cent. The commission believes that the ratio of debt to stock ought not to be greater in a company of this sort than 67 to 33, and does not believe its credit can be permanently established and maintained until approximately this ratio is created. It is of the opinion that the par value of the securities ought not to exceed the value of the property as found by the commission, and, for safety, should be even less than the value found. The commission says:

> It must be remembered that the value of this property was established largely on present-day costs, which had increased very much in the years immediately preceding the valuation. The time may come when reduced costs of reproduction may necessitate a lower valuation, in which event, if the par value of securities is now scaled down only to the commission value, the company again may find itself in the position it now is in; that is, with securities outstanding exceeding in par value the then value of the property.

According to the commission there

ESTIMATE OF RESULT UNDER NEW RATES IN BALTIMORE

			Number of Passengers		Revenues
Cash Fare	@ 9	cents	7,180,730		$646,226
Token Fare	8½	cents	191,753,540		15,979,461
Total full fares			198,934,270		$16,625,727
First county zone	@ 4½	cents	2,600,000		117,000
Second county zone	5	cents	270,000		13,500
Third county zone	5	cents	45,000		2,250
Bethlehem steel tickets	5	cents	1,600,000		80,000
Miscellaneous	..		8,000		400
Half fares	5	cents	8,080,000		404,000
School	5	cents	3,860,000		193,000
Total			215,397,270		$17,435,877
Other revenue					235,000
Total operating revenue					$17,670,877
Operating expenses				$10,303,944	
Depreciation				883,544	
Taxes					
Property				487,110	
Park tax				1,168,204	
Income tax				138,469	12,981,271
Operating income					$4,689,606
Non-operating income					171,000
Gross income					$4,860,606
Deductions from gross income					3,445,000
Net income					$1,415,606
Amount available for return					$4,731,606
Per cent of return on base of $75,000,000.00, per cent					6.31
Deduct $40,000 from gross revenues for Halethorpe zone extension, giving a rate of return of, per cent					6.26

Digitized by Google

are other defects in the company's financial structure in addition to the disproportionate ratio of bonds to stock. It is admitted that under present conditions the company cannot sell junior securities, such as preferred and common stock, to obtain money for capital expenditures. Nor can it issue bonds on the property of The United Railways & Electric Company of Baltimore in order to secure new capital, because the company has a closed mortgage and any new property obtained is immediately covered by that mortgage. For such new capital as it may obtain and for which it must issue bonds it must adopt the expedient of issuing these bonds in the name of a subsidiary, The Maryland Electric Railways, procuring property with that money, and then leasing the property to the United for a sufficient sum to pay the interest on the bonds and provide for their retirement at maturity. The commission says:

A reorganization of the financial structure of the company would naturally result in the substitution of a more flexible mortgage for the old closed mortgage. This would enable the company to provide for its capital requirements by the issuance of new securities as new property is required, on the basis, perhaps, of 67 per cent of bonds and 33 per cent of stock.

While the commission recognizes it has not the authority to order any such reorganization as is here outlined, it trusts that the company will take the problem under earnest consideration and work out a plan of financial reorganization that will help solve its difficulties concerning credits. The commission said:

In every rate hearing in which an increase has been asked, emphasis has been laid upon the importance of establishing a rate which would sustain the company's credit, and which would enable it to borrow money for its capital expenditures at lower rates. Recently emphasis has been laid upon the paying of dividends in order to maintain credit, and increase the borrowing capacity of the company. The commission did not believe credit was helped by paying dividends out of surplus when they have not been earned, and by distributing the money held in the surplus account to the stockholders, from which it cannot be recovered, rather than retaining it in the surplus account where it is, at least, an actual, tangible basis for credit. The commission has no comment to make upon the statement that money in the surplus account actually belongs to the stockholders, and that it is the right of the stockholders to have it paid to them in dividends. So does the surplus actually paid in by the stockholders of a bank belong to such security holders, but it is not paid back to them in dividends, particularly when earnings are low, as a means of maintaining the bank's credit.

In any rate of fare allowed, out of which dividends may be paid, it is not allowing that amount for the payment of dividends for the sake of maintaining the company's credit, but because the company is entitled to that amount of surplus as a matter of right; and the company, in the exercise of its own discretion can pay it out in dividends or retain it in its surplus account.

Of the value on which the return is computed the commission said:

In Case No. 533, decided on Feb. 1, 1928, the commission fixed the value of the company's property at $75,000,000 as of Dec. 31, 1923, of which sum $5,000,000 was for easements. The company claimed that, subsequent to the date of the valuation, net additions had been made which would add $1,005,270 to the above value. People's counsel, questioning the amount of increased valued claimed by the company, attacked the bookkeeping methods of accounting for additions where old trackwork is replaced and declared that the $1,005,270 should be nearer $200,000. His witnesses also pointed out that a decrease in construction costs had taken place between 1923 and 1927 and that this factor, if given the same weight as was given the cost of reproduction by the commission in fixing its value, would tend to indicate a decrease rather than an increase in the 1923 value. In considering all facts which to it seem relevant and particularly, as the relatively small amount in dispute might easily be offset by a slight fluctuation in price levels, the commission is of the opinion that the proper value to be used, at the present time, as a test of the reasonableness of the rates to be fixed in this proceeding, is $75,000,000.

The new fare rate created chaos for the first two days it was in effect. Almost all the 2,500,000 tokens the company has, had been hoarded by the riders, who had purchased them for 7½ cents. It was expected that when the new rate became effective these would come back immediately. But they did not.

Almost all persons boarding the cars offered to buy tokens but the conductors were unable to supply them. Under the circumstances the Public Service Commission ordered that 8 cents be paid as the cash fare. But in many instances the conductors were unable to make change and the patrons in many cases paid fare of only 5 cents.

In order to meet the situation the United wired an order for an additional 1,000,000 tokens, to be supplied in lots of 100,000. But two days later the old tokens began to return to the company and there were few cases where conductors were unable to supply them. The entire situation is now becoming straightened out.

Weather Bureau in Gary Run by Railway

A new and unusual service to the public was recently started by the Gary Railways in the form of an official weather bureau for the city of Gary, Ind. Several weeks ago the company purchased a complete set of weather recording instruments in order to obtain accurate information in advance of storms, thus being able to muster its track forces in time to keep snow and ice from interferring with operations and incidentally to anticipate a considerable saving on storm-fighting equipment.

Conceiving the idea of making the information available to the public, the company made an agreement with the Gary *Post-Tribune*, the local daily newspaper, to furnish local temperature and barometer readings each day on the front page of the paper in a "weather column." The name of the company appears in a credit line at the top of the column.

Paving Exemption Included in East St. Louis Franchise

A petition presented to the East St. Louis, Ill., City Council on Feb. 7 by the East St. Louis & Suburban Railway asking for a twenty-year franchise for its State Street line contained a clause exempting the company from paving between the tracks from 20th to 21st Streets. The company also asked that the franchise be transferred to the East St. Louis Railway. This follows the plan for the construction of a reinforced concrete viaduct to carry the terminal railroad belt line tracks over State Street. The steam railroad would pay for the viaduct, the city for depressing the street and the electric railway would defray cost of relaying its tracks. The main carhouse of the East St. Louis & Suburban Railway is near by and the cost to that company would be about $60,000. If the City Council passes the new franchise it will be submitted to a vote of the citizens.

More Moves to Restore Service in Columbia

Several legal moves have been made in the transportation muddle in Columbia, S. C., within the past few days, but no street cars have moved, nor buses, and, except for the unregulated 10-cent jitney, the city is without any system of public transportation. The street cars, operated by the Columbia Railway Gas & Electric Company, were withdrawn in March, 1927, and the buses were in operation until midnight, Dec. 31, 1927, when they too were withdrawn, leaving the field entirely to the jitneys.

The Columbia City Council passed an ordinance directing the Broad River Power Company—the concern which furnishes power, light and gas to the city—to operate the cars. The Broad River Power Company disclaimed any responsibility in the matter and the Columbia Railway Gas & Electric Company then went into bankruptcy. A federal judge granted a stay of all proceedings involving in any way the property of the Columbia Railway Gas & Electric Company, which owns the lines, rails and equipment. Attorneys for the state and city have filed a petition to have the bankruptcy order vacated. Arguments on this matter will be heard in March.

Meanwhile a bill has been introduced in the General Assembly, now in session, to give the Columbia City Council full control over the city streets—a bill which, it is believed, will drive the jitneys off the principal streets. The jitney union wants the bill killed. Labor leaders contend that no public transportation system can be successful unless it has the support of labor. They want union men put in charge of buses or street cars or whatever may be put on the streets.

And so the people look to the jitney, at present, for transportation.

Chicago Rapid Transit Petitions for 10-Cent Fare

Evidence bearing on the application filed by the Chicago Rapid Transit Company for an increase in fare to a flat 10-cent rate was heard by the Illinois Commerce Commission in Chicago on Feb. 14. The company is asking for the abolition of the three-for-a-quarter tickets and the $1.25 weekly pass in Chicago, Oak Park, Forest Park, Cicero and Berwyn. The existing fares of 3 cents for children more than seven and under twelve and of 5 cents for school children under seventeen years as well as the 25-cent round trip rates to Evanston, Niles Center and Westchester will remain the same. The new cash fare of ten cents which would increase the company's gross revenue about $3,845,000 annually, will automatically become effective within 30 days unless the commission orders a public hearing on the reasonableness of the new rate.

Formal announcement of the application for a higher fare was made by vice-president Bernard J. Fallon, coincident with the issuance of the company's annual report to stockholders. The additional revenue is needed by the company Mr. Fallon said for the purpose of acquiring additional equipment, renewing present equipment, making necessary improvements and to provide a reasonable return on the capital investment of the company.

He maintained that although traffic had increased from 204,000,000 passengers in 1923 to 226,000,000 in 1927, the return on the appraised value had been only 3.5 per cent last year. In that period the company put more than $6,000,000 of new capital into the property.

The hourly wage increase of 1 cent which was granted elevated trainmen last month as a result of prolonged arbitration was also set forth by Mr. Fallon as an additional expense.

Commenting on the proposed fight to be waged by the city, David H. Jackson, chairman of the Illinois Commerce Commission, declared that the rate would not be allowed for at least 120 days in order to give interested parties time to make investigations. He added that there might be a second suspension of six months if the case were not concluded during the first four months.

Bon Voyage to Engineers!

A vacation in Europe, combined with the study of engineering and industrial problems under the direction of experts, is an attraction for this summer under the direction of Prof. N. C. Miller, director of University Extension Division, Rutgers University, State University of New Jersey and of the School of Foreign Travel, New York City. The tour is designed for factory and public utility executives, instructors and students in engineering colleges, and others interested in business, industrial and engineering problems, who wish to study these subjects and at the same time have the opportunity of seeing the various problems treated in Europe. The itinerary has been planned to give the widest contact possible to the leading industrial sections of England, Belgium, Germany and France. College credit can be gained in industrial engineering and mechanical engineering if desired.

The price is $570, which covers a period from July 14, the sailing date, to Aug. 24, when the tour is expected back in New York. Detailed information regarding the specific outlines of the courses and arrangements for University credits may be had by writing to N. C. Miller, Rutgers University, New Brunswick, N. J., or to School of Foreign Travel, Inc., 110 East 42d Street, New York City.

Interborough Case in Courts

State Supreme Court, at instance of city and Transit Commission, issues injunctions against fare increase as railway starts federal action

BOTH sides in the 5-cent fare controversy in New York City appealed to the courts on Feb. 14. In doing this the Interborough Rapid Transit Company, which has filed a new 7-cent schedule effective March 3, next, made good its threat to go to the federal courts for relief. The company sets forth that the 5-cent fare is in violation of the federal constitution in that it is confiscatory. It asked the court for a decree enjoining the city from enforcing the 5-cent fare provision.

City and Commission Make Move

The city and the New York Transit Commission, later in the day, went into the Supreme Court of the state and were granted three temporary injunctions, all returnable on Feb. 20, designed to prevent the Interborough from charging more than a 5-cent fare. The State Transit Commission, at a special meeting, rejected the Interborough's new 7-cent fare tariff and dismissed the application for the higher rate.

No injunction was asked by the Interborough because none was needed until such time as the new rate of fare becomes effective on March 3 and then, if the city seeks to restrain the company from putting the fare in effect, the Interborough will seek intervention of the federal court through an injunction. If granted this would permit exercising of the new rate schedule until such time as the equity of the situation, reasonableness of the fare and company's claim of confiscation under the 5-cent schedule, is settled by the federal court. If the injunction is granted the company, a procedure similar to that of the gas rate cases would apply. This would involve naming a master to hear testimony and report back to the court. Then, if the company proves its case before the master and the court approves the master's report a permanent injunction would follow. After this, if the city desired, it would appeal on up to the United States Supreme Court.

As to the effectiveness of the state court's injunctions, presuming they are made permanent after the Feb. 20 hearing, legal opinion is that this will be a matter for the federal court to decide, i.e., whether the state court's injunction is valid in view of the equity bill placed before the federal courts on the ground of the 5-cent rate being in violation of the federal constitution.

The injunction orders were issued in the Supreme Court of New York County by Supreme Court Justice Edward J. Glennon. Three suits are filed, one by the city asking the court to compel the Interborough Rapid Transit Company to observe the rights of the city under the dual contract and to enjoin the company from raising the present rate of fare. The second action, which covers approximately the same points, was filed by the Transit Commission in behalf of the city. The third action is a special action brought under the public service laws designed to prevent violations of the law when threatened.

The Interborough filed suit in the federal court against the Transit Commission and the city of New York in its fight to obtain a 7-cent fare. The company asks the federal court for a decree enjoining the city from enforcing the 5-cent fare provision of the dual contract on the ground it is confiscatory.

It asks similar decrees against the order of the Transit Commission providing for the lengthening of station platforms at the company's expense and directing the purchase of 432 new cars. A further decree is asked to prevent the city from moving to seize or operate the company's lines.

By this move the Interborough Rapid Transit Company is believed to have brought the entire mass of transit litigation into the jurisdiction of the federal courts. The normal procedure will be for a motion date to be set on which the court will hear argument on the motion of the company for a temporary restraining order.

Senator Philip M. Kleinfield has introduced a bill at Albany providing for a transit authority to take over and operate existing rapid transit lines and build new ones. It would have power to issue bonds for construction of new transit facilities, and the only restriction placed upon it requires that a fare not to exceed 5 cents could be charged. No jurisdiction over existing transportation facilities or those under construction is given the proposed organization, but it would have control over future facilities.

Hearing in Ottawa Set

Hearing on the petition of the Ottawa Electric Railway, Ottawa, Ont., for an 8-cent fare or seven tickets for 50 cents will be held before the Board of Railway Commissioners on March 21. The case for the city of Ottawa, which is opposing the application, will be presented later. The present fare is 5 cents.

For Distribution on Rochester Cars

The *Trolley Riders' News,* a tiny newspaper issued bi-weekly by the New York State Railways, Rochester lines, made its appearance on the street cars of Rochester on Feb. 1. The aims of the new publication, which is along the lines of similar organs in other large cities, are told in the following paragraph in the initial issue:

This is the first number of a new publication dedicated to our trolley patrons in Rochester. In addition to being published in the interest of public safety, it will bring before you interesting news of the trolley world and acquaint you with important facts about the street car.

Leon R. Brown, safety director of the railways in Rochester, is editor of the new sheet. Mr. Brown is also editor of the railways' house organ, *Transportation.*

A Challenge to Stone & Webster Employees

A design and slogan are wanted by Stone & Webster, Inc., which with appropriate wording might be used as a standard trademark for advertising purposes.

Its letter runs in part as follows:

The wording used in our present advertising is "Design, Build, Operate, Finance." Perhaps some one can suggest something else. It must consist of very few words, must be in keeping with best traditions of an organization of our size, and should tell a big story in a brief, forceful manner.

It is probable that this want can be supplied by the members of our own family and suggestions from everybody will be welcomed.

Action on Chicago Bills Awaited

Drafts of legislative bills providing for the consolidation of the traction companies of Chicago and the establishment of the terminable permit now pending before the Chicago City Council local transportation committee have been approved by representatives of the companies. The committee has begun discussion of the new drafts of these bills and also of the other bills pending for the proposed settlement of the traction situation. Action is expected within a short time. Mayor William Hale Thompson and Governor Len Small have reached an agreement whereby the Mayor will support the Governor in the coming April primary as the result of an understanding on several things Chicago wants. One of these is traction legislation and the Governor has agreed to call a special session of the Legislature soon after the primary in case the city and the companies reach an agreement on the terms of the proposed legislation.

Parking Areas in Philadelphia Declared Popular

The auto-parking areas of the Philadelphia Rapid Transit Company at the suburban terminals of the Market-Frankford elevated line in Philadelphia, Pa., have proved popular. A fee of 25 cents is charged for all-day parking, which includes a ride downtown and back. Thus 209,000 automobiles were kept out of the downtown streets during 1927. This proves beyond question, according to the company officials, the usefulness of this service to the individual motorists living tributary to the high-speed lines.

Red Apparel in Richmond Means Danger

Brilliant red suits will soon become the regulation attire of employees of the Virginia Electric & Power Company, Richmond, Va., who work on tracks in the streets. The decision to dress the men conspicuously was reached following a series of accidents in which track employees were struck by automobiles.

In an attempt to reduce the number of accidents on the Richmond-Petersburg Turnpike, which is traversed by the Richmond-Petersburg interurban electric railway, the fronts of interurban cars will be illuminated by floodlights. It has been found that automobilists, seeing the one headlight of an approaching electric car, mistake it for the light of a motorcycle, and assume they can cross the tracks safely.

In Michigan Transporting Furniture Becomes a Science

An unusual consignment in the transportation of furniture was accomplished recently by the Michigan Railroad. Fifteen carloads of furniture loaded at Saginaw, Mich., and destined for Battle Creek, Mich., were transported as a single shipment via the company's lines.

Railway Matter Reopened in Toledo

Efforts are being made to bring together the members of the Board of Street Railway Control, representatives of the Community Traction Company, and Mayor W. T. Jackson and cabinet members at a meeting in the near future to discuss the railway situation in Toledo, Ohio, with a special view to a solution of the power rate issue, determining a program of repaving of car-track streets, and also discussing the possibilities of a revision of the Milner service-at-cost franchise.

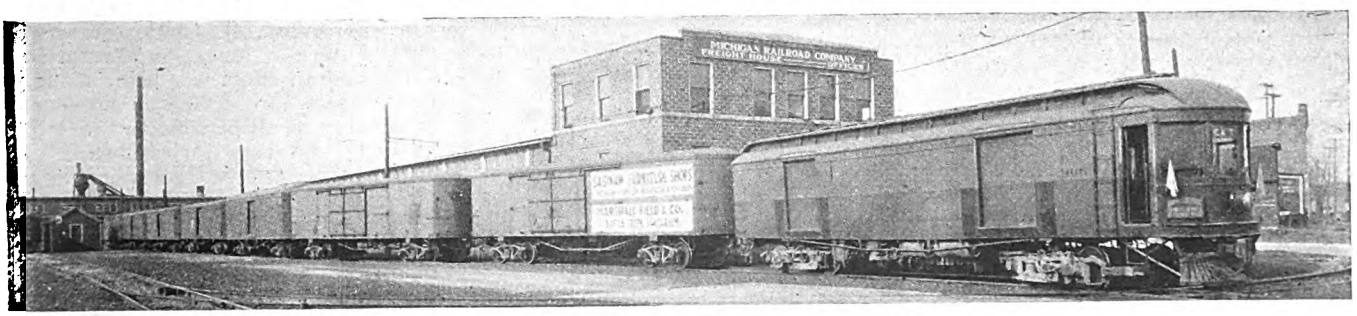
Incidentally it is expected the railway situation in Toledo will assume a different character the first week in March when under the terms of the present franchise ordinance the sinking fund payments will cease.

Through the operation of the sinking fund, 20 per cent of the capital value will have been retired. Under this plan, during the little more than six years' operation under the franchise approximately $1,800,000 of the 6 per cent bonds of the company have been retired and an equivalent par amount of common stock issued to the city of Toledo.

But the noteworthy feature of the suspension of the sinking fund will be the effect on income and outgo of the company. A difference of nearly $28,000 a month will result and this is almost enough to throw operations from red into black as regards the stabilizing fund.

In view of this fact and the results obtained in recent months in the cutting of expenses of operation to the minimum by the management, the railway board members have asked Mayor Jackson to look into the power situation. A power rate has never been definitely established and agreed upon since the operation of the ordinance. It is pointed out that company officials agreed to a revision of the rate in recent franchise negotiations. The power problem will probably be a means of opening up negotiations with the new city administration on the whole franchise matter. The possibility still exists that if the power rate matter can be adjusted the board may favor working along under the present ordinance to ascertain the results of operation without the burden of the sinking fund.

While more than $1,800,000 has been set aside for sinking fund purposes the company has gone in red on its stabilizing fund $1,272,369.



Fifteen carloads of furniture made up this unusual shipment

Bay City May Walk Again

After having lost its railways in 1921, Bay City, Mich., now is threatened with the loss of the bus service, upon which it has depended since that time. Allen B. Doran, bus line operator, refused to comply with a recommendation to have nothing but new buses on the streets. Bus line operators appeared before the City Commission and stated they could not afford to operate the buses on a 5-cent fare. Mr. Doran asked the commission to allow him to operate his buses as long as they were in good condition. City officials told him that with no franchise they could put him off the streets at any time. He predicted that all city bus lines would fail.

Fare Schedule at Poughkeepsie Changed

The Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., has, with the approval of the Public Service Commission, arranged to sell a weekly commutation ticket book with coupons attached equivalent to 12 rides in and between the city of Poughkeepsie and the village of Wappingers Falls for $1.75. Tickets will be honored during the week for which sold (Sundays excluded). The sale of monthly commutation ticket book (52 rides for $7.80), for transportation in and between city of Poughkeepsie and village of Wappingers Falls, has been discontinued.

Chicago Judge Denies Injunction Against Parking Ban

Under a ruling of Municipal Court Judge Oscar Hebel on Feb. 11, opponents of the no-parking ordinance in the downtown loop district of Chicago, were denied a temporary injunction against the regulation. Attorneys for the petitioners, who for the most part consist of small shop owners and restaurant proprietors, immediately asked permission to file an amended bill, arguing that the parking ban is a detriment to "loop" business. One week was granted by Judge Hebel for an amended petition to be filed. It was said by court representatives that the taking of testimony on the new petition will require about 60 days, during which time the ordinance will remain in effect, thus giving it more than the three months' tests which were urged by proponents at the time the law was enforced on Jan. 10.

Boost Railway Idea in McAlester

An organization of employees formed to put the Pittsburg County Railway before the public is the talk of the hour in McAlester, Okla. Regular monthly meetings are held at which plans for promoting the welfare of the company are discussed. The slogan adopted by the organization is "ask any Pittsburg County railway employee." W. H. Goodner, promoter of the club, said that the organization desired the public to know that whatever information it wanted, especially if it were something pertaining to transportation, the information was to be had for the asking.

Madison's Future Uncertain

The City Council of Madison, Wis., has voted 16 to 4 to submit a referendum to the people at the election in April on the question of the city's taking over the Madison Railways. This action is the outgrowth of an increase in fares allowed by the Wisconsin Railroad Commission and also the charge by the commission that the financial statement of the company contained an incorrect entry.

Since the charge was made, F. W. Montgomery, president of the company, explains that in 1921 he canceled an advance of $73,951 which he made to the company, and that in 1924 the board of directors felt he was too liberal in foregoing the payment of this amount and voted that the company should repay the sum. Mr. Montgomery said:

Neither I nor other officers regarded this action as creating a liability in such a way as to make it necessary to enter this item on the books of account.

Learning that the Railroad Commission construed this transaction as a liability which should have been entered on the books, the board of directors at my request has rescinded and annulled the resolution of 1924 and has canceled said item of $73,951 and I have returned to the treasury of the company everything which I have received pursuant to the resolution of 1924.

Something New in Free Rides in Buffalo

Members of the Rotary Club of Buffalo, N. Y., and the Greater Buffalo Advertising Club received a poetic token and an actual token from the International Railway during the past Christmas season. The street car token was glued or stapled to a card 6½ in. x 4 in., with a poem printed in green and signed "I.R.C. Men and Management."

The poem ran as follows:

Here is a token of warmest good will
From those at your service, good weather or ill;
They'll carry you quickly, at any old time,
To business or pleasure, for less than a dime;
And whether your purpose be labor or lark,
There's this great advantage—you don't have to park.
Through mazes of traffic your way we will wend,
While you read your paper, or chat with a friend.
Man, it's even a cure-all for family strife—
You can leave your car home for your good friend, the wife.
As for service—we'll tell you what everyone knows—
The more that you use it, the better it grows!

Courtesy in Dallas

A courtesy campaign among its trainmen has been launched by the Dallas Railway & Terminal Company, Dallas, Tex. "The passenger is always right" is the slogan that has been adopted by George I. Plummer, superintendent of traffic. "Always treat a passenger as you would want a member of your own family treated," Mr. Plummer told the trainmen at a recent meeting held to acquaint the men with the details of the courtesy campaign. It is planned to continue the campaign for one month, during which reports will be studied.

The Contribution of the Utility to the Community

In a series of fifteen full-page educational advertisements in the New York *Times Annalist*, the Penn-Ohio Edison Company is discussing the important places the utilities occupy as integral parts of the communities they serve. Since the Penn-Ohio Edison Company's subsidiaries supply the district about Youngstown, Ohio, and New Castle, Pa., with electric light and power service, and electric railway and bus service, the advertisements tell of the growth of the Youngstown district and of the contribution made to that growth by the public utility service.

Emphasis is placed by the company on good service, good public relations, safety of investment, and public confidence. One of the advertisements is devoted to "Gold Medal Transportation," the heading being inspired by the fact that the electric railway lines of the Pennsylvania-Ohio Electric Company, a subsidiary, won the Charles A. Coffin gold medal and award for 1926. Ray P. Stevens, president of the American Electric Railway Association, is president of the Penn-Ohio Edison Company.

Mirrors and Improved Dressing Rooms for St. Louis Employees

Motormen and conductors of the St. Louis Public Service Company are to be provided with improved dressing rooms equipped with full-length mirrors to "dress up" prior to taking their cars on the road. This innovation in transportation circles was advocated by Stanley Clarke, executive vice-president of the company, at a meeting of the Engineers Club of St. Louis on Feb. 8. The subject of Mr. Clarke's talk was "The Future of Mass Transportation."

He said an effort was being made to make street car service an acceptable commodity to all persons and to sell it as such. "A very forward start," he claimed, "toward better service is the 'dressing up' of the operating staff.

Sunday pass sales numbered 20,408 on Jan. 15 and increased each Sunday thereafter through Feb. 12. For Jan. 22 the record showed 26,398; Jan. 29, 28,931; Feb. 5, 30,161, and Feb. 12, 35,360.

Recent Bus Developments

Eighty Cents for Texas Bus Trip

The application of the Texas Motor Coaches, Inc., Fort Worth, for authority to increase its one-way bus passenger rate between Fort Worth and Dallas, 35 miles, from 50 cents to more than $1 has been denied by the Texas Railroad Commission. The commission prescribed a fare of 80 cents for the trip. In its order the commission made it clear that this rate is not necessarily a precedent to guide adjustments, because state regulation of bus lines is not old enough to allow determination of a basic cost of operation.

The Fort Worth-Dallas rate was ordered on the stipulation that the company put on modern, up-to-date equipment within 30 days on the penalty of cancellation of the increased fare. The round-trip rate was set at $1.45, good for return in ten days. The minimum fare between any two points was made 25 cents. The commission held the company's valuation of $308,000 to be too high.

Electric railway fare between the two cities is approximately 90 cents. The Texas Motor Coaches, Inc., as organized in 1927, is under sponsorship of the Northern Texas Traction Company.

Petition in Chattanooga Includes Bus Service

At a recent hearing before the Tennessee Railroad & Public Utilities Commission, the Tennessee Electric Power Company agreed to start a bus line to accommodate the Red Bank patrons of Chattanooga and promised to give transfers over its cars and bus lines within the city of Chattanooga. A franchise for such bus operation has been granted the company by the city of Chattanooga, and also the county of Hamilton. Bus service was suggested by the company at recent hearings when the company petitioned to abandon service to Red Bank. At a previous hearing permission was denied.

Chicago-Gary Coaches Compete

One-way fares on coaches of the Shore Line Motor Coach Company operating between Gary and 63rd Street, Chicago, were cut from 50 cents to 30 cents on Feb. 1. The following day, the Midwest Motor Coach Company, which also operates between these two points, announced a like reduction. Later in the week, the Shore Line Company again lowered its rates successively to 25 cents and 20 cents. The new rates were met immediately by the competing utility. According to officials of the Shore Line Company, which is controlled jointly by the Gary Railways and the Chicago, South Shore & South Bend Railroad, the reductions were made with a view to stimulating the winter traffic.

As the new rate conflict was getting under way the Midwest Company started the operation of a new bus line between Hammond and Chicago with regular 20-minute daily service on a 25-cent fare. The new route is in direct competition both as to service and fare with the Hammond-Chicago line of the Shore Line Motor Coach Company.

Permission for Illinois Bus Routes Sought

A petition has been filed by the Illinois Power & Light Corporation with the Illinois Commerce Commission for authority to establish bus routes between Venice and Lincoln, Springfield and Riverton, and Staunton and Hillsboro, supplementary to the present railway service. The utility, however, says that it does not desire to bid for local business in the Springfield and Lincoln territory now served by the Illinois Power Company and the Lincoln Street Railway.

Interstate Regulation of Motor Carriers Argued

Federal control of common-carrier motor highway vehicles generally favored at Washington hearing. Truck operators oppose proposal

ARGUMENTS were heard by the Interstate Commerce Commission on Feb. 10 on the question of whether it should recommend to Congress legislation providing for a plan of federal regulation of the operation of common-carrier motor highway vehicles in interstate commerce.

The arguments were directed to a proposed report by Attorney-Examiner Leo J. Flynn, of the commission, made public recently following an investigation of bus and truck operation, in which he recommended a plan of federal regulation which would employ state authorities or joint boards of state commissioners as agents of the Interstate Commission, subject to an appeal to the federal commission.

Federal regulation of buses was generally favored by those who presented arguments, but the manufacturers and operators of motor trucks in freight service objected to regulation because it would retard development.

Alfred P. Thom, general counsel of the Association of Railway Executives, which favors federal regulation both of buses and trucks when engaged in interstate commerce, praised Mr. Flynn's proposed report. He urged, however, that there should be but one system of federal regulation, applying alike to subsidiaries of railroads operating buses or trucks, and to carriers not subject to the act to regulate commerce. He said there is no occasion for different treatment of the carriers controlled by railroads. If certificates of public convenience and necessity, issued by the Interstate Commerce Commission, should be required before a railroad may extend its service, as under the present law, he said, he saw no reason why the same requirement should not apply to an extension of service or the operation of a new service by motor vehicle or a joint service by rail and motor vehicle.

A. J. Brosseau, president of Mack Trucks, Inc., and chairman of a special committee representing the manufacturers of motor trucks, opposed the recommendation for regulation of motor truck operations. It is the unanimous judgment of the members of the special committee, after a thorough study, he said, that there is no evidence in the record showing a demand by the shipping public for such regulation or any need for it. He said:

> The bus situation is somewhat different. The best bus service is operated over fixed routes and on definite schedules and the evidence points to the need for some regulation. I hope that you will proceed slowly. Your recommendation to Congress may have the effect of either promoting or retarding the development of this industry.

Mr. Brosseau quoted from a statement by Ralph Budd, president of the Great Northern Railway, which he described as one of the greatest bus operators in the country, in which Mr. Budd urged that the management be left as free as possible while the business is in a stage of development and that the requirement of certificates for interstate operation seems to be the principle thing needed.

R. R. Bradley, representing the American Electric Railway Association, said that the association has been recommending regulation of motor vehicle transportation for the last three years. He said:

> We find the report of the attorney-examiner very comprehensive and fundamentally sound. We feel keenly that there should be some legislation now and amendatory legislation can be added as the need for it develops.

S. A. Markel, counsel for the Bus Division of the American Automobile Association, praised the report of Mr. Flynn as a "remarkable piece of work" and said that speaking for "the fellows who are to be regulated" he was in favor of immediate legislation. He urged, however, that the regulation be simple at first, rather than restrictive. Mr. Markel agreed that the question presents difficulties but thought they could be obviated. He suggested that members of state commissions might sit together as

Digitized by Google

joint boards but that their actual decisions might be rendered in their own states separately.

The principal objection presented by Mr. Markel to the adoption of the examiner's report was in regard to considering of "existing agencies" in granting certificates for operation of bus lines. He declared that if this language is used it means that the effect on the revenue of "transportation agencies" already operating in the territory must first be considered. He made this recommendation for requirements in granting certificates of public convenience and necessity to bus lines:

The law should provide that the fact than an applicant for a certificate of convenience and necessity was in bona fide operation one year prior to the opening date of the legislative session at which the law is passed, and since then and at the time the application is made has been continuously so engaged, shall be considered prima facie evidence as to the convenience and necessity for such operation.

The National Automobile Chamber of Commerce has filed with the commission a statement of exceptions to the attorney-examiner's report, signed by C. C. McChord, R. Granville Curry and Frederick M. Dolan, of counsel, stating that "there is no necessity or public demand for legislation. The time has not yet arrived for federal regulation of the common carrier motor truck."

Proud of Safety Record in Duluth

An enviable safety record has been made by eight motormen of the Duluth Street Railway, Duluth, Minn., during the past few years. One man served ten years without a serious accident. The three leaders in the record-making safety campaign are: Bernt Lodgaard, J. P. Ryan and Alfred Sicotte.

In August, 1926, the company started a campaign of safety among car operators, including city bus drivers, and has divided the operators into ten teams of 26 members. The year, during which the personnel of the teams remains the same, is divided into four quarters and the winning team for each quarter announced. E. T. McManus, head of the claim department, has charge of the contests.

Buses on Cincinnati Parkway

Walter Draper, president of the Cincinnati Street Railway, Cincinnati, Ohio, has sent a formal request to C. O. Sherrill, city manager, for the use of the city's Central Parkway for the operation of buses of the Cincinnati Street Railway. It is anticipated that the application will be granted. The Cincinnati Central Parkway is the down-town surface of the unfinished rapid transit system, completion of which, underground, has been in controversy many years. Mr. Draper recently stated that his company would complete and operate the system if given proper guarantees against loss.

Financial *and* Corporate

Milwaukee Company Does Well

609,417 more passengers carried in 1927 than 1926. Many improvements to transportation units. Slight decrease in net

NET capital expenditures of $6,022,048 were required in 1927 by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., to meet the growing demands for electric heating and transportation services. Net income for the year was $3,966,905 as compared with $4,025,698 in 1926. In its railway utility operations the company has been constantly mindful of its obligation to provide modern and adequate transportation facilities for its patrons. One-man car operation was extended to additional city lines, and more frequent and rapid service was provided on interurban lines. Extension of street railway tracks and service, and considerable track reconstruction work occupied a major part of the railway utility program. The system carried 210,786,573 passengers in 1927. This was an increase of 609,417 over 1926.

Some of the more important development on city lines during the year were:

Extension of street railway tracks and service along Teutonia Avenue from Nash Street to Atkinson Avenue, and along Eighth Avenue from Oklahoma Avenue to Ohio Avenue.

Double tracking of Downer Avenue from Edgewood Avenue to East Capitol Drive, and of Atkinson Avenue from 27th Street to 32d Street.

Improvement of service on the Eighth-Muskego and North Avenue lines by means of electrically heated one-man safety cars.

Rebuilding of the upper portions of the Wells Street railway viaduct.

In addition, the company completed an extensive program of reconstructing tracks and paving track zones in various parts of the city of Milwaukee and suburbs.

An undertaking which commanded the attention of the transportation utility was the completion of another rapid transit line providing more rapid suburban and interurban service on the Burlington and East Troy lines. The service was started by the company on June 20 last year.

The faster service was made possible by utilizing a cutoff extending from West Junction on the Watertown rapid transit line to the East Troy Line at Ninety-third and National Avenues. The cutoff is barely a mile long, but its strategic location together with the improved rapid transit equipment, and the elimination of operation through busy, heavily traveled city streets, have made possible a considerable saving in the running time. Because of this line, faster and more frequent connecting motor coach service to Lake Geneva, Beloit and Janesville was also made possible.

Ten New City Cars

In addition to the forty new cars purchased late in 1926 and placed in service during 1927, ten new city cars were purchased in 1927. These cars are to be used on the State Street line, recently converted to one-man car operation. Innovations in these new cars are genuine leather upholstered seats and greater seating capacity. There are semi-indirect light fixtures, electric heaters, automatic treadle exits, concealed air-control pipes and the latest safety devices, also.

At its Cold Spring shops, the company constructed nineteen de luxe railway coaches for rapid transit service. It purchased also, two large street-car type buses and a number of smaller buses.

The Transportation Training Building was dedicated and put to use during the year. Here prospective trainmen, bus operators and maintenance men are taught their new jobs. In addition to class rooms for "academic" instruction, there are "laboratories" in which new employees gain actual experience with the vehicles they will later operate or repair.

An attractive interurban railway and motor bus terminal was built at Watertown to accommodate the growing popularity of the rapid transit line between Milwaukee and Watertown, with connecting motor coach services to Madison, Janesville and Beaver Dam. The terminal provides commodious shelter, heated waiting rooms and ticket offices and ample facilities for handling baggage and checking of parcels. Transfer between cars and motor coaches is entirely under shelter.

The relations between the employees and the company continue to be satisfactory. The Employees' Mutual Benefit Association now has 6,415 members.

INCOME ACCOUNT OF THE MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY

	1927	1926
Gross Earnings		
Operating revenues	$27,157,902	$26,219,754
Non-operating revenues	349,648	335,348
	$27,507,550	$26,555,102

Digitized by Google

Of special interest to the association was the completion and dedication of its new lodge hall in the Public Service Building.

This association continues to be a very important factor in establishing homes for the employees and their families. Since its inception in April, 1914, the association has provided upwards of $12,793,651 for this purpose. More than 80 per cent of all married, permanent employees own their homes.

During the year $5,378,300 of 6 per cent preferred stock was sold through the company's own securities department, and was distributed widely to customers in the service area. The amount of outstanding 7 per cent preferred stock was increased $268,900 by completion of payments by customers purchasing on the installment plan. North American Edison Company, owner of the entire outstanding common stock of the company, purchased $2,000,000 of additional common stock to provide part of the funds required for additions and extensions to the company's properties.

The increase in funded debt resulted from the issue of $2,500,000 of refunding and first mortgage 5 per cent bonds, series due 1967. The amount of refunding and first mortgage 5 per cent bonds, Series B, increased $2,377,000, due to the issue of such bonds in exchange for outstanding general and refunding mortgage 5 per cent bonds of equal amount.

Utility Bonds Recommended by New York Legislature

Interest was aroused in the financial district recently over the favorable report made by the New York legislative committee on the proposal to extend the list of bonds legal for savings banks and trust companies of the state. It is proposed to extend the list to include a certain proportion of public utility bonds, equipment trust obligations, and certain other changes in the present law are recommended.

In part the report said:

Equipment trust obligations are also deemed to be obligations of such high character that they may safely be recommended for savings bank investment. They cover rolling stock and equipment necessary to the operation of the railroads, which insures that such obligations will be met even though the railroad issuing them should itself become financially involved. It is proposed to admit to the legal list only those equipment trust obligations which are obligations of railroads, the bonds of which are now legal. They must be a first lien on rolling stock, shall not exceed in amount 80 per cent of the cost of such equipment and shall be payable in installments and over a period of not to exceed fifteen years with proper provisions for upkeep, replacement, payment of taxes and other charges.

Bills carrying out the recommendations in the report will be introduced shortly by the committee. Last year this legislation was handled by Assemblyman Willis Sargent of Syracuse. Objections to the proposal from upstate sources are that it would put savings banks in competition with trust companies and would make it difficult for home builders of ordinary means to borrow money from savings banks on mortgages. The contention is that the savings bank deposits would be tied up in public utility securities.

Unification Agreement in District of Columbia

A unification agreement has been signed by the Capital Traction Company, the Washington Railway & Electric Company, and Harley P. Wilson, the owner of 21,237 shares of the stock of the Washington Rapid Transit Company. It is proposed to create a new company to be known as the Capital Transit Company which is to operate the street railways and bus lines which the three companes now are operating in the District of Columbia and near-by regions. The plan for combining these operations must be approved by the Public Service Commission and by Congress. The agreement specifies, however, that each party to the contract is to be restored to complete liberty of action if the plan is not accepted on or before June 1, 1929.

The new company will take over all of the property and outstanding securities of the Capital Traction Company, the 21,237 shares of the Washington Rapid Transit Company and the street railway portion of the business of the Washington Railway & Electric Company. The power business of the company will be continued as a separate entity, but the agreement provides that power is to be furnished the new company at reasonable rates. Initially authorized capital of the new company is to be comprised of 300,000 shares of preferred stock of the par value of $100 per share and 300,000 shares of common stock to have a par value of $100 per share.

This agreement provides for the elimination of the requirement that crossing policemen be paid by the street railway operators. Under the agreement the new company is also to be relieved of the cost of paving streets between its rails.

Operation in Colorado Springs to Continue

The receipts of the Colorado Springs & Interurban Railway, Colorado Springs, Col., are such as to lend hope that with the present economical management, there will be no need to discontinue operation. Some of the heaviest losing lines have been discontinued and in some places buses have been installed, so that operation in 1928 appears assured.

Some time ago the company suggested that the city purchase the railway system and offered it for $500,000, 50 per cent to be paid the company in city bonds. After deliberating the matter for some time the City Council rejected the proposal.

Agreement on B.-M. T. Acquisition Practically Reached

An agreement with representatives of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., Samuel Untermyer, special counsel for the Transit Commission, and John H. Delaney, chairman Board of Transportation, was recently reached practically on all points relating to the acquisition of certain railway property by the city except as to the price to be paid. A bill is being drafted for submission to the Legislature for creation of a transit authority to take over the B.-M. T. lines. The city plans seizure of the Interborough Rapid Transit Company by default under Contract 3 if the company advances fares to 7 cents. Agreement with Manhattan Railway stockholders will be attempted by the city whereby elevated lines would be turned over to the city for operation with the new municipal subway system if the Interborough should be obtained by default.

Surrender of Franchise in Marshall, Texas

The East Texas Public Service Company, subsidiary of the American Public Service Company, which has held the franchise for railway operation in Marshall, Tex., has reached an agreement with the city authorities under which the franchise is to be surrendered to the city. The company is to pay the city $12,000, in return for which it is to be relieved of all further obligation in the operation of street cars, and will also be relieved of the responsibility of removing the car tracks from the streets. This agreement marks the end of the operation of street cars in Marshall. Buses were accordingly operated for some time, but a few months ago announcement was made by the company operating them that the service would be discontinued as it was being operated at a loss.

Brief Filed for Dismissal of City Utilities Company

City Counselor J. T. Muench of St. Louis, Mo., filed with the Missouri Public Service Commission at Jefferson City on Feb. 9 a brief and argument in support of the city's application for a dismissal of the petition of the City Utilities Company of Delaware to acquire and hold 25,000 shares of the preferred, series A, and 170,000 shares of the common stock of the St. Louis Public Service Company. A state law prohibits a foreign corporation from holding more than 10 per cent of the stock of a public utility without the permission of the Public Service Commission. Counselor Muench contends that the Delaware company has failed to obtain a Missouri license and therefore has no legal status in the state, being outside the pale of the commission, which cannot legally entertain the application.

First Dividends to Mitten Bank Securities Holders

Mitten Bank Securities Corporation, Philadelphia, on Feb. 15 paid an initial dividend for the five months period ended Dec. 31, 1927, at the rate of 5 per cent per annum (2.0833 per cent) on the paid-in value of the part-paid common stock of the corporation.

At the same time the company paid an initial dividend for the five months period ended Dec. 31, 1927, at the rate of 6 per cent per annum (2.50 per cent), and an additional dividend at the rate of 1 per cent per annum (0.4167 per cent), the total dividend for the five months period being at the rate of 7 per cent per annum (2.9167 per cent) on the paid-in value of the part paid preferred stock.

Illinois Traction Inter-Company Deal

The Illinois Traction, Inc., has transferred to the Illinois Power & Light Corporation all its properties devoted to the generation and transmission of electrical energy in compliance with the recent decision to centralize all power units with the Illinois Power & Light Corporation, leaving the Traction system in control of transportation activities only. The entire deal is an inter-company transaction. Under the new plan the Illinois Traction has transferred titles to substations in a score of points along its routes with the new lessee authorized to reconstruct, enlarge and replace with steel towers all transmission lines on its right-of-way. All meters and marketing equipment for the sale of current are transferred, the Traction company having furnished power for industries along its line. The Traction line assumes bonds and deeds of trust of the Illinois Power & Light Corporation against the St. Louis, Springfield & Peoria Railroad and other lines involved in a recent merger of Illinois Traction and its subsidiaries. The power house in Peoria is one of the largest units included in the deal.

Meetings on Hocker Rejuvenation

Approximately 400 persons attended a meeting Feb. 2, at Shawnee, Kan., to discuss plans for financing a new company to purchase and resume service on the Hocker line, the defunct Kansas City, Lawrence & Topeka Electric Railroad, which formerly operated between Kansas City and Rose Hill, Kans.

Committees were appointed Feb. 6 to canvass in Monrovia, Rose Hill, and Shawnee for stock subscriptions. The committees will meet in the Shawnee State Bank later to report progress. Another community mass meeting was held in Merriam, Kan., on Feb. 4, to present the project.

• W. K. Paul, manager of the line before it was sold to the Sonken-Galamba Corporation, outlined a plan whereby a new company may be formed if $10,000 in 7 per cent preferred stock is purchased by patrons of the line. When this stock shall have been subscribed the Sonken-Galamba Corporation has agreed to purchase $16,000 in bonds and the Kansas City Public Service Company $15,000 in bonds.

Financial Structure in Fort Wayne to Be Simplified

Plans for the simplification of the capital structure of the Indiana Service Corporation, Fort Wayne, Ind., involve the retirement of approximately $4,800,000 in bonds. Provision has been made for a new mortgage under which $5,000,000 of 5 per cent first lien and refunding mortgage bonds, Series A, due on Feb. 1, 1963, have been issued and sold to Halsey, Stuart & Company, New York and Chicago.

The new capital structure of the corporation will consist of the first and refunding bonds, which now become first mortgage bonds, totaling $7,566,500, the new series of $5,000,000 first lien and refunding 5 per cent bonds, and $145,000 of non-callable underlying divisional bonds which are gradually being exchanged for an equal amount of first mortgage bonds on deposit with the trustees for this purpose.

Changes in Buffalo Financial Structure Are Sought

Stockholders of the International Railway, Buffalo, N. Y., will be asked at a special meeting called for Feb. 20 to approve the issuance of $2,000,000 preferred stock and no par value common stock in exchange for the common stock of $100 par value. Bernard J. Yungbluth, president of the International, says this change is desirable to improve the company's credit position and strengthen its financial structure.

Substitution of no par value stock for $100 par value common now outstanding and the resulting changes in the balance sheet of the railway, have been approved by the Public Service Commission. Application for approval of the proposed issue of preferred stock will be made to the commission concurrently with authorization by the International Railway stockholders.

Mr. Yungbluth said that conditions making these changes desirable had their inception in 1912, when the company mortgaged its property. At that time, according to President Yungbluth, the Public Service Commission ordered the International Railway, to set up on its books an item of $12,651,500 as tangible capital to be amortized over a period of years. Of this amount approximately $4,000,000 has been written off. The company also is carrying on the asset side of its balance sheet an item of $6,000,000 listed as strike expense which should be written off over a period of years and which the present proposed financial plan will permit to be written off at once.

Part of Seattle Loan to Meet Tax

Part of a recent loan of $550,000 from the light department to the Seattle Municipal Railway, Seattle, Wash., will be used to make a first payment on the 1919 railway tax if a bill introduced in the City Council is adopted. The measure provides that the city pay $115,000 next May. The money will go to the Puget Sound Power & Light Company. The total 1919 railway tax was $401,017. Under an agreement, the city was to pay three-fourths, and the company one-fourth. Both the company and the city fought the tax and carried an appeal to the United States Supreme Court, where the tax was finally upheld. As the judgment was levied against the company, it paid the tax, which, with interest, came to $655,279.
